duty that would destroy the export trade in beer. The maximum duties in the Government bill were 6.50 marks on wheat, 6 marks on rye, and 4 marks on barley and oats. The committee adopted the rates of 7.50 marks on wheat and 7 marks on rye, barley, and oats. The tariff scheme did not include maximum and minimum rates for any of the 946 articles excepting cereals. When the scale of duties on grain had been altered against the protests of the ministers by the Tariff Committee, the Government proposed that all the other items should be passed in a lump as a basis of negotiation in making commercial treaties with different countries. The committee, which had rendered the task of negotiating treaties difficult by altering the proposed grain duties, especially in fixing a barley duty that threatened the trade with Austria-Hungary in that article and had placed obstacles in the way of all foreign commerce by requiring a certificate of origin to accompany every invoice, would not yield up its powers so easily. It went on to impose protective duties on all kinds of vegetables, 2 to 4 marks per 100 kilograms, with the object of killing a large trade with Italy and France for the benefit of German gardeners, and similar duties on flowers, fruits, trees, and plants. While the tariff was under discussion the Prussian Minister of Commerce instituted an inquiry into the number, origin, and development of cartels, or industrial trusts, and their economic effects in lowering the cost of production, preventing overproduction, and raising or fixing prices. The potash, coal and coke, and iron cartels were excluded. The coal and iron trades have made an agreement to pay to exporters of iron and steel manufactures the whole difference between the price they realize abroad and the current prices in Germany. Costly plants continued to be erected when the market was glutted with merchandise; yet in the economical use of fuel and material and scientific methods of production, as well as in the cheapness of labor, German iron manufacturers have an advantage over their competitors. When the Socialists on the Tariff Committee proposed to admit free of duty all kinds of goods sold by trusts or rings cheaper abroad than in Germany Count Posadowsky promised a thorough investigation into the operations of rings. It is estimated that 300 cartels, syndicates, and combinations have arisen in Germany within a few years, of which 80 are concerned with trade and 220 with production, including 80 in the metal, 40 in glass and pottery, 30 in the chemical, 20 in the textile, 10 in the coal, 10 in the paper, and 10 in the provision industries. By the rules of the United States Treasury Department import duties on German goods on which a syndicate of manufacturers has paid export bounties are assessed on the prices current in the open market in Germany, not on the reduced export prices. Against this method of valuation Germans have protested, but it is the law.

The Tariff Committee not only raised the proposed duties on live animals from 10 or 12 to 18 marks per 100 kilos, but insisted that this rate should not be lowered more than 20 per cent. in commercial treaties. The Government duties on horses were from 30 to 300 marks; those of the committee vary between 90 and 360 marks. The duty on tea was lowered from 100 to 25 marks. A protective duty was even imposed on milk. The duty on butter and cheese was raised from 20 to 30 marks. The duty on eggs the Agrarians proposed to increase from 2 to 20 marks, although Italy was specially concerned in this item, too. As a sop to the working classes they

abolished the duty on herrings, which the Government desired particularly to maintain so as to foster the deep-sea fisheries, and thus increase the number of seamen available for the navy. The states of south Germany—Württemberg, Baden, Bavaria—were strongly opposed to the enhanced grain duties, which would not benefit even their agriculture. Before accepting the rates fixed by the committee the ministers succeeded in allaying the opposition in this quarter, but if the still higher rates demanded by the Agrarians were granted the Chancellor declared that commercial treaties for long terms could not be concluded. The Socialists exclaimed against the bread usury. All the cities and towns of the empire sent representatives to protest against the duties as disastrous to industry and commerce. The committee reduced the Government duties on various manufactures and raised some to please manufacturers in certain branches of trade, but at the request of ministers the Government schedules were left almost intact in regard to manufactured articles. The tariff bill, still incomplete in the hands of the Reichstag committee, could not be presented before the autumn meeting of the Reichstag. The committee was authorized to continue its deliberations during the recess, and by a special law its members received payment, 2,000 marks each. The bill appropriating money for the purpose was an innovation hailed by the Socialists and the Radicals as the preliminary step to the payment of members of the Reichstag, which they have constantly demanded, while the Government has adhered to Bismarck's idea that salaries would lower the intellectual and social standard of the Reichstag. Meanwhile the unsuitableness of the English precedent to the conditions of public life in Germany has been shown in the increasing difficulty of keeping the members together in sufficient numbers to form a quorum for the transaction of business. When the Prussian Landtag closes its session so many of its members who are also members of the Reichstag and who receive pay as Prussian Deputies leave for their homes that the Reichstag is forced to adjourn. The Reichstag voted to give 30,000 marks to the Colonial Society to establish a bureau for the information of intending emigrants, but not in the form of an annual subsidy, as the Government proposed. The proposal to spend 1,550,000 marks in extending the Tanga and Korogwe Railroad in East Africa to Mombo was rejected by the Budget Committee, which reduced the estimates for 1902 so that they could be balanced by borrowing 112,000,000 marks, instead of 182,000,000 marks, as proposed by the Government. All parties are proportionally represented on the Budget Committee. Still its conclusions are not invariably followed by the Reichstag. The credit of 24,000,000 marks to maintain a garrison of 3,030 men in China was reduced to 20,000,000 marks on the motion of the Radical leader, Eugen Richter. The Government is desirous of building up separate military and naval forces for colonial purposes, and the majority of the representatives of the people are suspicious of proposals which may indirectly further this object. Expenditures for fortresses, siege-artillery, and other military requirements were cut down and other reductions effected so as to save 23,250,000 marks in recurring expenditure. A deficit of 40,000,000 marks was still left, and one of 50,000,000 marks was anticipated for 1903. The railroad revenue in particular had fallen off. The accounts for 1901 showed a deficit of 48,000,000 marks, the income of the Imperial Government having decreased

27,000,000 marks, while expenditure increased 21,000,000 marks. Herr von Thielen, Prussian Minister of Public Works and head of the Imperial Railroad Administration, resigned on June 22, and was succeeded by Major-Gen. Budde.

The dictatorship paragraph in the Constitution of the Reichsland was abolished pursuant to an edict of the Emperor authorizing Prince Hohenlohe-Langenburg, the Statthalter, and the Imperial Chancellor to take steps in the Bundesrath and the Reichstag to effect the repeal. The law of Dec 30, 1871, conferred on the Chief President of the Reichsland power to adopt in the event of danger to the public safety all measures that he considered requisite. He was thereby invested with the same powers that the French law of August, 1849, gave to the military authorities when a state of siege had been declared. In the Constitution of Alsace-Lorraine, adopted in July, 1879, the same law was retained, empowering the Statthalter to employ for police purposes the military garrison, to expel any person, even a born Alsace-Lorrainer or a German, from the Reichsland, to suppress any newspaper, etc. The representatives of Alsace-Lorraine in the Reichstag continually protested against the paragraph until in 1895, and again in 1900, resolutions were passed in favor of its repeal. The Government paid no attention to these resolutions, but finally proposed the elimination of the paragraph as a token of the Emperor's good-will and confidence in the loyalty of the Alsace-Lorrainers to the empire.

The Reichstag Tariff Committee at length reported the bill on Aug. 11. The Clericals on the committee, supported by the Social Democrats, proposed to devote any surplus accruing to the treasury from the tariff to building a fund for the maintenance of widows and orphans, a motion which was lost by 3 votes, although the ministers promised some such scheme for alleviating the pressure of the tariff on the working classes. When the Reichstag reassembled on Oct. 14 and began the discussion of the compromise bill as it came from the committee the Chancellor accepted the altered duties on grain, even the barley duty, and endeavored to conciliate the opponents of higher taxes on the food of the people by expressing a readiness to consider the question of paying members of the Reichstag. The Center, the two Conservative parties, and the National Liberals supported the compromise tariff. The Social Democrats and Radicals used every parliamentary device to prolong the discussion on every clause. When on Nov. 27 only a few clauses had been forced through in the face of this determined obstruction, the leaders of the Government parties moved that the Reichstag, instead of continuing to vote on each clause, vote upon the whole bill. This was contrary to the rules of the house, but President von Ballestrem declared the motion open to debate.

The Emperor excited some distrust and much criticism by a telegram which he sent to the Prince Regent of Bavaria expressing deep indignation at the base ingratitude exhibited by the Bavarian Chamber to the house of Wittelsbach in refusing to vote 100,000 marks for the purchase of works of art, and offering to place the sum at the disposal of Prince Leopold. A member of the Bavarian Diet had already offered to supply the money which the Clerical majority had withheld in retaliation for the dismissal of Minister of Education von Landmann because he had upheld a Catholic professor in a dispute with the Würzburg University senate. The Emperor Wilhelm's impulsive strictures on a constitutional

act of the Legislature of one of the federated states, one most jealous of its parity with Prussia in the federation, seemed to have the more political significance because the political party responsible for the act that provoked his outburst was the one that in the Prussian Chambers had defeated the canal bills and other legislative projects that he had espoused, as was his constitutional right, and also bills in the Reichstag that he claimed to have the right to influence in the same way.

The Prussian Diet in the session that began on Jan. 8, 1902, notwithstanding a deficit due mainly to the diminution of railroad receipts, was invited to authorize the construction of new branch lines. The extension of the canal system was regarded by the Government as a matter of urgent necessity for the whole country. Measures were taken by the Government in advance of parliamentary grants for the relief of agricultural distress in Posen and Westphalia. The situation in the bilingual districts of the eastern part of the kingdom had assumed an aspect so serious that the Government considered it a question of self-preservation for the Prussian state to maintain for the German element the political and economic position to which it can justly lay claim in virtue of the civilizing influence it has long exercised. Unpatriotic agitation would be firmly suppressed in reliance upon the energetic cooperation of the German population in those districts and the support of the whole nation, which regards the repression of the German language and German culture as an assault upon the national honor and dignity. The Polish settlement bill approved by the Landtag provided for an addition of 250,000,000 marks to the fund for land purchase and settlement in West Prussia and Posen, of which sum 150,000,000 marks, supplementing 200,000,000 marks voted for the purpose in former years, are to be devoted to the colonization of small German proprietors in the Polish provinces and 100,000,000 marks to the purchase of estates to be converted into Government domains and forests. The Poles were more thrifty, industrious, intelligent, prosperous, and prolific than the Germans in Poland, and therefore the task of Germanizing these provinces was difficult, if not hopeless. Religious instruction in the German language had recently been introduced in Wreschen, and when Polish children absented themselves they were sent for and whipped. This incident, published throughout the world by the Poles, the Government was ashamed of, and not only was corporal punishment forbidden in such cases, but the attempt to utilize religious instruction as a means of removing the impression that German is the language of Protestants only was abandoned. Anti-Prussian demonstrations in Russian Poland were summarily suppressed by the authorities, and similar demonstrations in Galicia were stopped by the Austrian Government, but Poles of all conditions manifested clearly enough their sympathy for their Prussian compatriots, and their resentment was intensified when Russian and Austrian Poles were expelled from Prussian colleges. Expelled students who returned to Russian territory were arrested by the police. The Russian Government found its policy of Russification rendered more difficult in consequence of the revival of the Polish national spirit in Posen, East and West Prussia, and Silesia. The Roman Catholic clergy in Russian Poland refused to give religious instruction in any language but Polish, and disregarded the decree of the Russian Government that where the children are not of

Polish parentage they shall be taught in Russian. The Roman Catholic Archbishop of Vilna was relieved of his functions for this reason. The Prussian Government in April issued a decree intended to check the immigration of Poles into Prussian territory. Many intending emigrants to the United States were brought across the border by swindling emigration agents and left there without money to take them farther. The decree orders all to be stopped at the frontier who are not provided with a passport and 400 marks in money besides railroad and steamship tickets. Children without their parents are not admitted, nor cripples or invalids. The settlement commission which had charge of the fund for colonizing Poland with German farmers spent 144,000,000 marks of the 200,000,000 marks voted in 1886 and 1898, and of the remainder 39,000,000 marks were required to complete the settlement of the lands they had acquired for German proprietors and tenants, 406,000 acres. The scheme had proved a failure so far. In spite of the Government settlements the total German holdings in Poland had decreased and those of the Poles had increased 77,000 acres since the experiment was started. Some of the assisted settlers had become Polonized, and many had sold out their farms to Poles and quitted the uncongenial surroundings to return to their own country. The Government asserted that German farmers, artisans, and traders were boycotted. In order to prevent the new settlers from parting with their lands for any price they could get so as to escape from Poland, the lands purchased with the new fund will only be leased or sold for an annual rent on terms preventing their transfer without the consent of the Government. Inducements were offered to the proprietors settled on the lands previously purchased to convert their tenure into one of this character. The policy of expropriating Polish proprietors and settling German farmers on the land was initiated by Prince Bismarck. Thus far it had defeated its own object by strengthening the Polish element in the towns and artificially raising the value of land over 20 per cent. The industrial and economic development of Poland, to which in the German part of the ancient kingdom the Prussian Government contributed some capital by its attempt at colonization, was coincident with the disappearance of the political and class divisions among the Poles and of the old Conservative party which clung to aristocratic traditions. A large meeting of Poles in Berlin resolved in favor of the organization of Polish life on a democratic basis, the retention of Polish land in Polish hands, and a Polish education for Polish children. The national spirit of the Poles was inflamed the more by a speech of the Emperor Wilhelm, declaring that Polish arrogance, encroaching on Germanism, had compelled him to summon his people to renew the struggle of the Teutonic knights of old for the preservation of the most precious national possessions. Count von Bülow said that Poles multiplied like rabbits, Germans like hares. The Polish danger that the Government undertook to avert was not confined to the Polish provinces. The Poles migrate as laborers to Westphalia and other mining and industrial parts of Germany, bringing with them everywhere their language, religion, national customs, and a standard of living that enables them to underbid Germans in the labor market. They often marry German or Polish women and bring up large families, forming Polish settlements in the midst of a purely German population. For every German settled with state aid in Poland

scores of Poles have established homes among the Polish communities in the heart of Germany.

A bill passed by the Prussian Landtag for regulating the inspection of meat was the complement of similar legislation in the Reichstag. Although its ostensible purpose was to protect the public health, the object was to shut out American and other foreign meat for the benefit of Prussian growers of live stock. Hence it was supported by the Agrarians and opposed by the Socialists and Radicals, who complained of the dearth of meat already caused by laws and administrative regulations similarly inspired and similarly defended as hygienic measures. The imperial law, which went into force on Oct. 1, 1902, forbids the use of noxious materials in the preparation of meat for transport or sale, the decision as to what is noxious to be left to the Federal Council. The materials declared to be noxious are boric acid and its salts, alkali and alkaline earth, hydro-oxides and carbonates, sulfuric acid and its salts, salicylic acid and its compounds, and chloric-acid salts. The employment of any of these preservatives and the sale or possession of preparations containing them was made unlawful; also the use of any coloring-matter except in margarine and sausage skins. Importers and manufacturers claimed that boric acid is harmless, but they had no opportunity to offer evidence before the promulgation of the law. A bill to prevent the defacement of scenery with advertising boards or notices empowers the police to prohibit outside of towns any advertising device or conspicuous sign that disfigures the landscape. In urban areas the authorities already had power to remove ugly advertisements. The Prussian bill to prohibit the disfigurement of rural spots remarkable for natural beauty, which leaves the police authorities to judge what is a disfigurement, was not passed without opposition, but the merit of the measure on the ground of public policy was recognized, and proposals to grant compensation or exempt certain kinds of advertising signs were rejected. In Hesse and other states similar statutes were enacted to protect natural scenery and public monuments.

Maritime Conference.—The International Maritime Committee, whose object is to harmonize the views of national associations that are studying improvements in maritime law, held its fourth annual meeting at Hamburg in the summer of 1902 in succession to the conferences at Antwerp, London, and Paris. A treaty proposed at Paris in 1900 would change the old rule by which damages from collisions are borne in equal shares where the accident is inevitable and without fault or where the fault is inscrutable. In such cases the committee proposes that the losses should lie as they fall. Where both ships are in fault the English law makes each bear half the loss, receiving from the other a contribution of half her own loss and contributing half the loss sustained by the other. Continental maritime law generally discriminates as nearly as possible between the degrees of fault and apportions the damages accordingly. The committee approves this rule. The treaty it has drawn up furthermore removes all restrictions on the measure of damages, allowing compensation for detention during repairs and the whole actual detriment and loss of profit that can be proved to have resulted from the accident. The fact that the collision is caused by the fault of a pilot whose employment is compulsory or by fault of a tug shall not be a defense. Neglect of the duty to afford assistance to the injured ship shall not entail

a presumption of fault from the point of view of the pecuniary responsibility for the accident. These provisions are also in accordance with Continental laws and contrary to existing British rules. The French distinction between salvage of a derelict and assistance of a crippled ship is abolished in the proposed treaty, with all rules fixing an arbitrary proportion of value due to the salvor, such as 33 1/3 per cent. of the value of an abandoned vessel which the French code allows. The limitation of ship owners' liability was referred to a new commission. On the motion of Everitt P. Wheeler, representing the United States, the proposal that damage and expense sustained by the salvor should as of right be made good in case of successful salvage or assistance was stricken from the draft treaty. It was agreed that tribunals of either the home port of the defendant vessel or of the personal domicile of the defendant party should have jurisdiction in cases of collision; in case of a collision in territorial waters the representatives of Austria, Hungary, Japan, Sweden and Norway, and two other nations voted to give jurisdiction to the courts of the country where it takes place, although the vessel may not be arrested there nor either plaintiff or defendant have his domicile there; 5 countries, including England, France, Germany, and the United States, voted in the negative, and the question was reserved for further discussion at a future conference. That registration should give jurisdiction to the courts of the port of where a ship is registered was agreed to by a vote of 9 nations against 4. The question whether the courts of a place where the defendant ship can be seized could have final jurisdiction was decided affirmatively, but the United States representatives were alone in supporting the present American and English practice, which confers jurisdiction on the courts of a country in which a defendant can be served, although he has neither domicile nor residence there. Whether mere residence should suffice was left for further consideration.

Labor Congresses.—The thirteenth International Congress of Miners met at Düsseldorf on May 19, 1902. For the first time the British miners represented were less numerous than those of the Continental countries. From the Continent there were 72 delegates voting for 748,000 miners. From Great Britain 39 delegates represented 625,000 members of the British Miners' Federation and 3 represented 80,000 miners of Durham, who still held out against the legal eight-hour day demanded by all other miners, British as well as Continental. The objects of the congresses were defined to be to limit the hours of underground labor from bank to bank; to obtain proper supervision and inspection of mines, including the election of additional inspectors by the workers, such inspectors to be paid by the state; to organize powers to enforce legal enactments; and to devise means to secure just contracts and fair treatment for all persons in or about mines. The Welsh miners desired an eight-hour day, among other reasons, because it would allow shot-firing to take place between shifts after an interval sufficient to allow dust to settle after the men had left the mines. German delegates declared that accidents most frequently occurred in Germany when the men were exhausted by long hours of labor. A French delegate described the bill passed by the French Chamber gradually reducing the work-day to eight hours from bank to bank. A Belgian delegate testified that in his country the few legal enactments that existed for the purpose of pre-

venting accidents were not strictly applied. An Austrian delegate was interrupted by a Welsh delegate, who thought that if the rule previously in force allowing but a single German speech to German and Austrian delegates together were to be disregarded the Welsh and English might speak for the miners of their separate nationalities. The rule, which was made because in former congresses the German and Austrian representation combined was comparatively small, was rescinded on the motion of an English delegate. The Austrian then described the new Austrian law which reduces the hours of labor in coal-mines to nine hours a day. The congress voted in favor of a legal eight-hour day, which on the motion of the French delegation applies also to surface workers. In regard to compensation for accidents and old-age pensions, it appeared that miners are worst off in Belgium, where there is no law on the subject and the benefit associations pay only a quarter of the wages in cases of accident and an old-age pension of a quarter of a franc a day. In England the doctors frequently deprive the victim of an accident of the full amount of his insurance on the ground of complication with diseases. German doctors cut down allowances in the same way, and the law has intervened to forbid the payment of insurance equal to the daily rate of wages when the man has paid subscriptions to benefit societies to secure that amount of insurance or more. The German law of compulsory insurance allows two-thirds of earning capacity lost as the result of an accident. In Austria the miners have only their benefit funds to rely upon, and these are in an insolvent condition. When incapacitated by accidents they receive from 30 kreuzers to a gulden a day until they recover, and if totally incapacitated a pension varying from 80 to 120 guldens a year, for which benefits they have to subscribe from 2 to 5 per cent. of their wages. The French miners are the most favorably treated in case of accidents, since they contribute nothing to the fund, yet after the fourth day receive half-wages. The congress voted unanimously to have compensation laws amended so as to cover all accidents in or about mines, to begin from the day of the injury. It was unanimously agreed that miners should endeavor to obtain a minimum rate of wages. The congress considered that the governments of all countries should provide pensions for the aged and those unfit for work. Sympathy was extended to the French miners in their effort to secure pensions of 2 francs a day after twenty-five years of service, irrespective of age. A resolution that miners in general elections should vote only for candidates pledged to support the proposals adopted by the International Congress and endeavor to enact them into laws; in default of such candidates the miners should nominate and elect representatives from among themselves. The congress adjourned on May 23.

An International Trade-Union Congress was held at Stuttgart in June. The English delegates agreed with their Continental colleagues in the opinion that, in addition to endeavoring to obtain better wages, it was necessary to direct their attention to politics, and that the amalgamation of the trade-unions with international socialism was only a question of time, although the old-fashioned unions were not yet ready to adopt the socialist theories.

The thirteenth German Socialist Congress was opened at Munich on Sept. 15. The Bernstein proposals for the revision of the Marxist dogmas on which Social-Democratic programs have been based and the adoption of more practical political

aims were once more advanced by their author. The trade-unionists in the congress differed with the advanced Socialists in regard to workmen's insurance and other labor legislation. The unions, which had their benefit associations before compulsory insurance was introduced, held the opinion that Government should aid workmen by subsidizing their own organizations, and that if unorganized workmen could obtain from the Government the same advantages as those who belonged to labor organizations could achieve, the interests of unionism would suffer. Both parties agreed that existing legislation is inadequate. The congress adopted resolutions demanding the extension of insurance to all workmen, its unification, the control of its administration by the insured, and the contribution to its costs by all classes; the extension of the existing system of accident insurance, the establishment of a board of control composed of officials elected by the workmen and paid by the Government; the improvement of the means of preventing diseases incident to labor, full compensation to families of injured workmen, and the prohibition of the employment of women for four weeks before and after childbirth; and the establishment of insurance for the unemployed and for the widows and orphans of workmen. The Reichstag delegates of the party were instructed to consider the advisability of moving a resolution in the Reichstag in favor of an eight-hour day. The congress resolved to support only candidates for the Reichstag pledged to uphold universal suffrage, to vote against higher import duties on foodstuffs, or any indirect tax on articles destined for the people's consumption, and to oppose any military or naval bill increasing the burdens of the people. The exclusion of foreign meat was condemned. A resolution was passed recognizing the danger to working men from immoderate indulgence in alcohol, but declining to make total abstinence a condition of party membership.

Dependencies.—The possessions and protectorates of Germany over the seas, all acquired since 1884, have a total area estimated at 1,027,820 square miles, of which 931,460 miles are in Africa (see EAST AFRICA, SOUTH AFRICA, and WEST AFRICA), 200 square miles in Asia, and 96,160 square miles in the Pacific. The Asiatic territory consists of the town, harbor, and district of *Kiauchau*, occupied by a naval force in November, 1897, and on March 6, 1898, leased to Germany by the Chinese Government for the term of ninety-nine years. A protectorate was proclaimed on April 27, 1898. The leased territory has an area of 200 square miles, not including the bay, which is of equal extent. Surrounding the German territory, which has 60,000 inhabitants, is a neutral zone having an area of 2,500 square miles and a population of about 1,200,000. The administration of *Kiauchau* is under the control of the naval authorities, and at its head is a naval officer, Capt. Truppel in 1902. The estimate of expenditure for 1903 is 12,528,000 marks, of which only 360,000 marks are raised by local taxation, 12,168,000 marks being supplied from the imperial treasury. The garrison in 1902 consisted of 2,352 marine infantry and artillery. A harbor is being dredged out and a mole built, 2 miles in length. From Tsin-tau, opposite *Kiauchau*, the Germans are building a railroad into Shantung to Tsinan, which will thence run south to Yenchau, and there meet another railroad to be built in a southwesterly direction from *Kiauchau*. The railroad will tap the coal-fields of Weihsien and

Pashan, within 100 miles of *Kiauchau*, of which Germans by the treaty have the concession, as well as priority in all other concessions to be granted in Shantung. The railroad was completed to Weihsien in the spring of 1902.

In the Pacific Germany possesses Kaiser Wilhelm Island and the Bismarck Archipelago, proclaimed German protectorates in 1884; the Marshall Islands, occupied in 1885; the Caroline, Palao, and Marianne Islands, purchased from Spain for 16,750,000 marks and transferred on Oct. 1, 1899; part of the Solomon Islands, Choiseul, Isabel, and various smaller islands having been ceded to Great Britain by the convention of Nov. 14, 1899; and the largest islands of the Samoan group, the triple protectorate over the whole group having been renounced by Great Britain in the Anglo-German agreement of Nov. 14, 1899, and by the United States, which received Tutuila. *Kaiser Wilhelm Island* is the northern part of the southeastern half of New Guinea. The protectorate, which includes Long Island, Dampier Island, and other islands, has an area estimated at 70,000 square miles and about 110,000 inhabitants. The number of Europeans on Jan. 1, 1899, was 58, of whom 53 were Germans. The German New Guinea Company, which formerly conducted the administration, transferred it to the Imperial Government on April 1, 1899. The local revenue for 1903 was estimated at 100,000 marks, which was supplemented by an imperial subvention of 722,000 marks. The natural products include sago, areca-nuts, ebony, bamboo, and coconuts. The coco-palms are carefully preserved. Tobacco, cotton, and coffee are cultivated. Copra, mother-of-pearl, and trepang are bartered by the natives for European goods. Gold is found in the Bismarck mountains. The value of imports in 1900 was 377,682 marks, of which 109,624 marks represent food substances. The value of exports was 212,117 marks, of which 119,360 marks represent tobacco and 65,000 marks copra. Dr. Hahl was in May, 1902, appointed Imperial Governor of the South Sea possessions of Germany constituting the Micronesian protectorate.

Bismarck Archipelago comprises Neu Pommern, Neu Mecklenburg, and Neu Lauenburg, formerly called New Britain, New Ireland, and the Duke of York Islands; also New Hanover, and the Admiralty, Anchorite, Hermit, Commerson, and other islands. The total area is estimated at 20,000 square miles and the population at 188,000. There were 200 Europeans in 1899, of whom 96 were Germans and 34 British. There were 64 Chinese and 68 Samoans and Fijians. The value of imports in 1900 was 1,240,925 marks, of which 243,769 marks represent articles of food. Exports were valued at 907,282 marks, of which 651,141 marks represent copra and 110,634 marks trepang. The islands were visited in 1899 by 132 vessels, of 37,448 tons.

The part of the *Solomon Islands* belonging to Germany includes Bougainville and Buka. The products are sandalwood and tortoise-shell.

The *Marshall Islands* consist of two chains of coral islands known as Ralick and Ratak. The area is about 150,000 square miles and the population 15,000, including 55 Europeans, of whom 48 are Germans. Coconut-palm trees have been planted. The value of imports in 1900 was 454,300 marks; of exports, mainly copra, 509,000 marks.

The *Caroline, Palao, and Marianne Islands* were first attached to the New Guinea protectorate. The Caroline and Palao Islands, having an area of 560 square miles, with 40,000 inhabit-

ants, are divided for purposes of administration into the Eastern Carolines and the Western Carolines and Palaos. The local revenue for 1903 was estimated at 33,100 marks and the expenditure at 338,100 marks, the Imperial Government contributing 305,000 marks. Copra is exported, and from the Palaos tortoise-shell and mother-of-pearl also.

The total revenue of all the German protectorates for 1902 was estimated at 8,440,900 marks, and the expenditures at 39,076,500 marks, leaving a deficit of 30,635,600 marks to be covered by imperial grants. The total recurring expenditure is 24,152,800 marks; non-recurring expenditure, 14,756,400 marks; reserve fund for emergencies, 167,340 marks. The increase in revenues over 1901 is 1,318,000 marks; increase in expenditure, 2,472,900 marks; increase in imperial grants, 1,154,900 marks.

GIFTS AND BEQUESTS. The following list comprises the most notable gifts and bequests for public purposes, of \$5,000 and upward in amount and value, that were made, became operative, or were completed in the United States in 1902. It excludes the ordinary denominational contributions for education and benevolent purposes, all State and municipal appropriations to public and sectarian institutions, and the grants of Congress for various measures of relief. As in the previous year, large individual philanthropy was a striking feature of the gifts and bequests. Besides the instances noted, there were several of exceptional amounts that are excluded from the list because they were propositions yet to be fulfilled or were still in an indefinite shape. Among these, which deserve notice as parts of the benevolent record of the year, are the following:

John D. Rockefeller proposed to endow a corporation, known as the General Education Board and created by an act of Congress in 1902, with a sum understood to be \$10,000,000. The object of the corporation, as set forth in the act, is "the promotion of education within the United States of America, without distinction of race, sex, or creed," and the corporation is authorized "to establish, maintain, or endow, or aid others to establish, maintain, or endow, elementary or primary schools, industrial schools, technical schools, normal schools, training-schools for teachers, or schools of any grade, or higher institutions of learning; to employ or aid others to employ teachers and lecturers; to aid, cooperate with or endow associations or other corporations engaged in educational work within the United States of America." The corporators' names in the bill are William H. Baldwin, Jr., Jabez L. M. Curry, Frederick T. Gates, Daniel C. Gilman, Morris K. Jesup, Robert C. Ogden, Walter H. Page, George Foster Peabody, and Albert Shaw.

President William R. Harper, of the University of Chicago, on Nov. 19 confirmed a report that \$8,000,000 had been secured for the consolidation of Rush Medical College with the university, but declined to make public the name of the donor.

Henry C. Frick, of Pittsburg, was credited with the intention of founding a university in that city which would be a larger institution than the Polytechnic School for which Andrew Carnegie had set aside \$5,000,000. Mr. Frick's plan comprised the furnishing of ground, buildings, and an endowment of \$2,500,000.

J. Ogden Armour, of Chicago, on whose young daughter Prof. Adolf Lorenz, of Vienna, had performed an operation, was preparing plans at the close of the year for the establishment in Chicago of a Lolita Armour Institute of Bloodless Surgery, providing ground, buildings, and an en-

dowment of \$3,000,000, the institution to be under the charge of Dr. Frederick Mueller, Prof. Lorenz's assistant.

Toward the close of the year Mrs. Jane Lathrop Stanford, of San Francisco, ordered the preparation of plans for a new library building for Leland Stanford Junior University, to be "the handsomest and most costly structure of its kind on this continent."

Excluded also from the list are the contributions from various sources for the American Board of Commissioners for Foreign Missions, aggregating \$18,369,163; and also the contributions of the year to the Methodist Episcopal Thank-offering Fund for the promotion of education, which in the specified three years ending Dec. 31, 1902, overlapped the \$20,000,000 asked for by more than \$1,000,000.

The known value of the gifts and bequests here enumerated exceeds \$94,000,000.

Abraham, Abraham, Brooklyn, N. Y., gift to Cornell University, the great Egyptological and Assyriological library of the late Prof. August Eisenlohr, of Heidelberg University.

Adams, Charles Kendall, Madison, Wis., bequest to Wisconsin University, available on the death of his widow, which occurred also in 1902, 15 fellowships of \$10,000 each. See OBITUARIES, AMERICAN.

Adams, Prof. Herbert Baxter, Johns Hopkins University (died in 1902), bequest to the university, his residuary estate; paid in 1902, amounting to \$43,000.

Adelphi College, Brooklyn, N. Y., gift from friends to secure gift of \$125,000 from John D. Rockefeller, \$125,000.

Albinger, Joseph, Mount Vernon, N. Y., bequest to the Church of Our Lady of Victory there, \$25,000.

Allegheny College, gift from friend, for endowment fund, \$300,000.

American Unitarian Association, New York, gift from a friend, for missionary work, \$10,000.

Ames, Mrs. Anna C., North Easton, Mass., gift to the public high school there, a fully equipped gymnasium, cost \$10,000.

Minded Children, Children's Seashore Home at Atlantic City, Hampton Normal and Agricultural Institute, American Colonization Society, Pennsylvania Society to Protect Children from Cruelty, Pennsylvania Society for Prevention of Cruelty to Animals, Indian School in Carlisle, Pa., and Bernardo Homes in London, Eng., each \$5,000; the Tuskegee Normal and Industrial Institute, \$2,000; and to several other institutions amounts making an aggregate of \$500,000.

Berden, Jacob C., Hackensack, N. J., bequest to the Hackensack Hospital, the bulk of his estate, valued at \$75,000.

Berry, George R., Baltimore, bequest to the Woman's College, Baltimore, available by decision of the court, between \$15,000 and \$20,000.

Beth-Israel Hospital Association, New York city, gifts for the erection and equipment of a hospital building; cost, \$225,000; opened May 25, 1902.

Billings, Robert C., Boston (died in 1899), bequests to his executors, to be distributed by them among such charitable institutions as they might select, the residue of his estate. On Dec. 12, 1902, the executors presented to the Supreme Court of Massachusetts a statement setting forth that they had a fund of \$1,000,000 for distribution, and presenting a list of 126 selected educational and charitable institutions for the approval of the court. Included in the list are nearly all the well-known Boston charities, libraries, and museums, several churches and hospitals, hospitals in a score of other New England cities, and the following-named institutions: St. Andrew's congregation (New Orleans), Bates College, Berea College, Wellesley College, Tuskegee Institute, Lincoln University (Cumberland, Tenn.), Fisk University, Atlanta University, Fairmount College (Wichita, Kan.), Mayesville (South Carolina) Institute, Meadville Theological Seminary, Phillips Exeter Academy, Hackley School (Tarrytown, N. Y.), Abbot Academy, Andover. The direct bequests in his will included the following: \$100,000 to Harvard University; \$100,000 to the Massachusetts Institute of Technology; and \$50,000 to the Institute of Technology to found a "Billings Student fund." Any student receiving benefit is expected to abstain from the use of alcohol and tobacco. The direct bequests and residuary distribution aggregated \$1,845,000.

Bishop, Heber B., New York, gifts to the Metropolitan Museum of Art, a collection of jade ornaments valued at \$750,000, and to fit up a room for its exhibition, \$55,000.

Bissell, William C., Lincoln, Neb. (died in 1898), bequest to the National Christian Association of Chicago, to aid its crusade against secret societies, nearly all his estate of \$25,000. The will was contested, and was upheld by the court in 1902.

Bliss, Aaron T., Governor of Michigan, gift to Albion (Mich.) College, \$21,000.

Blocker, John, Buffalo, N. Y., gift to trustees, the Mineral Springs farm of 118 acres, near that city, as a site for a group of charities to be known as the Blocker Homes, together with a pledge of \$100,000 in cash and \$100,000 more by his will.

Blumenthal, Isaac, New York, bequests to Mount Sinai Hospital to establish a perpetual bed, \$2,500; Hebrew Benevolent and Orphan Asylum, \$1,500; Montefiore Home, \$1,000; and Home for Aged and Infirm Hebrews, \$500.

Boardman, Lucy C., New Haven, Conn., gifts to that city, a Manual Training-School, cost \$150,000; and to Yale University, funds for a science laboratory, to cost \$60,000.

Boston (Mass.) University, gifts to endowment, from the Board of Trustees, \$50,000; from outside friends, \$150,000.

Rust, Mrs. Nancy E., Boston, bequests to Addison Gilbert Hospital, Gloucester, Mass., unconditionally, \$10,000, and the reversion of \$15,000; Children's Hospital, Perkins Institute for the Blind, and Kindergarten for the Blind, all in Boston, each the reversion of \$5,000; and 15 other institutions, an aggregate of \$25,000.

Russian Residents, New York city, gifts for the erection of the Russian Orthodox Church of St. Nicholas there (dedicated Nov. 23, 1902), aggregating about \$100,000.

Ryan, Thomas F., New York, gift to the Roman Catholic diocese of Richmond, Va., for the erection of the Cathedral of the Sacred Heart, \$250,000.

Ryerson, Martin A., Chicago, Ill., gift to the city of Grand Rapids, Mich., for a library, \$20,000.

Byle, Mrs. Mary E., Paterson, N. J., gift to the city, to replace the Paterson Library, originally built by her and destroyed in the great fire of Feb. 15, 1902, \$100,000.

Sage, William H., Albany, N. Y., gift to Cornell University, of a stone pulpit for Sage Chapel.

St. Paul's Methodist Episcopal Church, New York, gifts from friends, toward paying the church debt, \$25,000.

Sather, Mrs. Jane K., San Francisco, gift to the University of California, a gateway and bridge, cost \$10,000.

Sayles, Frederick C., Pawtucket, R. I., gift to the city, the Deborah Cook Sayles Memorial Free Library.

Schiff, Jacob H., New York, gifts to the Jewish Theological Seminary, New York, a site and building for the new seminary; New York Public Library, for the Semitic department, \$20,000; Hebrew Sheltering Guardian Society, \$10,000; and Cooper Union, for scholarships, \$5,000.

Schwab, Charles M., New York and Pittsburgh, President of the United States Steel Corporation, gifts for the erection of a church for St. Thomas's Roman Catholic congregation at Brad-dock, Pa., \$70,000; to Pennsylvania State College, \$65,000; and to Mount Aloysius Academy, Cresson, Pa., an alumni and assembly hall, cost \$25,000.

Scott, Charles, Sr. and Jr., Philadelphia, Pa., joint gift to Wesleyan University, for a physical laboratory, \$75,000.

Scribner, Mrs. John Blair, New York, gift to the Second Presbyterian Church of Saratoga, a parsonage, cost \$10,000.

Seligman, Jefferson, New York, gift to Mount Sinai Hospital, an electrical ambulance.

Severance, L. H., Cleveland, Ohio, gift to the University of Wooster (Ohio), for a new building fund, \$75,000.

Shanley, John F., Newark, N. J., gift to the building fund of the Cathedral of the Sacred Heart there, \$5,000.

Shaw, Alexander, Baltimore, bequests to the Woman's College of Baltimore, \$50,000; and to Pennington Seminary, \$10,000.

Sheffield Scientific School, gift from a friend, a new laboratory of mineralogy, named Kirtland Hall, cost \$150,000.

Sheldon, Henry King, Brooklyn, N. Y., bequests to Silver Lake Presbyterian Church, \$15,000; Brooklyn Philharmonic Society, and Brooklyn Institute, for concerts, each \$10,000; and Brooklyn Institute, unconditionally, \$2,500.

Sherman, Mrs. Hannah N. L., Lawrence, L. I., gift to New York Post-Graduate Hospital and College, for a ward for nervous diseases, \$25,000.

Siegel, Henry, New York, gift to Stony Wold Sanitarium, for a dormitory, \$20,000.

Silliman, H. B., Cohoes, N. Y., gift to Mount Hermon School, Northfield Mass., for improving Silliman Science Hall, \$10,000.

Simon, Mrs. Clara, New York, gift to Lebanon Hospital, \$60,000.

Simons, James D., Jersey City, N. J., gift to Grace Church of that city, \$5,000.

Small, Mrs. William, Leavenworth, Kan., gift for an Old Ladies' Rest in that city, \$50,000.

Smith, George, St. Louis, Mo., bequest to Harvard University, for 3 new dormitories, \$450,000.

Smith, James Henry, New York, gift to the Metropolitan Museum of Art, Rubens's Holy Family, valued at \$50,000.

Smith, James, Newark, N. J., gift to the Cathedral of the Sacred Heart now building there, \$25,000.

South Orange (N. J.) Methodist Episcopal Church, gifts from friends, a total of \$12,000.

Sower, Charles G., Philadelphia, Pa., bequest to charitable institutions, \$30,000.

Spence, W. W., Baltimore, Md., gift to Johns Hopkins University, toward endowment fund, \$50,000.

Spreckels, Claus, San Francisco, gift to the University of California, for special books, \$11,875.

Spreckels, Rudolph, San Francisco, gift to the University of California, for a physiology hall, \$25,000.

Steele, Mrs. Esther Baker, Syracuse, N. Y., gift to Syracuse University, \$10,000.

Stetson, Francis Lynde, New York, gift to Williams College, \$50,000.

Stillman, James, New York, gift to Harvard University, to found a Chair of Anatomy, \$100,000.

Stratton, Winfield Scott, Colorado Springs, Col., bequest for a Home for the Poor, the bulk of his estate, valued at \$14,000,000.

Stuart, William A., Brooklyn, N. Y., bequest for a Masonic building in that borough, \$125,000.

Studebaker, Clem, family of the late, South Bend, Ind., gift to the Epworth Hospital there, to pay for a new building, \$75,000.

Swift, Gustavus F., Chicago, gift to debt-raising fund of local Methodist Episcopal churches, \$10,000.

Swope, Thomas H., Kansas City, Mo., gift to Central University, Danville, Ky., \$25,000.

Teachers College, New York, gift from a friend, for a new gymnasium, \$250,000.

Temple Emanuel, Congregation of, New York, gift to Columbia University, for endowment of a fellowship in honor of the Rev. Dr. Gustav Gottheil, \$15,000.

Thomas, George C., Philadelphia, gift for building for parish work in connection with the projected Protestant cathedral in Manila, \$25,000.

Thompson, Mrs. Mary, New York, gifts to Williams College, a chapel; and to Vassar College, a library building.

Thompson, Mrs. Mary Shaw. See PRATT, Mrs. MARY MORRIS.

Tompkins, Mrs. Cornelia C., New York, bequests to Tuskegee (Ala.) Normal School, \$20,000; Children's Aid Society, \$10,000; and Woman's National Sabbath Alliance, Woman's Executive Committee of Home Missions of the Presbyterian Church, and American Seaman's Friend Society, each \$5,000.

Tousley, Orsen V., Washington, bequest to Williams College, available on the death of his widow, his estate, estimated at \$70,000.

Tower, Charlemagne, gift to the Philadelphia Library, 2,500 Russian books.

Tuck, Edward, an American citizen resident in Paris, France, gift for the benefit of the American colony in Paris and American visitors to that city, the Franklin Hospital, erected on the most approved American models and managed by American physicians and nurses.

Tully, Miss Cecilia, Boston, Mass., bequests to Woodstock College, \$30,000; St. John's Seminary, \$10,000; Apostolic College, County Limerick, Ireland, \$5,000; Boston College, for scholarships, \$4,000; Working Boys' Home, \$2,000; Religious Society of the Sisters of Mount Carmel, and the Oblate Fathers Novitiate at Dublin, each \$1,000; and Little Sisters of the Poor, Home for Destitute Catholic Children, House of the Good Shepherd, and Carney Hospital, each \$500.

Turkey, Sultan of, gift to the University of Pennsylvania, through Prof. Herman V. Hilprecht, a collection of Babylonian antiquities, said to be the richest in the world.

Tuskegee (Ala.) Institute, gift from a friend, for a girls' dormitory, \$25,000.

University of California, gift from friends, \$30,000; the Alumni Association, \$9,000; and a friend for salary of the professor of physiology for three years, \$15,000.

Upson, Dr. Anson Judd, Utica, N. Y., bequest to the public library, \$5,000.

Vanderbilt, Mrs. Cornelius, New York, gift to St. Bartholomew's Church, an entire new front, cost \$200,000.

Vanderbilt, Frederick W., New York, gift to Sheffield Scientific School of Yale University, for a new dormitory, land and money, value about \$500,000.

Van Besselaer, Mrs. Mary Thorn, New York city, bequest to her husband and sister, the interest to be used in aiding the poor and sick, \$25,000.

Vassar College, Poughkeepsie, N. Y., gifts from friends, a library building and a chapel; from Alumnae Endowment Committee, \$9,000; for the Abbot and Beach Scholarships, each \$8,000; and for a scholarship founded by the Association of Students of Miss Hersey's School, Boston, Mass., \$5,000.

Vickery, Percy O., Augusta, Me., bequest to the Winthrop Street Universalist Church, \$10,000.

Von Pape, Ernest, New York, bequest to the German Hospital, \$5,000.

Voorhees, Ralph, Clinton, N. J., gifts to Rutgers College, \$50,000; Coe College, Cedar Rapids, Iowa, \$25,000; and Carroll College, Waukesha, Wis., \$20,000.

Wade, J. H., Cleveland, Ohio., gifts to Cleveland Fresh Air Camp and Lakeside Hospital, each \$100,000; Cleveland Day Nursery and Kindergarten Association, \$50,000; and Salvation Army, \$1,000.

Wales, Mrs. Maria W., Boston, Mass., bequests to the Boston Museum of Fine Arts, \$20,000; Harvard College and the Kindergarten of the Blind, each \$10,000; Home for Aged Colored Women and the Children's Hospital, each \$1,000; and the Tuckerman Circle, \$100.

Walker, Mrs. Mary G., Brooklyn, N. Y., bequests to New York Association for Improving the Condition of the Poor, and St. Luke's Hospital, each \$100,000; New York Association for Improving the Condition of the Poor, for the Fresh Air Fund, and Society of St. Johnland, each \$50,000; Home for Incurables, Fordham, and Children's Aid Society, Orphans' Home and Asylum of the Protestant Episcopal Church, Colored Home and Hospital, Home for Old Men and Aged Couples, New York Institute for the Blind, and St. Luke's Home for Indigent Christian Females, all of New

York city, each \$25,000; New York Society for Relief of the Ruptured and Crippled, \$15,000; and Samaritan Home for the Aged, \$10,000.

Walsh, Mrs. Ann Eliza, Brooklyn, N. Y., gift to Henry McCaddin, Jr., fund for education of candidates for the Catholic priesthood, \$450,000.

Wanamaker, John, Philadelphia, Pa., gift to Bethany College, Philadelphia, Pa., a new building, cost \$300,000.

Warburg, Felix M., New York city, gift to new building fund of the Hebrew Technical School for Girls, \$5,000.

Waters, Mrs. Sarah Ann, New York city, bequests to the American Female Guardian Society and Home for the Friendless, improved real estate valued at \$15,000, and to the Women's Auxiliary of the Guild for Crippled Children of the Poor, \$1,000.

Webb, Mrs. Henrietta A., widow of William H. Webb, founder of Webb Academy and Home for Shipbuilders, New York, bequests to the academy, about \$1,000,000; Hospital for Ruptured and Crippled, and Daisy Fields Home for Crippled Children, at Edgewater, N. J., each \$1,000; and Night Refuge, Children's Aid Society, and Little Mothers of New York, each \$500.

Webb, William Seward, M. D., New York city, gift to the University of Vermont, for purchase of the herbarium of Cyrus G. Pringle, \$6,000.

Webber, Mrs. A. S., Nashville, Tenn., gift for a polytechnic institute there, \$150,000.

Weeks, Mrs. Augusta J. S., Patchogue, L. I., bequest to that village, ground for a public park.

Weeks, George W., Clinton, Mass., bequests to Clinton Hospital, \$30,000; the First Unitarian Church of Clinton, \$22,000; the city of Clinton, for the site of a Carnegie Library, \$15,000, for shade trees, \$3,000, and to provide a course of lectures, \$10,000; the Carnegie Library fund for the purchase of scientific books, \$10,000 (the interest only to be used), and for books and pictures for the Children's Room, \$3,000; and Woodland Cemetery, \$10,000.

Well, Theodore G., New York, bequests to Mount Sinai Hospital, \$2,000; Five Points House of Industry, St. Francis Hospital, Children's Aid Society, and Aguilar Free Library, each \$1,000; St. John's Guild Floating Hospital, Hebrew Orphan Asylum, Montefiore Home for Incurables, Home of the Good Shepherd, Emanuel Sisterhood Day Nursery, Home for Indigent Commercial Travelers, and Skin and Cancer Hospital, each \$500; Society for Prevention of Cruelty to Children, and Society for Prevention of Cruelty to Animals, each \$250; and Actors' Fund, \$200.

Weinstock, H., San Francisco, gift to the University of California, for its College of Commerce, \$5,000.

Wellesley College, gift from Classical Society of, a society house in the style of a Roman villa.

Wells College, Aurora, N. Y., gifts from 8 of the Alumnae, for a recreation hall in honor of Dean Helen Fairchild Smith, \$15,000; from the class of 1902, a memorial window, and other gifts, aggregating \$2,000.

Wells, Daniel, Chicago, Ill., bequests to 6 local charities, each \$1,000.

Wertheim, Henry P., New York, gift to the University Settlement, a new building.

Wesleyan University, gift from the brother of Prof. Van Vleck, an observatory, cost \$50,000; and from a friend, name withheld, for a new science building, \$75,000.

Wharton, Joseph, Philadelphia, Pa., gift to Wharton School of Finance and Economy of the

University of Pennsylvania, an increase of his endowment, \$300,000, making it \$500,000.

Whayne, Robert C., Louisville, Ky., bequests to local charities, \$40,000.

Wheelock, Jerome, Worcester, Mass., bequests to the town of Grafton, Mass., for a town hall, \$100,000; the city of Worcester for a bronze statue of himself, \$100,000; Harvard University and Clark University, each \$100,000; and to local charities, \$50,000.

Whipple, Mrs. Evangeline M., Faribault, Minn., gift to the Episcopal Cathedral of Our Merciful Saviour, as a memorial to Bishop Henry B. Whipple, a set of chimes, cost \$10,000.

White, Francis T., New York, gift to Earlham College, Richmond, Ind., conditional on the raising of \$20,000 more to free the college from debt, \$25,000.

White, Henry, gift to Johns Hopkins University, toward endowment fund, \$5,000.

Widener, Peter A. B., Philadelphia, Pa., gift for building, equipment, and endowment of Widener Memorial Training School for Crippled Children, \$2,000,000.

Wilbur, Warren A., Fountain Hill, Pa., gift to Lehigh University, toward equipment of its mechanical laboratory, \$5,000.

Willis Avenue Methodist Church, Bronx borough, New York, gifts from friends to extinguish debt, \$43,000.

Winthrop, Mrs. Mary J., New York city, bequest to Princeton (N. J.) Theological Seminary, her entire residuary estate, estimated at \$1,500,000.

Woman's Christian Temperance Union, Passaic, N. J., gifts from friends for a hall, \$15,000.

Woman's College, Baltimore, gift from trustees of the great Methodist thank-offering fund, all the contributions paid in the limits of the Baltimore Conference, exceeding \$44,000.

Wood, H. Holton, and wife, Boston, gift to the city of Derby, Conn., a public library, cost \$50,000.

Woodward, Col. Robert B., Brooklyn, N. Y., gift to Brooklyn Institute, for 2 funds, each \$25,000.

Wooster (Ohio) University of, gifts from friends toward rebuilding the university, \$400,000.

Wright, J. Hood, Memorial Hospital, New York city, gift from friends, \$16,929.25.

Wyman, William, Baltimore, Md., and others, joint gift to Johns Hopkins University, for a new site for the university, 175 acres in the northern suburbs of Baltimore, valued at \$1,000,000.

Yale University, gift from the class of 1876, to establish an Arthur Twining Hadley scholarship, \$5,000.

Young Men's Christian Association, Brooklyn, N. Y., gift from friends, for a new building, \$150,000.

Young Men's Christian Association, Douglas island, Alaska, gift from three mining companies there, a furnished building, cost \$6,000; opened on Christmas.

Zabriskie, N. Lansing, gift to Wells College, for equipment of building given by Henry A. Morgan, \$25,000.

Ziegler, William, New York, gift to Barnard College, \$10,000.

GRANGE, NATIONAL. Numerically the Grange reached its highest point about 1875, when it had a paid-up membership of 750,000. Immediately after this a serious decline set in, and by 1888 the membership had been reduced to 100,000. Moreover, by the date last named the Grange

had almost ceased to exist in the South and in the Middle West. Iowa, Missouri, and Indiana, each of which had about 2,000 granges in 1875, had only a few score in 1888. Other organizations came upon the field and took the public eye. These things gave an impression that the Grange was extinct. But its membership never has gone much below the hundred-thousand mark; it never has missed an annual meeting; there has always been a reserve fund in the treasury; and since 1888 there has been a steady, and even a remarkable growth. The present membership is at least 250,000. During the last fiscal year about 16,000 members have been added, and about 350 new subordinate granges organized. In Michigan the order has increased since 1894 from 220 granges, with about 8,000 members, to 550 granges, with 32,000 members. At present New York is the largest grange State, with about 60,000 members; Maine has about 35,000, and New Hampshire ranks fourth with about 26,000. The Grange is still strongest in New England, where it has about 100,000 members; and, considering agricultural resources and population, it is weakest in the Middle West.

The Grange was originally intended to minister to the social and educational needs of the farming class. Its founders never planned that it should be a business agency or a political party. But the so-called "Granger movement"—which ought not to be confounded with the real Grange movement—in the '70s swept the Grange off its feet. Or perhaps it would be more correct to say that the intensity of feeling on the part of the farmers toward the railroads and the middlemen caused the financial and legislative purposes of the Grange to be vastly overemphasized. And the decline of the Grange was largely because of disappointment that it did not yield as prompt returns along these lines as many of its members had looked for. In New England, however, this "Granger movement" did not take place. There the Grange grew more slowly, but it grew on its merits. Its social and educational purposes were constantly emphasized, and it gradually took its place as a recognized social institution. The same kind of growth has more recently taken place in New York, Pennsylvania, Ohio, and Michigan.

The social work of the Grange is maintained through its frequent meetings, through socials, picnics, etc. The subordinate or local grange meets semimonthly, and sometimes weekly. The county or "Pomona" grange meets monthly or quarterly. The State grange is an annual gathering with a large number of delegates and visitors from all parts of the State. The National Grange, although a small body officially, draws a large number of visiting members. All these meetings give ample scope for social entertainment and culture. The more truly educational work of the order is encouraged through the presentation of literary programs at each meeting of the county and subordinate granges. The lecturer is virtually the program committee, and through the efforts of the national and State lecturers this form of work is being rapidly systematized and extended. The Grange also takes an active part in legislative affairs, but always in a non-partizan way. Public questions are constantly discussed at the meetings, and committees present the views and wishes of the order before Legislatures and Congress. Not a little legislation, both State and national, has been secured through the assistance, and often by the initiation of the Grange. The Grange also renders financial assistance to the farmer, largely through cooperative purchases and fire insurance. The State grange makes contracts for goods at reduced rates with wholesale or jobbing houses.

The orders come through the subordinate grange, the goods being paid for on delivery. Binding-twine, fertilizers, farm machinery, are perhaps the leading articles purchased, although trade contracts exist for almost everything the farmer needs. Grange fire-insurance exists in a number of the States, the best example being in New York, where about \$100,000,000 worth of risks is carried by Grange companies, at an average annual rate of about \$1 a thousand.

The annual meeting of the National Grange in 1902 was held in Lansing, Mich., Nov. 12-21. Delegates from 28 States were present. As a whole, the meeting was of interest chiefly because of the showing made in the growth of the order. So far as any reports or resolutions are concerned, there was no unusual or radical action. The nearest approach to this was a resolution favoring Government ownership of railways. This resolution was not

pressed, however, and did not come up for debate. The report of the Committee on Transportation was a vigorous arraignment of railway discrimination, and Attorney-General Knox, Commissioner Prouty, and Prof. Ely were quoted to illustrate the prevalence and results of this discrimination. The Grange had a good deal to do with securing the Interstate

AARON JONES.

Commerce Commission, and is still in favor of giving that commission ample powers. It is undoubtedly the sentiment of the Grange that all possible resources along this line should be exhausted before Government ownership is seriously discussed.

So far as trusts are concerned, the Grange three years ago approved the following recommendations unanimously, and this statement may be said to represent the present Grange sentiment as to trust legislation:

"It must be made impossible for so-called trusts to accumulate millions by selling watered stock without adding to the wealth of the country. Therefore, we recommend:

"First, official inspection of all corporations, as in case of national banks. No corporation should be tolerated whose books can not bear such inspection.

"Second, prohibition of all rebates or discriminations by public carriers.

"Third, taxation of all capital stock.

"Fourth, all capital stock should be paid in full.

"Fifth, severe penalties for violation of law—first, by forfeiture of charter, fine, and imprisonment; second, by impeachment, fine, and imprisonment of all public officials whose duty it may be to enforce the law and who fail to perform that duty."

The National Grange does not prepare a general platform expressing its stand on public questions. The nearest approach to this is contained in the following quotation from the address of National Master Jones at the last session of the National Grange, which may be considered the official state-

ment of the position of the National Grange on the subjects named.

"I again call attention to the legislation demanded by the agricultural interests of the country, considered, approved, and urged at the thirty-third, thirty-fourth, and thirty-fifth annual sessions of the National Grange. For the arguments in support of the legislation demanded I respectfully refer to the Journal of Proceedings of the thirty-third, thirty-fourth, and thirty-fifth annual sessions, and the action of the various committees and the addresses of the Legislative Committee to the Congress of the United States.

"1. Free delivery of mails in the rural districts, and that the service be placed on the same permanent footing as the delivery of mail in the cities, and that appropriations be commensurate with the demands and the benefits of the service.

"2. Provide for postal savings-banks.

"3. Submit an amendment to the Constitution providing for the election of United States Senators by direct vote of the people.

"4. Submit an amendment to the Constitution granting the power to Congress to regulate and control all corporations and combinations, preventing monopoly and the use of their corporate power to restrain trade or arbitrarily establish prices.

"5. Enlarge the powers and duties of the Interstate Commerce Commission as provided in Senate bill No. 1430 [the Cullom bill].

"6. Regulate the use of shoddy.

"7. Enact pure food laws.

"8. Provide for the extension of the markets for farm-products equally with manufactured articles.

"9. The enactment of the antitrust law, clearly defining what acts on the part of any corporation would be detrimental to public welfare.

"10. Speedy construction of the Nicaragua Canal by the United States [secured by the passage of the Isthmian Canal bill].

"11. The speedy construction of a ship-canal connecting the Mississippi river with the Great Lakes and the Great Lakes with the Atlantic Ocean.

"12. Revising the fees and salaries of all Federal officers, and placing them on a basis of similar service in private business.

"13. Protect the dairy interests by the passage of House bill No. 3717 [secured by the enactment into law of the Grout bill]."

To this ought to be added the sturdy opposition of the Grange to the passage of the ship subsidy bill. The Grange at its last meeting also placed itself on record as favoring the gradual introduction of the plan of centralizing the rural schools, and approved a vigorous committee report containing a severe criticism of those agricultural colleges which have failed to give adequate attention to farm problems.

The Master of the National Grange is Aaron Jones, of South Bend, Ind.; the Secretary is John Trimble, No. 514 F Street, Washington, D. C.

GREAT BRITAIN AND IRELAND, a monarchy in western Europe consisting of the Kingdom of England, with the Principality of Wales, united with the Kingdom of Scotland, forming together the Kingdom of Great Britain, with which is united the Kingdom of Ireland, the whole constituting the United Kingdom of Great Britain and Ireland, which holds supreme dominion over the Empire of India and over colonies and dependencies of various classes—self-governing federations and colonies, colonies governed partly by the Crown but having representative institutions, Crown colonies, and protectorates under native laws and rulers—constituting with the United Kingdom the British Empire.

The reigning sovereign is Edward VII, King of the United Kingdom of Great Britain and Ireland and of the British dominions beyond the seas and Emperor of India, eldest son of Victoria I and Prince Albert of Saxe-Coburg-Gotha, born Nov. 9, 1841, who succeeded to the throne on the death of his mother, Jan. 22, 1901. The heir apparent is George, Prince of Wales, son of King Edward and Alexandra, daughter of King Christian IX of Denmark, born June 3, 1865, married on July 6, 1893, to Victoria, daughter of the Duke of Teck.

The power to legislate for the United Kingdom and, except in so far as the power has been delegated to local legislative authorities, for all the members of the British Empire is vested in the British Parliament, consisting of a House of Lords and a House of Commons. Members of the House of Lords are the princes of the royal blood; spiritual lords, who are the metropolitan bishops of ancient English sees; hereditary peers of England, of Great Britain, and of the United Kingdom; representative peers of Scotland, elected by their fellow peers for the duration of Parliament; representative peers of Ireland, elected for life; and life peers and law lords. The number of peers on the roll of Parliament in 1901 was 592. The House of Commons contains 670 members, elected in boroughs, counties, and universities by the votes of all male householders and lodgers, by secret ballot. England, with 5,389,865 electors in 1901, is represented by 495 members, of whom 253 are elected by 3,046,900 county electors, 237 by 2,325,263 borough electors, and 5 by 17,702 university electors; Scotland, with 696,869 electors, by 72 members, of whom 39 are elected by 382,629 county electors, 31 by 294,643 borough electors, and 2 by 19,597 university electors; Ireland, having a total of 735,851 electors, by 103 members, of whom 85 are elected by 622,465 county electors, 16 by 108,667 borough electors, and 2 by 4,719 university electors. The Committee of Ministers, called the Cabinet, representing the majority for the time being in the House of Commons, exercises in reality the executive authority that is nominally vested in the Crown. The Prime Minister chooses his colleagues and dispenses the patronage of the Crown; he initiates the policy of the Government or approves the measures suggested in their several departments by the other ministers, and when his policy or acts encounter the displeasure of Parliament, manifested by an adverse vote on a Cabinet question or by a direct vote of want of confidence, he either resigns with the rest of the Cabinet forthwith or he appeals to the country by dissolving Parliament and ordering new elections. When a Cabinet resigns the retiring Prime Minister advises the sovereign as to the selection of the statesman most competent to form a new Government, usually the leader of the Opposition in the House of Commons. The Cabinet formed on Nov. 1, 1900, and continued in office on the accession of Edward VII, was composed in the beginning of 1902 as follows: Prime Minister and Lord Privy Seal, the Marquis of Salisbury; Lord President of the Council, the Duke of Devonshire; Lord High Chancellor, the Earl of Halsbury; Secretary of State for Foreign Affairs, the Marquis of Lansdowne; Chancellor of the Duchy of Lancaster, Lord James of Hereford; First Lord of the Treasury, Arthur J. Balfour; Secretary of State for the Home Department, C. T. Ritchie; Chancellor of the Exchequer, Sir Michael E. Hicks-Beach; Secretary of State for the Colonies, Joseph Chamberlain; Secretary of State for War, W. St. John F. Brodrick; Secre-

tary of State for India, Lord George Hamilton; First Lord of the Admiralty, the Earl of Selborne; President of the Local Government Board, W. H. Long; President of the Board of Trade, Gerald Balfour; Lord Lieutenant of Ireland, Earl Cadogan; Lord Chancellor of Ireland, Lord Ashbourne; Secretary for Scotland, Lord Balfour, of Burleigh; First Commissioner of Works, A. Akers-Douglas; Lord President of the Board of Agriculture, R. W. Hanbury; Postmaster-General, the Marquis of Londonderry.

Area and Population.—The area of the divisions of the United Kingdom and their population at the census of April 1, 1901, are given in the following table:

DIVISIONS.	Square Miles.	Population.
England and Wales.....	58,809	32,526,075
Scotland.....	29,785	4,472,103
Ireland.....	32,568	4,466,546
Isle of Man.....	227	54,768
Channel Islands.....	75	96,841
Total.....	120,979	41,606,332

The annual rate of increase between 1891 and 1901 was 1.21 per cent. in England, 1.33 per cent. in Wales, 1.11 per cent. in Scotland, and 0.19 per cent. in the Channel Islands, while the population of Ireland decreased at the average rate of 0.53 per cent. per annum. The population in England and Wales consisted of 15,721,728 males and 16,804,347 females; in Scotland, 2,173,755 males and 2,298,348 females; in Ireland, 2,197,739 males and 2,258,807 females; in the Isle of Man, 25,486 males and 29,272 females; in the Channel Islands, 45,205 males and 50,636 females. Of the total population of the United Kingdom in 1900 England contained 74.1 per cent., Wales 4.1 per cent., Scotland 10.8 per cent., Ireland 10.7 per cent., the Isle of Man 0.1 per cent., the Channel Islands 0.2 per cent. In 1851 England contained 61 per cent. of the total population, Wales 3.6 per cent., Scotland 10.4 per cent., Ireland 23.7 per cent., the Isle of Man 0.2 per cent., the Channel Islands 0.3 per cent. Of the total population of England and Wales 24 per cent. in 1901 lived in 9 towns which had 250,000 inhabitants and upward. London had 4,536,541 inhabitants within the registration area, 6,580,616 including the outer ring. The population of the metropolis has increased nearly fivefold in a century, but for the last half-century the rate of increase has declined, except in the suburban districts of greater London, which have grown rapidly. The population of the other towns was: Liverpool, 684,947; Manchester, 543,969; Birmingham, 522,182; Leeds, 428,953; Sheffield, 380,717; Bristol, 328,842; Bradford, 279,809; West Ham, 267,308. Towns having from 100,000 to 250,000 contained 10 per cent. of the population. Kingston-upon-Hull had 240,618 inhabitants; Nottingham, 239,753; Salford, 220,956; Newcastle, 214,803; Leicester, 211,574; Portsmouth, 189,160; Bolton, 168,205; Cardiff, 164,420; Sunderland, 146,565; Oldham, 137,238; Croydon, 133,885; Blackburn, 127,527; Brighton, 123,478; Preston, 112,982; Norwich, 111,728; Birkenhead, 110,926; Gateshead, 109,926; Plymouth, 107,509; Derby, 105,785; Halifax, 104,933; Southampton, 104,911. The urban population of England and Wales was 77 per cent. of the total population, the rural population 23 per cent. In Scotland 75.3 per cent. of the population lived in town districts, 22 per cent. in rural districts on the mainland, and 2.7 per cent. on the islands. The town districts increased 15.12 per cent. in ten years,

and the rural districts of the mainland increased in population 0.87 per cent., but on the islands the population decreased 3.4 per cent., the average increase for the whole of Scotland being 11.09 per cent. Glasgow in 1901 had 735,906 inhabitants; Edinburgh, 316,479; Dundee, 160,871; Aberdeen, 143,722. In Ireland 23.2 per cent. of the people lived in towns of 10,000 inhabitants and over. Dublin had 286,328 inhabitants, but in the metropolitan police district there were 379,861; Belfast had 348,876.

The number of marriages in England and Wales in 1900 was 257,139; of births, 926,304; of deaths, 587,459; excess of births, 338,845. In Scotland the number of marriages was 32,449; of births, 131,355; of deaths, 82,267; excess of births, 49,088. In Ireland the number of marriages was 21,330; of births, 101,459; of deaths, 87,606; excess of births, 13,853. The emigration from the United Kingdom in 1901 was 302,848, against 298,561 in 1900. Of the emigrants 111,922 were English, 20,954 Scotch, 39,194 Irish, and the rest foreigners. The immigration of British and Irish was 172,140, against 168,825 in 1900. Of these 104,257 were bound for the United States, 15,868 for British North America, 15,376 for Australasia, 23,254 for Cape Colony and Natal, and 13,385 for other places. Of the emigrants who sailed in 1900 from British ports, 177,447 were males and 121,114 females. Of those of British and Irish origin, 96,102 were males and 72,723 females. There were 97,637 immigrants of British and Irish origin in 1900, so that the net decrease of native population by emigration was only 71,188. The total number of immigrants was 175,747, leaving the net emigration 122,814.

Finances.—The budget estimate of revenue for the year ending March 31, 1901, was £127,520,000, and the estimated expenditure, including supplementary estimates, was £184,599,627. The actual receipts for the year were £130,384,684, and the actual expenditure was £183,592,264. The year ended with a deficit of £53,207,580 to be added to one of £13,882,502 for 1899. The revenue collected by the Government in 1901 was £140,354,970, of which £9,710,034 were paid to local taxation accounts, leaving for the exchequer £130,384,684. Taxation produced 84 per cent. of the whole. The net receipts from customs were £26,270,959, of which £12,838,578 were collected from tobacco, £6,264,515 from tea, £2,344,907 from rum, £1,417,346 from brandy, £1,007,509 from other spirits, £1,488,453 from wines, £63,846 from currants, £189,783 from coffee, £194,161 from raisins, £175,984 from cocoa, and £285,877 from other articles. The yield of excise duties was £33,286,588, of which £19,206,690 were obtained from spirits, £13,490,620 from beer, £331,214 from railroads, £250,256 from license duties, and £7,808 from other sources. The estate duty produced £8,489,872, the temporary estate duty £20,625, the probate duty £42,529, legacy duty £3,092,380, succession duty £793,016, corporation duty, £44,840; total from death duties, etc., £12,483,262. The yield from stamps, etc., was £7,886,857, of which deeds produced £3,618,437, receipts £1,447,447, bills of exchange £692,660, patent medicines £297,480, licenses £170,302, the duty on the capital of companies £761,974, bonds to bearer £191,180, insurances £260,372, other sources £447,005. The yield of the land tax was £765,869; of the house duty, £1,701,085; of the property and income tax, £27,561,161. Of the non-tax receipts, £20,689,155 in all, £13,776,886 came from the post-office, £3,380,589 from the telegraph service £464,444 from Crown lands, £830,

075 from interest on Suez Canal shares, and £2,237,161 from miscellaneous sources, including £947,553 from fee stamps, £923,997 from the mint, £178,188 from the Bank of England, and £187,423 from various sources. The expenditure in 1901 under the head of consolidated fund charges was £22,557,264, of which £15,106,532 were for interest on the funded debt, £2,756,612 for terminable annuities, £415,254 for interest of unfunded debt, and £174,310 for management of the debt, making the national-debt service £18,452,708, not including £1,382,780 of interest on the war debt outside of the fixed charge. Other consolidated fund charges were £409,452 for the civil list, £259,905 for annuities and pensions, £78,872 for salaries, etc., £515,848 for courts of justice, and £305,330 of miscellaneous payments. The expenditure for the supply services was £161,035,000, of which £91,505,900 went for the army, £204,100 for ordnance factories, £29,520,000 for the navy, £23,500,000 for civil services, £2,834,000 for customs and internal revenue, £8,963,000 for the post-office, £3,737,000 for the telegraph service, and £771,000 for packet service. In addition to the ordinary expenditures, amounting to £183,592,264, there were expenditures under the barracks act of £56,087; under the telegraph acts, £1,060,000; under the naval works act, £2,135,000; under the military works act, £1,200,000; under the land registry act, £25,000; total, £4,914,587. The money raised by creating additional debt under the war loan acts of 1900 amounted to £52,163,300; and bills were renewed to the amount of £24,133,000. The balance in the exchequer on April 1, 1900, was £3,517,047. The gross receipts during 1901 were £241,176,686, and the gross disbursements were £239,096,815, leaving a balance of £5,596,918 on March 31, 1901. The cost of the British army for the year ending March 31, 1902, was estimated at £87,915,000, not including £3,866,539 of appropriations in aid. The expenditure on effective services was £83,970,500, including £15,977,000 for transport and remounts, £18,782,000 for provisions and forage, £13,902,600 for general staff and regimental pay, £13,450,000 for warlike stores, £4,825,000 for clothing, £3,281,000 for works and buildings, £2,650,000 for the South African local forces, £2,540,000 for gratuities to troops, £2,662,000 for the militia, £1,230,000 for the auxiliary volunteer corps, £375,000 for the yeomanry, £660,000 for the colonial contingents, £630,000 for the China expeditionary force, £1,000,000 for yeomanry and volunteers in the reserves, £200,000 for the regular army reserve, £1,088,600 for medical establishments, £84,900 for the chaplains' department, £119,200 for military education, £218,200 for miscellaneous services, and £305,000 for the War Office. For pensions, retired pay, and other non-effective services the disbursements amounted to £3,944,500. The estimated cost of the navy, not including £1,089,473 of appropriations in aid, was £30,875,500 in 1902, of which £14,676,000 went for ship-building and repairs, £5,760,000 for wages of officers, seamen, and marines, £3,919,700 for naval armaments, £1,892,000 for victualing and clothing, £279,600 for the Admiralty Office, £1,023,100 for works and buildings, £219,000 for medical establishments, £292,100 for the naval reserves, £100,600 for educational services, £65,800 for scientific services, £16,200 for martial law, and £359,500 for miscellaneous services, making a total of £28,603,900 for effective services, while for pensions, half-pay, etc., the expenditures were £2,271,000. The estimates for civil

services in 1902 amounted to £23,630,120, of which £2,074,615 were for public works and buildings, £3,857,779 for law and justice, £2,616,614 for salaries and expenses in the civil departments, £12,790,743 for education, £1,651,957 for foreign and colonial services (including £490,052 for the diplomatic and consular service, £538,006 for the colonial service, £546,049 for Cyprus, Uganda, etc., and £77,850 for subsidies to telegraphs), £608,968 for non-effective and charitable services, and £29,444 for miscellaneous expenses. The income tax in 1902 was 14d. in the pound, estimated to produce £33,800,000. The gross amount of the annual value of property and profits assessed to income tax in 1900 was £788,023,603, having grown from £465,594,366 in 1871. The share of England in 1900 was £678,742,789; of Scotland, £75,833,242; of Ireland, £33,447,572. The annual value of lands assessed to income tax in 1900 was £37,110,545 in England, £5,956,530 in Scotland, and £9,747,216 in Ireland; total, £52,814,291. The annual value of houses was £153,193,414 in England, £16,663,967 in Scotland, and £4,573,120 in Ireland; total, £174,430,501. The annual value of railroads assessed to income tax was £39,357,677; of mines and quarries, £11,073,418; of gas-works, £6,503,433; of water-works, £4,614,317; of canals, etc., £3,476,916; of iron-works and other public concerns, £129,398,488. Additional beer and spirit duties, excise licenses, and a share in the probate duty and the estate duty are collected by the Government and paid over to the local authorities. The net receipts for the year ending March 31, 1901, were £9,710,033, of which £1,585,898 were the additional beer and spirit duty, £3,886,269 licenses, and £4,237,867 the share of probate and estate duties. The payments made to local taxation accounts in the same year amounted to £9,739,626, of which £8,310,739 were in England, £1,027,412 in Scotland, and £401,475 in Ireland. Out of a total revenue of £140,353,000 in 1901, including the local taxation revenue, £113,244,000 were contributed by England, £14,919,000 by Scotland, and £9,505,500 by Ireland, while £2,685,000 came from outside sources. Of a total expenditure of £193,331,000 the sum of £146,295,000 went for imperial services and £34,769,000 were expended on English, £4,961,000 on Scottish, and £7,306,000 on Irish services.

The gross liabilities of the state on March 31, 1901, amounted to £705,723,878, of which £551,182,153 were funded debt, £61,677,469 the estimated capital value of terminable annuities, and £78,133,000 unfunded debt, making the total capital of the national debt £690,992,622. Other capital liabilities were £241,115 under the Russian Dutch loan act of 1891, £2,657,801 under the barracks act of 1890, £1,827,130 under telegraph acts, £2,873,324 under the naval works acts of 1895 and 1899, £4,082,662 under the Uganda Railway acts, £450,400 and £509,799 under the public offices acts of 1895 and 1897, £847,942 under the Royal Niger Company act of 1899, £1,216,077 under military works acts, and £25,006 under the land registry act of 1900; total, £14,731,256. The assets of the Government were Suez Canal shares of the market value of £25,806,000 and £712,760 of other assets, besides exchequer balances in bank amounting to £5,596,918.

The revenue for 1902 exceeded the budget estimate of £142,455,000 by £543,000. The budget estimate of expenditure was £184,212,000, to which £12,631,000 of supplementary estimates were added in consequence of the war, but savings

reduced the total expenditure to £195,522,000, leaving a deficit of £52,524,000, which was provided for out of consols issued in the spring of 1901 which produced the net sum of £56,553,000, leaving a balance of £4,029,000. Out of the total expenditure for the year £73,197,000 went for war charges in South Africa and China, including £3,367,000 of interest on the war debt. Deducting this, the expenditure for the war during the year was £69,830,000, of which £63,230,000 were military and £6,600,000 civil expenditure. Toward this £17,306,000 were contributed from the revenue, including £4,681,000 of revenue saved by the suspension of the sinking-fund. The total cost of the wars up to March 31, 1902, was £165,034,000, made up of £4,967,000 of interest on the war debt, £154,407,000 of supply grants for South Africa, and £5,660,000 of supply grants for China. It was defrayed by £119,614,000 of loans and £45,420,000 paid out of revenue. The British share of the Chinese indemnity amounts to £6,000,000. Of the South African War debt, £30,000,000 are expected to be repaid from the wealth of the Transvaal. The receipts from tobacco and spirits in 1902 showed a large falling off owing to forestalments of duty in the previous year. There was a decrease in the consumption of beer, which was counterbalanced by a large increase in the consumption of tea and cocoa. The sugar duty produced £6,390,000, exceeding the estimate by £1,290,000, mainly because of forestalments in anticipation of an increased duty; yet in spite of the duty of 4s. 2d. a hundredweight the additional price of ½d. a pound to the consumer charged at first receded to half as much. The coal duty produced £1,314,000 on a total export of 44,064,000 tons, compared with 45,133,000 tons in the previous year and 43,694,000 tons in 1900. The imports of British coal into Hamburg fell off no more than those from other countries and the competition of American coal in Mediterranean ports, which began with the high prices of 1900, declined with the fall in price. Wine duties fell off £38,000; the tobacco revenue, from £12,839,000 to £10,565,000; excise duties, from £33,100,000 to £31,600,000, beer producing only £13,300,000, the decrease in two consecutive years being attributed to the dilution of beer by the brewers on account of the tax. The death duties amounted to £18,398,000, including £4,198,000 paid over to the local taxation fund. The exchequer receipts from this source were £1,220,000 more than in the previous year and £200,000 more than the estimate. Stamps produced £7,800,000, a falling off of £25,000. The yield of the income tax was £34,800,000, which was £1,000,000 more than the estimate. The exchequer balances on March 31, 1902, amounted to £8,567,000, including surplus receipts from the consols loan of £60,000,000. The national debt was increased by this loan to £768,408,000, including £20,532,000 expended on reproductive works and repaid by annual votes. Deducting this, the dead weight of the debt was £747,876,000, which was £59,884,000 more than in the previous year. Including the amounts paid into the local taxation account and expenditure for military and naval works, the Uganda Railroad, the Pacific cable, and other purposes, the total expenditure for 1902 was £212,783,000. The expenditure for the year ending March 31, 1903, was estimated at £29,450,000 for charges on the consolidated fund, £69,665,000 for army services, £31,255,000 for the navy, £26,448,000 for civil service, £3,039,000 for customs and inland revenue, £14,752,000 for the postal and telegraph services; total, £174,609,000. On the

existing basis of taxation customs duties were expected to yield £32,800,000, excise £32,700,000, death duties £13,200,000, stamps £8,200,000, the land tax £740,000, the house duty £1,760,000, the income tax £36,000,000; total, £126,000,000, besides £21,785,000 of non-tax revenue, which raises the total income to £147,785,000. This left a deficiency of £26,824,000 to provide for, but if the South African War continued this might be swelled by over £16,000,000, and expenses of the South African constabulary and grants to the West Indian colonies pending the abolition of sugar bounties, with interest on new debts to be incurred, would add to the deficit, which was estimated at a total of £45,500,000 on the contingency of the continuance of hostilities, whereas if they ceased gratuities and bounties to soldiers, transportation of reservists home, the maintenance of a considerable force in Africa, and means to be provided for restocking and rebuilding the devastated farms and resettling the two colonies would require large sums, though the new colonies may later repay such advances. Of the estimated deficit £4,500,000 would be obtained by suspending the sinking-fund for another year. Another increase of 1d. in the income tax, making it 1s. 3d. in the pound, was expected to yield £2,000,000. Doubling the stamp tax of 1d. on checks would produce £500,000. Besides these increased taxes a tax on imported grain, a registration duty such as was abolished in 1869, was introduced and fixed at 3d. a hundredweight on all kinds of cereals, dried peas and beans, uncleaned rice, etc., and 5d. on flour, meal, starch, cleaned rice, etc.; and of this the estimated yield is £2,650,000, making the total receipts from new taxation £5,150,000, reducing the estimated deficit to £35,500,000, of which £32,000,000 was to be borrowed and the remainder paid out of the unexpended exchequer balances. The total estimated expenditure is £188,469,000. The estimates of revenue, including the new taxes, were £235,450,000 from customs, £32,700,000 from excise, £13,200,000 from death duties, £8,700,000 from stamps, £2,500,000 from land tax and house duty, £38,600,000 from income tax, £21,785,000 of non-tax revenue; total, £152,935,000.

The Army.—The army estimates for the year ending March 31, 1902, fixed the strength of the regular army of the United Kingdom at 9,745 commissioned officers, 1,485 warrant officers, 19,604 sergeants, 4,533 drummers and musicians, and 184,433 rank and file, making a total of 219,800 men of all ranks, an increase of 7,351 over the authorized strength for 1901. The general and departmental staff consisted of 367 officers, with 130 non-commissioned officers and 6 soldiers, on the general staff, 236 army accountants, 86 officers in the chaplains' department, 96 in the medical department, and 110, with 6 non-commissioned officers and 1 man, in the veterinary department; total, 805 officers, with 136 non-commissioned officers and 7 men. The regimental establishments comprised 555 officers, 1,339 non-commissioned officers, and 12,376 rank and file in the cavalry; 1,541 officers, 3,366 non-commissioned officers, and 34,735 rank and file in the royal artillery; 702 officers, 1,586 non-commissioned officers, and 7,843 rank and file in the royal engineers; 3,501 officers, 8,479 non-commissioned officers, and 106,963 rank and file in the infantry; 419 officers, 934 non-commissioned officers, and 13,082 rank and file in colonial and native Indian corps; 248 officers, 1,172 non-commissioned officers, and 1,400 rank and file in departmental corps; 490 officers, 1,299 non-commissioned officers, and 5,285 rank and file in the army service

corps; and 551 officers, 485 non-commissioned officers, and 2,560 rank and file in the medical corps; total, 8,007 officers, 18,660 non-commissioned officers, and 184,244 rank and file, with 25,402 horses. The army vote provided further for 230,200 imperial, colonial, Indian, and irregular forces during the war in South Africa and for the expeditionary force in China, increasing the total number to 450,000, exclusive of the army in India. The numbers of troops of all ranks maintained for service in the United Kingdom on Jan. 1, 1899, were 11,676 cavalry, 17,572 artillery, 5,351 engineers and 72,087 infantry and special corps; total, 106,686, with 13,892 horses and mules. Of these, 79,057, with 10,642 horses, were stationed in England and Wales; 3,942, with 345 horses, in Scotland; and 23,687, with 2,905 horses, in Ireland. The numbers serving abroad at that date were 4,257, with 769 horses, in Egypt; 44,605, with 2,317 horses, in the colonies; 74,466, with 12,303 horses, in India; and 1,837 in Crete; total, 125,165, with 15,389 horses and mules. The total effective strength of the British regular army on Jan. 1, 1899, was therefore 231,861 officers and men, with 29,281 horses. The reserves and auxiliary forces consist of the army reserve, the militia, the mounted yeomanry, and the volunteers. The authorized strength of the military forces of the empire, according to the estimates for the year ending March 31, 1902, was as follows: Regular forces, home and colonial, 207,215; native Indian regiments, 3,696; army reserve, first class, 90,000; militia, 131,539; new militia reserve, 50,000; militia of the Channel Islands, 3,271; militia of Malta and Bermuda, 2,731; yeomanry, 35,000; volunteers, 375,000; regular forces on the Indian establishment, 73,518; total, 971,970. The effective strength of the various classes of troops as reported on Jan. 1, 1901, was as follows: Regular forces, home and colonial, 335,837, including 9,354 yeomanry and 7,000 enlisted volunteers; native Indian regiments, 22,313, including 19,126 men serving in the China expedition; army reserve, first class, 5,251, including 2,163 enlisted volunteers; militia of the United Kingdom, 100,098; militia of the Channel Islands, 3,428; militia of Malta and Bermuda, 2,098; yeomanry, 8,657; volunteers, 277,900; regular forces on the Indian establishment, 63,023; total effectives, 818,605. This includes the British, but not the colonial forces, serving in South Africa. The strength of the army in South Africa on Feb. 1, 1901, was 141,490 regulars; 28,339 colonials, not including the latest levies not yet reported; 7,995 imperial yeomanry; 7,700 volunteers; and 19,425 militia; total, 204,949. The regular forces consisted of 4,305 officers and 137,085 rank and file, the latter comprising 12,600 cavalry, 12,000 artillery, 99,700 infantry, and 12,885 other troops. Under the old system there were 12 military districts in the United Kingdom, subdivided into 67 regimental districts, each of which was the recruiting ground for a regiment, with which were linked the district militia and volunteers. According to the resolution of the House of Commons adopted on May 16, 1901, the army is to be organized in 6 army corps, with staff, buildings, and stores for each; a militia reserve of 50,000 men will be formed, and the yeomanry will be increased from 12,000 to 35,000; and 8 regiments outside of the army corps are to be recruited for garrison service. The first three army corps, quartered respectively at Aldershot, on Salisbury Plain, and in Ireland, will be available for either home defense or foreign service. The other three, quartered at Colchester, at York, and in Scotland, will have distributed among

them 60 battalions of militia and volunteers. The force to be maintained when the new organization is perfected will comprise 155,000 regulars in the United Kingdom, an army reserve of 90,000 men, 150,000 militia, 35,000 yeomanry, and 250,000 volunteers. Under the short-service system men enlist in the regular army for twelve years, serving in the active army from three to seven years, and for the remainder of the term belonging to the reserve. The number of recruits enlisted in the army during the year ending Nov. 30, 1899, was 36,636, of whom 34.9 per cent. were below standard height; militia recruits, 37,379. The regular army on Jan. 1, 1899, was composed of 165,038 Englishmen, 17,285 Scotchmen, 28,358 Irishmen, 10,015 born in the colonies and India, 97 foreigners, and 1,580 not reported. The strength of the British army has been increased from 70,000 men in 1872 to 212,000 in 1897, 229,000 in 1899, and 250,000 in 1902, with a reserve of 90,000. The effective strength in 1902 was not over 210,000. The number of recruits in 1896 was 27,800; in 1897, 33,700; in 1898, when the standard was lowered, 38,400; in 1899, 40,200; in 1900, when the standard was lowered a second time and the war stimulated enlistment, 46,700; in 1901, with the war still continuing, 45,100. The waste in deserters and invalids was 3,485 in 1899, and in 1900 it rose to 5,484 and in 1901 to 8,822. The available reserves were decreased by the war from 81,000 at the beginning of the war to 20,000 or 30,000. Bounties were paid to 16,000 men in India to induce them to remain with the colors instead of going into the reserve. To fill the ranks, which at the existing rate of recruiting would be 50,000 men short, the Government in 1902 raised the pay, which was nominally 1s. a day, but actually from 8d. to 10d., to a clear shilling. According to the plan adopted soldiers are enlisted for three years. At the end of two years a soldier, if efficient and of good character, is allowed to choose whether at the end of his term of three years he will pass into the reserve for nine years or whether he will serve with the colors for six years longer, making eight years in all, and then go into the reserve for four years. These reenlisted soldiers receive 1s. 6d. a day, except such as are not up to the average in shooting, who when they are reengaged only get 4d. a day extra until they become efficient shots, and after that the full 6d. The extra pay is expected to induce 50 per cent. of the soldiers to reenlist and furnish 50,000 recruits a year, which will keep the army full and give a reserve of 150,000 or 175,000 men. The additional cost is estimated at £1,048,000 to the British and £786,000 to the Indian Government per annum. When the South African War broke out the effectives in the British army, exclusive of India, but including the reserves, were 240,000 men. The regular troops in South Africa, exclusive of colonial troops, militia, volunteers, and yeomanry, have been about 150,000. The total number landed in thirty months was 230,000, of whom 220,000 came from Great Britain. At the close of the war the number drawing rations in South Africa, including army attendants, was over 300,000 men, with 243,000 horses and mules. The estimates voted by Parliament for 1903, amounting to £69,310,000, provided for 420,000 men all told. The program for 1903 included reforms in the volunteer corps in Great Britain, which must be trained so as to stand in the first line of defense in case of invasion if the United Kingdom is to escape the necessity of conscription. Men who have been trained in the volunteers for four years will be allowed to go into a volunteer re-

serve for six years on the condition that they practise shooting at the range once in two years. A yeomanry reserve will be created, of the maximum strength of 5,000 men, who will receive £5 a year each and must be willing to serve abroad in case the whole army reserve is mobilized. Another yeomanry reserve, consisting of men able to ride and shoot, but circumstanced so that they can not go into camp for two weeks every year, will be available, like the volunteer reserve, for home defense. The militia, artillery, and engineers will be improved and increased, and a militia reserve is to be created. Militia officers will be allowed to serve temporarily with line regiments, and the conditions of service in the regular army for officers will be changed by lightening the incidental expenses that keep out men of small means, improving their military education, and rewarding professional work and efficiency. Drill will be changed on the principle that the company, not the battalion, is the practical unit, and companies will be drilled in rifle exercises, bayonet fighting, skirmishing, and signal exercises for eight months of the year, while unnecessary parade drill and manual and bayonet exercises will be abolished. The plan of increasing the yeomanry by 21 regiments adopted in 1901 was carried out to a great extent, two-thirds of them having been raised at the end of the fiscal year 1902, increasing the number of men from 10,000 to 17,500. Of 8 garrison regiments to be recruited among soldiers who had served their time 5 were already formed. The army-corps scheme remained in abeyance while the war was still going on. Buildings and training grounds were being got ready, and a system of decentralization and delegation of powers was being introduced in the organization of the army, but even the 1st army corps at Aldershot still remained on paper only. The concentration camps in South Africa, scandals in the purchase of horses and supplies, and other matters connected with the war gave occasion for investigations. In the concentration camps the military authorities had to provide food, shelter, and clothing for 150,000 persons outside of the army. Provision had to be made, moreover, for prisoners of war in five different colonies and dependencies. The remounts and transport animals shipped to South Africa consisted of 290,000 horses and 126,000 mules, besides 120,000 horses purchased locally.

The Navy.—The British navy on Jan. 1, 1901, comprised 14 first-class, 12 second-class, and 11 third-class battle-ships, 6 armored cruisers, 125 protected cruisers, 33 torpedo-gunboats and others, 96 destroyers, 2 torpedo-ships, and 11 first-class and 71 second-class torpedo-boats. There were 13 obsolete battle-ships, 10 coast-defense vessels, and 95 third-class gunboats which were not counted in the effective navy, and also numerous river gunboats. Already launched, but not yet ready for sea, there were 7 first-class battle-ships, 8 armored cruisers, and 1 destroyer. In process of building or authorized to be built there were 8 more first-class battle-ships, 6 armored cruisers, 2 protected cruisers, 12 destroyers, and 4 first-class torpedo-boats. The *personnel* of the navy, for which the estimates of the year ending March 31, 1902, provided, comprised 85,323 naval officers and seamen, including 3,700 boys serving on the ships, 4,200 in the coast-guard, and 19,590 marines on sea service, 6,200 boys in training, 440 cadets and engineer students, 1,048 pensioners, and 1,824 others; total, 118,625, against 114,880 in 1901. The increase of 4,240 over the previous year included 287 officers, 1,150 seamen,

1,000 marines, 398 miscellaneous, 500 stokers, 100 electricians, 210 other artisans, and 100 apprenticed shipwrights and coopers. The naval reserve numbered 23,000 seamen. Parliament authorized the gradual increase in five years of flag-officers from 68 to 80, of captains from 208 to 245, of commanders from 304 to 350, of lieutenants from 1,150 to 1,550, of engineer officers from 950 to 1,050, of doctors from 450 to 490, of gunners and boatswains from 920 to 1,150, of chief carpenters from 18 to 20, of carpenters from 207 to 240. The canteen system is to be improved, the number of meals on shipboard increased from 3 to 5, and the standard of living for the sailors made to correspond in some degree with the higher standard on land. The system of subsidizing merchant steamers as auxiliary cruisers has been altered, so that 18 of the fastest liners will receive regular subsidies and be ready to be converted at any time into war-ships and 30

frers, their steam-power and nominal speed being the same as in the latest models. The London, Venerable, and Bulwark, of 14,700 tons, launched in 1899, having 12-inch armor, are armed with 4 12-inch guns and 12 6-inch and 18 3-inch quick-firers, and with engines of 15,000 horse-power can make 18 knots an hour. Of the same size and speed are the Formidable, Irresistible, and Implacable, launched in 1898 and 1899, which carry, besides pairs of 12-inch guns, 12 6-inch quick-firers, 16 3-inch quick-firers. These are of the same type as the Canopus, launched in 1897, of 12,950 tons, whose secondary armament consists of 12 6-inch and 10 3-inch quick-firers and whose speed, with engines of 13,500 horse-power, is 18½ knots, with 12 inches of armor amidships and a 2-inch belt extending to the bow. Of the same class are the Ocean, Goliath, Albion, Glory, and Vengeance, the last of which was launched in 1899. This class was an improvement on the

THE NEW ADMIRALTY HARBOR, AT DOVER.

others will be held at the disposal of the Government.

The latest type of battle-ship, adopted for the King Edward, Dominion, and Commonwealth, of 16,500 tons, with armor of 12 inches thickness and engines of 18,000 horse-power, designed to give a speed of 19 knots, has an armament of 4 12-inch breech-loaders in turrets on the main deck, 4 9.2-inch quick-firers in smaller turrets above, and 10 6-inch and 28 3-inch quick-firers. The Queen and Prince of Wales, of 15,000 tons, with 12-inch armor at the water-line and engines of 18,000 horse-power, giving a speed of 19 knots, carry 4 12-inch guns in fore and aft turrets, 12 6-inch quick-firers in armored casemates, and 18 3-inch quick-firers. This arrangement was followed in all battle-ships from the Royal Sovereign, launched in 1891, and her predecessor, the Hood, and sisters, the Empress of India, Repulse, Royal Oak, Ramillies, Resolution, and Revenge, until it was changed in the King Edward class, which has a complete armored battery on the main deck. The Duncan, Cornwallis, Russell, Exmouth, Montagu, and Albemarle, of 14,000 tons, have 11 inches of armor and, besides pairs of 12-inch guns, carry 12 6-inch and 12 3-inch quick-

Majestic, of 14,900 tons, launched in 1895 and 1896, including the Magnificent, Prince George, Victorious, Jupiter, Caesar, Hannibal, Illustrious, and Mars, which have 14 inches of armor amidships, can steam 17½ knots with engines of 12,000 horse-power, and carry 12 6-inch and 16 3-inch quick-firers besides 4 12-inch guns in the turrets, which were first introduced in this class.

The newest type of armored cruiser is that of the Drake, King Alfred, Leviathan, and Good Hope, of 14,100 tons, which with engines of 30,000 horse-power are designed to steam 23 knots an hour, and are armed with 2 9.2-inch guns and 16 6-inch and 14 3-inch quick-firers. The Berwick, Cornwall, Cumberland, Donegal, Lancaster, and Suffolk, of 9,800 tons, will carry 14 7.5-inch and numerous small quick-firers. The Kent, Monmouth, Bedford, and Essex, of 9,800 tons, will carry 14 6-inch and numerous smaller quick-firers and with engines of 22,000 horse-power are expected to make 22 knots. The Cressy, Hogue, Aboukir, Sutlej, Euryalus, and Bacchante, launched in 1899 and 1900, of 12,000 tons displacement, with an armament of 2 9.2-inch guns in turrets and 12 6-inch and 14 3-inch quick-firers protected by casemates, have engines

of 21,000 horse-power, giving a speed of 21 knots. The *Diadem*, *Andromeda*, *Niobe*, *Europa*, *Spartiate*, *Argonaut*, *Amphitrite*, and *Ariadne*, launched in 1896, 1897, and 1898, are the largest deck-protected cruisers, having a displacement of 11,000 tons, with a quick-firing armament of 16 6-inch, 14 3-inch, and 20 small guns well protected and disposed as in the *Majestic*, and capable of steaming 20½ knots with engines of 16,500 horse-power. The new protected cruisers *Encounter* and *Challenger*, of 5,600 tons, the same size as the *Hermes*, *Hyacinth*, and *Highflyer*, launched in 1898, will carry 12 6-inch and 15 smaller quick-firers and with engines of 9,600 horse-power are designed to make 19½ knots. The latest destroyers made 36 and 37 knots in their trials. In 1901 the *Viper* and *Cobra* went to pieces at sea and an official investigation was ordered for the purpose of determining what was the cause of their weakness. The British Government, while engaged in experiments on the best means of destroying submarine boats or warding off their attacks, begun in 1900 to build submarines of its own, adopting the Holland design, of which type 5 boats were ordered.

The navy estimates for 1903, amounting to £31,255,000, show an increase of £380,000 over 1902, while for new construction £9,058,000 were voted, compared with £9,003,000. The program of new construction includes 2 battle-ships, 2 armored cruisers, 2 third-class cruisers, 4 scouts, 9 destroyers, 4 torpedo-boats, and 4 submarines. The battle-ships of the *Powerful* and *Terrible* class will receive additional guns, and ships of the *Barfleur* and *Centurion* classes will have 4.7-inch replaced by 6-inch guns. The naval scouts or fleet messengers are a new type and class of vessels. The increase in the *personnel* for 1903 is 3,875, making a total of 122,500 officers and men. During the fiscal year ending March 31, 1902, the battle-ships *Formidable*, *Implacable*, *Irresistible*, *Bulwark*, and *Vengeance* and the armored cruisers *Aboukir*, *Cressy*, *Hogue*, and *Sutlej* were completed, together with the protected cruisers *Spartiate* and *Pandora*, 2 royal yachts, 4 sloops, 2 river steamers, 22 destroyers, 4 torpedo-boats, and 5 submarines.

There were under construction on April 1, 1902, 13 battle-ships, 22 armored cruisers, 4 protected cruisers, 4 sloops, 2 auxiliary vessels, 10 destroyers, and 5 torpedo-boats. The vessels to be completed during the year ending March 31, 1903, are 5 battle-ships, 7 armored cruisers, 2 sloops, 2 auxiliary vessels, and 2 destroyers. The future destroyers are to be stronger and to have sea-keeping power to enable them to accompany fleets. The scouts will be still stronger. The existing destroyers, the type of which has proved unseaworthy, will be reconstructed. The *Viper* and the *Cobra*, the first destroyers that foundered, were driven by steam-turbines. Vessels of the ordinary type with ordinary engines afterward proved as weak, and the prejudice against turbines therefore passed away. This kind of propeller, however, operates most economically at high speed and can not be as easily regulated as the steam-engine. Hence a type of destroyer has been tried, the *Velox*, in which auxiliary triple-expansion steam-engines are used for moderate, the turbines alone for the maximum speed. Two third-class cruisers have been ordered also with turbines coupled in the same way with steam-engines, driven at ordinary speed by their exhaust steam.

Commerce and Production.—Of the total area of England, 76.1 per cent. is under crops and grass, 6.9 per cent. is grazing land, 5.1 per cent.

is forest, and 11.9 per cent. is bare mountain, marsh, roads, etc.; in Wales 59.3 per cent. of the land is under crops and meadow, 24.8 per cent. grazing land, 3.8 per cent. forest, and 12.1 per cent. uncultivated; in Scotland crops and grass cover 25.2 per cent., grazing heath and hills 48.4 per cent., woods 4.5 per cent., and bare mountain, water, etc., 21.9 per cent.; in Ireland 22.9 per cent. is under crops and grass, 52 per cent. grazing, 1.5 per cent. woodland, and 23.6 per cent. waste or uncultivated. Of the total area of the United Kingdom, 37,156,000 acres are under crops and meadows, or 48.2 per cent.; 23,412,000 acres, or 30.3 per cent., consist of hills and heaths for grazing; 3,038,000 acres, or 3.9 per cent., are woodland; and 13,504,000 acres, or 17.6 per cent., are uncultivated. In 1901 there were in Great Britain 7,133,708 acres under grain, 3,129,198 acres under green crops, 51,127 acres under hops, 672 acres under flax, 74,999 acres planted to small fruits, 344,105 acres of bare fallow, 4,856,387 acres in clover and hay crops, and 16,827,249 acres of permanent pasture. In Ireland there were 1,317,590 acres of grain, 1,079,429 acres of green crops, 55,471 acres of flax, 10,967 acres of bare fallow, 1,233,699 acres of clover and grass, and 11,522,700 acres of pasture. The area of wheat was 1,700,828 acres in Great Britain and 53,821 acres in Ireland; of barley, 1,972,448 acres in Great Britain and 174,173 acres in Ireland; of oats, 2,996,902 acres in Great Britain and 1,105,050 acres in Ireland; of turnips, 1,664,525 acres in Great Britain and 297,859 acres in Ireland; of potatoes, 577,260 acres in Great Britain and 654,079 acres in Ireland; of beans, 251,613 acres in Great Britain and 2,297 acres in Ireland; of peas, 155,130 acres in Great Britain and 441 acres in Ireland, for 1901 and 1900 respectively. The crop of wheat was 52,458,000 bushels in Great Britain and 1,682,000 bushels in Ireland; of barley, 61,108,000 bushels in Great Britain and 6,231,000 bushels in Ireland; of oats, 110,106,000 bushels in Great Britain and 50,290,000 bushels in Ireland; of beans, 7,388,000 bushels in Great Britain in 1900 and 81,000 bushels in Ireland; of peas, 4,061,000 bushels in Great Britain in 1900 and 11,000 bushels in Ireland; of potatoes, 2,735,000 bushels in Great Britain in 1900 and 1,842,000 bushels in Ireland; of turnips, 23,960,000 bushels in Great Britain in 1900 and 4,226,000 bushels in Ireland.

The live stock in Great Britain in 1901 comprised 1,511,431 horses, 6,763,894 cattle, 26,377,200 sheep, and 2,179,925 hogs; in Ireland, 491,380 horses, 4,672,035 cattle, 4,378,645 sheep, and 1,219,046 hogs. There were 786,939 tons of fish, valued at £9,044,502, landed on the British and Irish coasts during 1901, and the value of shell-fish raises the total value to £9,492,379. The number of registered fishing-boats in 1899 was 26,466, and the number of men engaged in sea fishing was 109,015, of whom 40,472 were English, 38,177 Scotch, and 28,541 Irish. The quantity of fish conveyed inland from the ports in 1900 was 516,613 tons for the United Kingdom, 385,694 tons in England and Wales, 115,104 tons in Scotland, and 15,815 tons in Ireland. The net imports of fish were 91,880 tons, valued at £2,925,025; value of herring exported, £2,328,647; of other fish, £666,801. The quantity of iron ore mined in the United Kingdom during 1900 was 14,028,208 tons, valued at £4,224,400, containing 4,666,942 tons of metal valued at £19,596,910; iron pyrites, 12,279 tons valued at £5,788; lead ore, 32,010 tons, valued at £349,094, containing 24,364 tons of metal valued at £418,960; tin ore, 6,800 tons, valued at £523-

604, containing 4,268 tons of metal, valued at £587,869; copper ore, 9,108 tons, valued at £34,503, containing 765 tons of metal, valued at £59,995; copper precipitate, 380 tons, valued at £2,450; zinc ore, 24,675 tons, valued at £97,606, containing 9,066 tons of metal, valued at £118,573; bog-iron ore, 4,153 tons, valued at £1,038; alum clay and shale, 7,087 tons, valued at £1,514, containing 560 tons of metal, valued at £72,800; gold ore, 20,802 tons, valued at £42,925, containing 14,004 ounces of metal, valued at £52,147; silver, 190,850 ounces, valued at £22,465; total value of minerals, £5,282,922; total value of metals extracted from British ores, £21,030,719. The quantity of coal produced in 1900 was 225,181,300 tons, value £121,652,596; clays, 14,040,694 tons, value £1,571,043; sandstone, 5,019,874 tons, value £1,586,045; slate, 585,859 tons, value £1,528,336; limestone, 11,905,477 tons, value £1,300,314; salt, 1,861,347 tons, value £611,920; oil shale, 2,282,221 tons, value £627,844; granite, 4,634,301 tons, value £1,238,747; chalk, 4,373,331 tons, value £208,032; gravel and sand, 1,837,202 tons, value £138,163; gypsum, 208,038 tons, value £69,642; arsenic and pyrites, 13,654 tons, value £75,738; barytes, 29,456 tons, value £29,244; ochre, 15,200 tons, value £13,398; value of other minerals £23,692; total non-metallic minerals, 130,674,754 tons, value £135,957,676. Of the total mineral product the value of £93,722,160 was mined in England, £21,736,719 in Wales, £20,198,599 in Scotland, and £239,840 in Ireland. The total number of persons employed in mining was 814,517, of whom 780,052 worked in 3,384 coal-mines and 34,465 in 764 metalliferous mines. In quarries 93,895 persons were employed. The exportation of coal in 1900 was 46,098,228 tons, value £38,619,856. Of the exports of coal and coke, 8,635,030 tons went to France, 5,336,157 tons to Italy, 5,985,161 tons to Germany, 3,229,294 tons to Russia, 3,048,458 tons to Sweden, 2,619,681 tons to Spain, 1,125,493 tons to Denmark, 1,971,121 tons to Egypt, 1,901,550 tons to the Netherlands, 1,436,958 tons to Norway, 1,191,649 tons to Belgium, and smaller quantities to Brazil, the Argentine Republic, Portugal, and Algeria. The importation of iron ore in 1900 was 6,297,963 tons, valued at £5,639,003; exportation, 3,414 tons, valued at £7,461. Of the iron ore imported, 5,551,559 tons came from Spain, value £4,914,239. The total net supply available for smelting in 1900 was 20,873,670 tons. The quantity smelted in 403 furnaces was 22,100,774 tons. The quantity of pig iron made was 8,959,691 tons. Imports of pig and puddled iron were 181,151 tons, and exports 1,427,525 tons; exports of bar and angle iron, 157,164 tons; of railroad iron, 463,731 tons; of wire, 38,441 tons; of plates for tinning, 66,278 tons; of tin plates, 272,877 tons; of cast and wrought iron, 338,637 tons; of hoops and plates, 331,957 tons; of old iron, 93,937 tons; of unwrought steel, 308,448 tons; of iron and steel, 41,694 tons; total, 3,540,689 tons. The importation of copper ore and regulus was 188,492 tons; of unmanufactured copper, 78,643 tons; of lead, 195,380 tons; of tin, 33,118 tons; of zinc, 69,536 tons. The quantity of raw cotton imported into the United Kingdom in 1901 was 1,830,305,904 pounds; exports, 206,566,976 pounds; retained for consumption, 1,623,738,928 pounds. The imports of wool in 1900 were 558,950,528 pounds; exports, 196,207,261 pounds; retained for consumption, 362,743,267 pounds. Of the wool imports 386,387,117 pounds came from Australia. The imports in 1901 were 696,000,000 pounds, in addition to which 30,000,000 pounds were clipped from imported sheepskins, 20,000,000

pounds of goats' hair were imported, and 67,000,000 pounds of woollen rags, and 138,000,000 pounds of wool were produced in the United Kingdom, making the total supply 951,000,000 pounds, less 293,000,000 pounds of foreign and 20,000,000 pounds of domestic wool exported, leaving for consumption 638,000,000 pounds. Imports of cotton in 1901 were 1,830,000,000 pounds, and exports 206,000,000 pounds, leaving for consumption 1,624,000,000 pounds; actual consumption, 1,647,000,000 pounds. The imports of flax were 160,000,000 pounds, the home product 18,000,000 pounds, and the exports 3,000,000 pounds, leaving for consumption 175,000,000 pounds. The exports of cotton piece goods in 1901 were 5,365,000,000 yards; of cotton yarn, 170,000,000 pounds; of woollen piece goods, 157,000,000 yards; of woollen yarn, 48,000,000 pounds; of linen piece goods, 150,000,000 yards; of linen yarn, 13,000,000 pounds; value of cotton manufactures exported, £73,700,000; of woollen manufactures, £19,500,000; of linen manufactures, £5,800,000; total textile manufactures, £99,000,000.

The total value of imports of merchandise into the United Kingdom in 1901 was £522,238,986; exports of British products, £280,498,889; exports of foreign and colonial products, £87,846,843. In 1900 the merchandise imports were £523,075,163 in value; exports of British products, £291,191,996; exports of foreign and colonial products, £63,181,758. Of the total imports, England and Wales received £472,370,000, Scotland £38,691,000, and Ireland £12,015,000. Of the exports, England and Wales exported £258,681,000 British and £61,475,000 foreign, Scotland £32,167,000 British and £738,000 foreign, and Ireland £344,000 British and £968,000 foreign. The share of England in the total trade was 90.3 per cent., the share of Scotland 8.2 per cent., and that of Ireland 1.5 per cent. The imports of live animals for food in 1901 were £9,400,033 in value; of articles of food and drink free of duty, £162,949,666; of dutiable articles of food and drink, £47,505,501; of tobacco, £4,819,473; of metals, £30,787,452; of chemicals, dyes, and tanning substances, £6,129,559; of oils, £11,030,606; of textile materials, £79,401,772; of materials for various manufactures, £57,954,510; of manufactured articles, £93,609,754; of miscellaneous articles, £17,298,198; by parcel post, £1,262,462. The quantity of imports of bacon and hams retained for home consumption in 1900 was 19,620,000 pounds; of fresh mutton, 9,280,000 pounds; of butter, 9,110,000 pounds; of cheese, 7,260,000 pounds; of eggs, 49,480,000 in number; of wheat and flour, 245,240,000 pounds; of potatoes, 24,130,000 pounds; of sugar, 87,710,000 pounds; of tea, 6,110,000 pounds; of rice, 10,200,000 pounds; of tobacco, 1,960,000 pounds. The imports of wheat in 1901 were 16,296,220 quarters, against 16,044,270 quarters in 1900. The imports of cereals and flour were 196,388,807 hundredweight; of potatoes, 7,076,882 hundredweight; of rice, 6,757,323 hundredweight; of bacon and hams, 7,633,018 hundredweight; of fish, 2,301,315 hundredweight; of refined sugar, 21,591,051 hundredweight; of raw sugar, 13,419,775 hundredweight; of tea for consumption, 255,873,087 pounds; of butter, 3,702,810 hundredweight; of margarine, 960,082 hundredweight; of cheese, 2,586,885 hundredweight; of beef, 4,715,260 hundredweight; of preserved meat, 769,364 hundredweight; of fresh mutton, 3,608,229 hundredweight; of sheep and lambs, 381,481 in number; of cattle, 494,225 in number; of eggs, 17,072,795 great hundreds; of spirits for consumption, 8,837,185 proof gallons; of wine for consumption, 15,280,576 gal-

lons. Of the wheat imports in 1901 British possessions furnished 18,859,010 hundredweight, including 6,896,710 hundredweight from Canada, 6,820,800 hundredweight from Australasia, and 3,341,500 hundredweight from India, and 52,888,820 hundredweight came from foreign countries, of which the United States supplied 40,466,300 hundredweight, the Argentine Republic 8,080,000 hundredweight, Russia 2,541,500 hundredweight, Germany 594,700 hundredweight, Roumania 512,100 hundredweight, Turkey 440,700 hundredweight, and other countries 253,120 hundredweight. Of the tea imports in 1900 India supplied 51.38 per cent., Ceylon 38.30 per cent., China 7.13 per cent., the Netherlands 2.21 per cent., and other countries 0.98 per cent. The value of cereals and flour imported in 1901 for domestic consumption was £61,241,027; of raw cotton, £41,985,174; of meat, £39,987,806; of lumber and wood, £24,558,862; of butter and margarine, £21,853,687; of wool, £21,503,960; of sugar, raw and refined, £19,507,037; of silk manufactures, £13,025,204; of woolen manufactures and yarn, £11,894,552; of flax, hemp, and jute, £11,620,420; of oils, £11,030,606; of tea, £9,487,793; of animals for food, £9,400,033; of dressed hides and leather, £8,318,910; of fruit and hops, £8,082,568; of seeds, £7,872,858; of cheese, £6,227,277; of chemicals, dyestuffs, and tans, £6,129,559; of eggs, £5,495,776; of iron manufactures, £5,104,502; of wine, £4,937,343; of copper ore, £4,920,800; of tobacco, £4,819,473; of copper, £4,733,686; of iron ore, £4,551,429; of tin, £4,215,645; of machinery, £3,962,068; of coffee, £3,044,404; of lead, £2,843,996; of currants and raisins, £1,925,051; of zinc and zinc manufactures, £1,667,068; of pig, puddled, and bar iron, £1,527,573; of unwrought steel, £1,106,364. The value of cotton fabrics exported in 1900 was £65,712,756, and of cotton yarn £7,977,330; total cotton manufactures, £73,690,086. The value of woolen fabrics was £14,255,293, and of woolen and worsted yarn £5,238,638; total, £19,494,931. The value of linen fabrics was £5,012,834; of linen yarn, £824,900; of jute fabrics, £2,213,078; of jute yarn, £514,378; of apparel and haberdashery, £7,056,925. The value of pig iron was £2,631,746; of bar, bolt, angle, and rod iron, £1,041,367; of railroad iron, £3,654,421; of wire, £967,132; of tin plates, £3,706,958; of hoops, sheets, and plates, £3,949,218; of cast and wrought iron, £5,043,795; of old iron, £274,194; of steel and manufactures of steel or steel and iron, £4,036,842; total iron and steel, £25,305,673. The value of new ships sold abroad was £9,159,876. The exports of hardware and cutlery were £2,079,087 in value; of copper, £3,512,947; of machinery, £17,855,335; of coal, cinders, and patent fuel, £30,336,582; of chemicals, £8,942,109. The values of imports of merchandise from and of exports of British and Irish produce to the different British possessions in 1900 are here given:

BRITISH POSSESSIONS.	Imports.	Exports.
Australasia	£26,434,421	£27,068,158
India	27,269,106	30,115,788
British North America	22,940,886	8,196,710
South and East Africa	4,122,425	12,965,449
Straits Settlements	7,085,099	3,180,199
Ceylon	5,473,111	1,882,876
West Africa	2,187,088	2,146,149
Hong-Kong	1,086,046	2,782,892
British West Indies	1,670,806	1,771,860
Channel Islands	1,478,978	981,621
Malta	74,717	1,118,694
British Guiana	600,114	696,989
Mauritius	292,566	277,174
All other possessions	568,566	1,767,058
Total	£108,880,626	£294,379,586

The imports of merchandise from various foreign countries in 1900 and the exports to them of British and Irish produce were valued as follows:

COUNTRIES.	Imports.	Exports.
United States	101	£19,780,881
France	96	19,677,913
Germany	87	27,990,718
Netherlands	88	10,937,401
Belgium	98	10,773,703
Russia	88	11,001,800
Spain	106	2,885,594
Argentine Republic	106	7,148,786
Egypt	178	6,000,409
Denmark	87	4,268,586
Sweden	100	5,421,746
Chile	87	6,254,746
Brazil	107	5,880,258
Italy	90	8,778,114
Japan	105	8,775,188
Turkey	107	3,015,458
Norway	119	2,527,062
China	100	5,574,147
Portugal	107	2,065,570
Austria-Hungary	105	2,516,889
Greece	119	1,054,861
Philippine Islands	101	1,148,886
Java	104	2,547,406
West Africa	105	1,988,566
Mexico	84	1,298,503
Peru	104	948,827
Uruguay	101	1,680,861
Roumania	100	568,179
Canary Islands	106	919,496
Central America	106	908,998
Algeria	102	871,187
Morocco	101	575,588
East Africa	96	708,513
Venezuela	104	564,861
Colombia	106	344,886
Peru	104	948,827
Ecuador	107	286,579
Tunis	101	265,068
Haiti and Santo Domingo	106	287,198
Siam	106	301,541
Indo-China	107	68,708
Bulgaria	170	126,818
Madagascar	79	37,816
All other countries	100	2,365,270
Total	£412,544,588	£196,812,400

The value of merchandise transhipped in transit in 1900 was £11,016,516. The imports of gold coin and bullion in 1901 were £20,715,628, and exports £13,965,265; imports of silver coin and bullion were £11,501,678 in value, and exports £12,049,837.

Navigation.—The total number of vessels entered at the ports of the United Kingdom during 1900 was 363,462, of 105,051,375 tons; the total number cleared was 348,179, of 103,726,553 tons. These numbers include 284,908, of 55,828,569 tons, entered and 280,037, of 54,425,666 tons, cleared coastwise. The tonnage of vessels engaged in foreign trade entered at British and Irish ports in 1900 was 49,223,000 tons, of which 31,445,000 tons were British and 17,777,000 tons were foreign; cleared in the foreign trade, 49,301,000 tons, of which 31,266,000 tons were British and 18,035,000 tons foreign. The tonnage of vessels entered with cargoes from foreign ports was 36,186,000 tons, of which 24,426,000 tons were British and 11,760,000 tons were foreign; cleared with cargoes, 43,672,000 tons, of which 21,906,000 tons were British and 15,766,000 tons foreign, total tonnage entered and cleared with cargoes, 79,858,000 tons, of which 52,332,000 tons were British and 27,526,000 tons foreign. With cargoes and in ballast the total foreign tonnage entered was 35,812,857 tons, of which 7,661,571 tons were Norwegian, 8,027,208 tons German, 3,597,198 tons Swedish, 3,494,797 tons Danish, 3,213,767 tons Dutch, 2,822,375 tons French, 2,709,247 tons Spanish, 1,601,606 tons Belgian, 1,419,078 tons Italian, 1,179,497 tons Russian, 559,552 tons

American, and 491,222 tons Austrian. The tonnage entered and cleared at the principal ports of the United Kingdom was as follows: London, 16,700,527; Cardiff, 12,769,240; Liverpool, 11,677,708; Tyne ports, 8,791,299; Hull, 4,940,735; Glasgow, 3,681,597; Southampton, 3,009,389; Newport, 2,603,451; Blyth, 2,487,217; Swansea, 2,446,051; Kirkcaldy, 2,039,433; Leith, 2,037,600; Middlesbrough, 1,978,286; Sunderland, 1,959,932; Dover, 1,937,550; Grimsby, 1,891,474; Grangemouth, 1,728,641; Manchester, 1,383,254; Harwich, 1,366,021; Goole, 1,170,604; Bristol, 1,121,245; Hartlepool, 999,036; Folkestone, 777,813; Belfast, 685,750.

The British registered shipping at the beginning of 1901 comprised 10,773 sailing vessels, of 2,096,498 tons, and 9,209 steamers, of 7,207,610 tons. There were engaged in the home and foreign trade 7,480 sailing vessels, of 1,989,731 tons, and 7,455 steamers, of 7,405,476 tons; total tonnage, 9,395,207. The total number of men employed in the commercial navy was 247,448, including 36,893 foreign sailors and 36,023 lascars. Of the total number of vessels engaged in trade 6,203 sailing, of 378,957 tons, employing 23,734 men, were in the home trade; 134 sailing vessels, of 15,936 tons, employing 719 men, were engaged both in the home trade, including ports between Brest and the Elbe, and in the foreign trade; and 1,143 sailing vessels, of 1,594,838 tons, employing 25,856 men, were engaged exclusively in the foreign trade; 3,545 steam vessels, of 508,359 tons, employing 40,288 men, were engaged in the home trade; 267 steam vessels, of 201,542 tons, employing 4,930 men, were engaged both in the home and the foreign trade; and 3,648 steam vessels, of 6,695,575 tons, were engaged exclusively in the foreign trade. The numbers of vessels built and first registered during 1900 were 504 sailing vessels, of 38,576 tons, and 667 steamers, of 698,330 tons. Besides these, 66 sailing vessels, of 7,546 tons, and 196 steam vessels, of 199,815 tons, were built for foreigners, including 20 war-vessels, of which 2, of 112 tons, were sailing vessels and 18, of 11,630 tons, were steamers. The total number of vessels belonging to the United Kingdom was 19,982, of 9,304,108 tons. The total number belonging to the British Empire in 1900 was 34,875, of 10,751,392 tons, the sailing tonnage being 3,011,594 and steam tonnage 7,739,798 tons.

Shipping Trust.—In the spring of 1902 a trust of British and American lines of steamships engaged in the north Atlantic shipping trade was formed with American and British capital amounting to \$170,000,000. The company, which acquired a majority of the stock of the British lines and entered into an agreement for the division of traffic and establishment of equal rates with the two great German lines, was domiciled in New York, but the British ships retained their nationality, and the obligation to serve England as auxiliary naval vessels in case of war that had been assumed for some of them was not canceled. For some years previous to the combination the steamships engaged in passenger transportation between American and European ports had in competition provided more and more luxurious accommodation, and freight rates had declined, owing to the extraordinary activity in ship-building which began in 1898 after a period of quiescence and continued till the close of 1901. Dividends and profits shrank or ceased in consequence of the competition, so that Englishmen largely interested in shipping were willing to enter or sell out to the trust formed to keep up rates and reduce expenses by J. P. Morgan. British lines which did not enter the

American combination formed an alliance among themselves and sought subsidies from the British and Canadian governments to enable them to compete with the other syndicate and develop trade with Canada and with the East through Canada. The Australian Government was asked also to assist an all-British combination that would promote commerce between the different parts of the British Empire. In the United States the American syndicate controlled railroads and various facilities that gave it an advantage over the rival combination.

Railroads, Posts, and Telegraphs.—The total length of railroads open to traffic in the United Kingdom on Jan. 1, 1901, was 21,885 miles, of which 15,187 miles were in England and Wales, 3,485 miles in Scotland, and 3,183 miles in Ireland. The total share and loan capital was £1,176,001,890. The number of passengers conveyed in 1900 was 1,142,276,686, paying £45,383,988; freight receipts, £53,470,564; total gross earnings, £104,801,858. The capital of English railroads was £970,147,581, and receipts were £89,392,501; the capital of Scottish railroads was £166,088,736, and receipts were £11,603,010; the capital of Irish railroads was £39,765,573, and receipts were £3,806,347. The total operating expenses were 64,743,520, being 62 per cent. of the gross earnings. The length of street-railroads in the United Kingdom on July 1, 1900, was 1,177 miles; the capital expenditure was £20,582,692; receipts for the previous year, £5,445,620; expenses, £4,075,352; net earnings, £1,370,277; number of passengers carried, 1,065,374,347.

The post-office in 1901 delivered 1,970,000,000 letters in England and Wales, 202,400,000 in Scotland, and 144,200,000 in Ireland; total, 2,323,600,000. The number of postal cards was 359,400,000 in England and Wales, 41,600,000 in Scotland, and 18,000,000 in Ireland; total, 419,000,000. The number of book packets was 619,300,000 in England and Wales, 77,800,000 in Scotland, and 35,300,000 in Ireland; total, 732,400,000. The number of newspapers was 127,800,000 in England and Wales, 19,300,000 in Scotland, and 20,700,000 in Ireland; total, 167,800,000. The number of parcels was 67,200,000 in England and Wales, 8,600,000 in Scotland, and 5,200,000 in Ireland; total, 81,000,000. The total number of inland money-orders was 11,375,518, for £34,454,859, of which 9,638,474, for £29,213,745, were issued in England and Wales, 1,094,431, for £3,344,601, in Scotland, and 642,613, for £1,896,423, in Ireland. The total number of postal orders was 85,390,029; total amount, £29,881,726. The British postal authorities, having in vain endeavored to establish a parcel post with the United States by agreement with the Post-Office Department at Washington, although such a service has been in operation between Great Britain and British colonies since 1885, arranged with a private corporation, the American Express Company, to deliver anywhere in the United States and receive for delivery by the British post-office in the United Kingdom parcels under 3 pounds for 2s. or 50 cents, from that to 7 pounds for 3s. or 75 cents, from 7 to 11 pounds for 4s. or \$1. For New York and adjoining cities the rates are 1s. or 25 cents, 2s. or 50 cents, and 3s. or 75 cents, but for all parcels entering the United States an additional charge of 25 cents goes to the Government for clearance at the custom-house besides import duties at regular rates, and another fee of 25 cents to the custom-house broker.

The British postal telegraphs on March 31, 1901, had a total length of 46,295 miles, with

347,680 miles of wire. The number of messages sent in the year ending March 31, 1901, was 89,576,961, of which 75,384,867 were despatched in England and Wales, 9,289,019 in Scotland, and 4,903,075 in Ireland.

There were 76,831 miles of telephone-lines belonging to the Government on March 31, 1901, and 7,700 miles were under construction. The number of conversations during the previous year was 17,950,296. The post-office had contracted for the construction of 34,356 miles more. The National Telephone Company had 1,019 exchanges, and the number of conversations over its wires was 723,246,368. The net receipts of the post-office from postal traffic in 1901 were £13,995,470, and expenses £10,064,903; telegraph receipts were £3,459,353, and expenses £3,812,569; net deficit, £353,216, not counting £298,888 of interest on the purchase price, net postal and telegraph revenue, £3,557,351.

The demand for all-British cable communications with colonies and naval stations in all parts of the world, which was based on strategic considerations, led to the Pacific cable which was laid between Canada and Australia in 1902. British lines connect Australia, Cape Colony, and Canada with the British Islands, and one has lately been laid between Cape Colony and Australia. A committee appointed to consider the cable communications of the British Empire considered it desirable that every important colony or naval base should have one cable to England which touches only on British territory or the territory of a friendly neutral, and also desirable that there should be as many alternative routes as possible. An all-British line is not so safe and sure in war as one touching the territory of a friendly neutral, since cables are most vulnerable in territorial waters, and the presumption is that in a war with a naval power a large proportion of the all-British lines would be cut. The free development of commercial lines is therefore of greater strategical importance than state-owned all-British cables that would check such development.

The Parliamentary Session.—The second session of the first Parliament of Edward VII was opened by the King in person on Jan. 16, 1902. In the speech from the throne operations in South Africa were said to have been favorable to British arms, the area of the war largely reduced, industries resumed in the new colonies, the soldiers cheerful in the endurance of hardships incident to guerrilla warfare and humane to their own detriment, and the colonies loyally offering further contingents, shortly to arrive in South Africa from Canada, Australia, and New Zealand. The Brussels international conference on sugar bounties was expected to lead to their abolition and the consequent relief of the sugar-producing colonies and home manufacturers of sugar. The canal treaty with the United States was designed to facilitate the construction of an interoceanic canal under guarantees that its neutrality will be maintained and that it will be open to the commerce and shipping of all nations. A treaty with Brazil provided for the delimitation of the frontier between British Guiana and Brazil by the King of Italy. A rainfall still deficient in India necessitated the continuance of relief, though on a less extensive scale, in parts of Bombay and adjoining native states, and in future famine relief would be improved in method and efficiency as a result of the commission that had investigated the subject. The new Ameer of Afghanistan was desirous of maintaining the friendly relations of his country with the Indian Em-

pire. The legislative program embraced proposals for the coordination and improvement of primary and secondary education, for administering the water-supply of London, for facilitating the sale and purchase of land in Ireland, for improving the law of valuation, for amending the law relating to the sale of intoxicating liquors and for the registration of clubs, for amending the patent law, and for reforms in the law of lunacy.

The proposal to impose a duty on imported grain and flour, which the Chancellor of the Exchequer described as too slight to be protective or to affect the price of bread, was carried by a vote of 254 to 135, and Sir William Harcourt's amendment proposing to reject the duty was rejected by a majority of 296 to 188. A loan of £30,000,000 was only opposed by 49 Nationalists and Radicals. The previous loan of £32,000,000 was issued at 93½ and the lowest price for the 2½-per-cent. consols, which will pay only 2½ per cent. after April, 1903, was 91 during the war. Sir Michael Hicks-Beach did not alter his financial calculations after the close of the war except in regard to further borrowings. He added to the estimate £750,000 for the South African constabulary, £750,000 for interest on new debt, and £250,000 for a grant to the West Indies, making the total expenditure £176,359,000. The deficit of £19,500,000 would be paid out of the loan, and at the end of the year the remainder of the loan could be returned to pay off debt and the sinking-fund, suspended during the war, be restored.

New rules of procedure were introduced early in the session. Some of these were opposed by the whole Liberal party and with all means of resistance in their power by Irish Nationalists and Radicals. The discussion took up a great part of the session. Though the house sat through whole nights and the Government applied the closure freely, slow progress was made. Under the rules that were adopted questions of privilege are referred to a committee; a motion for adjournment, the favorite weapon of a minority bent on hindering the advancement of a Government measure, can not be debated until the hours reserved to the Government have passed; the time reserved for questions is limited to the first hour on Friday and the last half-hour of each other sitting, unless the midnight rule has been suspended, when printed answers must suffice, but no question need be answered unless notice has been given, and the member who has given notice is alone entitled to ask the representative of the Government to explain his answer and must be satisfied with one explanation; the Government can continue debate after the appointed hour for the close of each afternoon and evening sitting by moving closure, but private members can not make dilatory motions to adjourn or report progress or that the chairman leave the chair; a minister may move to have any debate resumed after midnight, otherwise the evening sitting terminates one hour after midnight, on Fridays at six o'clock in the afternoon, but discussions of supply can be continued into the night by the Government without the concurrence of the house; the speaker has power in case of gross disorder to suspend any sitting for a time to be named by him; the first twenty-five minutes of Government days and the sitting of Friday, from twelve till six o'clock, are the only times allowed for private bills, petitions, and motions, except two evening sittings before and one only after the Easter recess, when notices of motion take precedence, but after Whitsuntide all the evenings and all the Fridays save two belong

also to the Government; the estimates must be voted before Aug. 5, and their discussion must not occupy more than twenty days, the closure being applied to carry in a lump without discussion all items not yet voted, unless a minister asks and the house allows three days more, and any vote on account must be disposed of in one day; when a member is named by the speaker or the chairman of committees for disregarding his authority or for abusing the rules for purposes of obstruction or for other reasons he can, on a simple motion put without debate, be suspended for twenty sitting days for the first, forty days for the second, and eighty days for the third or any subsequent offense, and the suspended member can not resume his seat for forty days more unless he apologizes in writing, but if a member or members acting jointly refuse to obey the speaker so that force must be used to compel obedience he or they are suspended for the remainder of the session or for eighty days on which the house sits, whichever is the longer period; the house can not be counted out before ten o'clock in the evening, though a division when fewer than 40 members are present is not valid.

A licensing bill dealing with some of the evils arising from intemperance provides for the arrest of any person found helplessly intoxicated in a public place; makes it a punishable offense to be found drunk while in charge of a child; requires a man who has been repeatedly convicted of drunkenness to give security for his future behavior, otherwise he is confined in jail; makes it a penal offense for the keeper of a public house to sell knowingly to a habitual drunkard or an intoxicated person, and when charged with permitting drunkenness on his premises it lies with him to prove that he or persons employed by him took reasonable precautions to prevent drunkenness; provides that convictions against a licensed place be recorded for the information of the magistrates when considering the renewal of the license, and if the justices do renew a license after 5 convictions within five years they must report their reasons; places grocers' licenses, which have been freely issued on payment of £10, under the control of the licensing justices; compels all clubs in which liquor is sold to register under stringent penalties and provides for the suppression of spurious clubs established for sale of drink or other immoral purposes; enables the husband of a woman who is a habitual inebriate to apply to a court of summary jurisdiction for a judicial separation with an order for maintenance; a woman whose husband is a habitual drunkard is entitled to a protection order against him; any habitual drunkard who is convicted of a crime in which drunkenness is an element can not purchase liquor without being liable to arrest and punishment, and if a publican who has been notified of the facts sells it to him he also incurs a penalty. The most important clause was that for the supervision of clubs, which must furnish particulars every year of the objects, rules, and number of members. When the membership falls below 25, when the objects and rules are not carried out in good faith, when there is much drunkenness on the premises, when persons are admitted as members without any delay, when the supply of liquor is not under the control of an officer or committee of the club, and in other suspicious circumstances, the club can be stricken from the register. Wide discretion is given to the courts to declare a club a sham.

A bill to restrict labor in coal-mines to eight hours from bank to bank, which the House of

Commons had agreed to in the previous session by a majority of 12, was rejected by a majority of 1 vote. Another bill of the mining representatives to introduce the eight-hour day in coal-mines for persons under twenty-one years of age was rejected by 66 votes, it being coupled with the proposal, which the authors wished too late to withdraw, that no one should be employed underground who had not entered the mines before he was eighteen. The highest court having decided that trade-unions can be sued on account of any injury they may inflict, their representatives moved to relieve them of this liability, which was intended to be fastened on them, in the act permitting their incorporation. The Government considered their liability to be sued and the correlative right to sue equitable, and yet could muster no greater majority than 29 to defeat the motion.

The Board of Education, instituted on April 1, 1900, has control over elementary education in England and Wales and authority to inspect secondary schools. By the elementary education act of 1870 school accommodation must be provided in every district for all children between the ages of five and fourteen. In 1900 the local authorities were empowered to allow children over twelve to leave school for a part or the whole of the year for industrial employment; in agricultural districts children over eleven were exempted during the busy season. Groups of boroughs and parishes form school districts to elect school boards, of which there are 2,545 in England and Wales, besides 788 school-attendance committees in places where there are no board schools. Parents are compelled to send their children to school by these local educational authorities. In the board schools unsectarian religious instruction is given. In the voluntary schools sectarian teaching is allowed. Voluntary schools were supported in the beginning by voluntary subscriptions. Fees were charged in the public schools until 1891, when Parliament made elementary schools free and voted an annual grant of 10s. for every child in average. In 1897 an annual grant of 5s. for each pupil was extended to voluntary schools which conformed to the standards set in the annual code of the Education Department, the central body which preceded the Board of Education. Of the associations which receive and distribute the parliamentary grant among 14,188 voluntary schools, 46 are Church of England, 11 Roman Catholic, 11 undenominational, 6 Wesleyan, and 1 Jewish. The cost of maintaining the board schools is raised by the school rates levied on all householders, while voluntary schools have to depend partly on subscribers belonging to the religious denominations which support these schools in order to give their particular doctrinal cast to the education of their children and inculcate the children of others with their religion. There were 5,758 board schools with 2,201,049 pupils, 11,777 schools of the national society of the Church of England with 1,885,802 pupils, 458 Wesleyan with 125,727 pupils, 1,045 Roman Catholic with 255,036 pupils, and 1,079 British, undenominational, etc., with 220,032 pupils. In 1901 only 91 of the schools belonging to the denominational associations declined the parliamentary fee grant which was ostensibly voted for necessitous voluntary schools.

The elementary schools of England and Wales in 1901 had accommodation for 6,610,416 pupils, 20.27 per cent. of the total population, the actual population of school age being 9,608,757, whereas in 1870 the school accommodation was sufficient

only for 8.75 per cent. of the population. There were 5,797 board schools, with accommodation for 2,881,155, having 2,703,434 scholars on the rolls and 2,239,375 in average attendance. The number of voluntary schools was 14,319, with accommodation for 3,729,261, having 3,054,709 scholars registered and 2,239,375 in actual average attendance. The number in average attendance in all the schools was 70,574 more than in 1900 and reached 82.17 per cent. of the total number on the registers. Of the total number of scholars, 5,116,384 were free and 644,275 paid fees. The schools were taught by 66,149 certificated or provisionally certificated teachers, 28,002 pupil teachers, 34,716 assistant or provisional assistant, and 17,956 additional women teachers. The number of women teachers doubled in seven years. The cost of the schools in 1901 was £3 0s. 2d. per child in average attendance in the board schools and £2 6s. 8½d. in the voluntary schools. The elementary schools have made progress under the dual system by which church schools, first independent rivals of the unsectarian public schools, have latterly been partly supported by the state and subject to inspection and examination. Intermediate education, on the other hand, has remained unorganized and has made no progress. The defects in secondary education have engaged the attention of the public and of legislators because the greater industrial and commercial progress of the United States and Germany has been ascribed in a great measure to the scientific and practical character of their systems of secondary and higher education. An educational commission in 1897 ascertained that there were in England 6,209 secondary schools in which 68,785 boarders and 207,759 day pupils were taught, a total of 276,544, of whom 122,313 were in boys', 114,239 in girls', and 21,252 boys and 18,740 girls in mixed schools. Of the total number, 5,167 were proprietary or private schools, with 152,930 pupils; 197 were schools maintained by religious and other communities and city companies, with 18,666 pupils; 308 belonged to limited liability companies, with 18,734 pupils; 619 were endowed schools founded by royal charters, acts of Parliament, etc., with 76,671 pupils; and 76 were established by local authorities, with 9,543 pupils.

Wales and Monmouth have had since 1889 a public board to examine intermediate schools, of which 94, with 7,445 pupils, were inspected in 1900. The English Board of Education when created was authorized to inspect secondary schools desiring inspection, of which there were only 27 in 1901. The education act introduced in the House of Commons by Mr. Balfour was intended to coordinate the board and voluntary schools and elementary and secondary schools and lead up to a system of national education, which is universally desiderated, which the Liberals when in power sought to develop out of the board schools, and which has made no advance on secular lines on account of the religious temper prevailing in the Church of England and dominating Tory politics. The Protestant dissenters upheld the board schools as earnestly as the Anglicans opposed them. The education act of 1897 was the first step of the English clergy toward regaining control of popular education. By their efforts and the sacrifices of their lay supporters they had built up a rival system of schools as extensive if not as efficient as the public system created and fostered by the Government and supported by rates and taxes assessed upon them as well as upon the classes whose children were educated in the board

schools, of which, indeed, they paid the larger proportion. Having obtained recognition for their schools as a branch of the national system, a public standing for them alongside of the board schools, with partial relief from their pecuniary sacrifice in the form of the 5s. grant, they now demanded an equal status and an equal share of the school rates, relieving them entirely of paying voluntary subscriptions to keep up their own schools while bearing their full share of the cost of the board schools. The non-conformists, having witnessed what the church schools had done as private institutions supported by charitable contributions, not only in competing with the board schools in education and arresting their growth as a national system of public schools, but in proselyting the people, in building up the state church while their own bodies were not increasing, regarded this proposal as a blow aimed at their religious doctrines and communities as well as at the principle of unsectarian national education. The voluntary schools were inferior in teaching staff, equipment, and buildings to the board schools, and the subscriptions that supported them were falling off, so that those more interested in the education of the people than in religious conflicts viewed with regret the inferior education that half the children received and with foreboding the prospect that this would deteriorate.

Mr. Balfour's education bill places board and voluntary schools on an equal footing, to be maintained by rates assessed by the county and borough councils. The local authority in matters pertaining to education is a committee, a majority of which must be appointed by the council and will be chosen from among its members, and the others will be persons of experience in education or acquainted with the needs of the various kinds of schools in the county or borough to be appointed also by the council, but on the nomination, where it appears desirable, of other bodies. All appointments to the educational committees are subject to the approval of the Board of Education, which has far more control and power than the central educational authority has exercised under previous acts merely by virtue of the aid granted out of the taxes and has the assistance and advice of a consultative council of experts.

In most country districts there are no schools except the church schools, and people of other denominations besides the Church of England help to support these in preference to paying rates for board schools that would be necessary if the voluntary schools went out of existence. The bill proposed that country schools, where in most cases the parish clergyman has been the only manager, should be managed by a committee composed of the clergyman, three laymen of his parish, and two representatives of the public authority. The question of the management and control of the voluntary schools was bitterly contested in the House of Commons. The clergy retained the direction of their schools in the towns, and, as it seemed to non-conformists, of the country schools as well, and this was regarded as boding a return to the age when all education was prescribed and supervised by the clergy. Non-conformist assemblies formed a solemn league and covenant to refuse to pay school rates or that part of them falling to the share of church schools, and labor organizations resolved to elect municipal bodies pledged to render the bill inoperative. The bill gives the local education authority one-third of the representation on the board of voluntary managers, but the

other two-thirds are likely to accept the control of the clergyman, and thus the one-man clerical management will be preserved. The buildings of the voluntary schools, now held by trustees for the managers, are to be handed over to the education authorities, which have power to direct what repairs or improvements shall be made by the managers and to veto any acts of the board of managers. The rate for elementary education is 2*d.* in the pound, and this can be increased wherever it is found necessary.

Not the non-conformists alone, but a considerable section of the laity of the Church of England objected to the religious instruction which the clergy who were most zealous in education insisted on giving in the parish schools, in which ecclesiastical and ritualistic ideas pervade the secular studies and the children are weaned away from Protestant views of religion. The proposal to give the clergy four votes to two in the management was regarded as unfair because under the provisions of the bill not more than one-twelfth of the expenses of the schools would fall upon the owners and subscribers.

The education bill was read the second time on May 8 by the great majority of 237. As Roman Catholics are even more devoted than Anglicans to the principle of religious education, the Irish Nationalist party voted with the Government. In committee the discussion was endless. The abolition of the school boards that had developed elementary education in England was a matter for grave consideration. The uncertainty of how the county and borough councils would act and how the people would receive the certain demand for increased school rates and for rates where none were collected before caused misgivings even among the supporters of the Government, and the undefined character, composition, powers, and functions of the educational committees made the prospect still more obscure. Under the previous education laws no board schools could be erected in districts sufficiently provided with voluntary schools, but where there was insufficient accommodation for all the children in a district the Board of Education was enjoined to call upon the district to supply the deficiency and had power to enforce its demand. Board schools have been erected wherever denominational schools did not exist and children of Church of England parents attended them, just as children of non-conformists attended Church schools where these held the field. Under the new bill the local educational authorities will not be permitted to erect new schools if persons are willing to build voluntary schools. There were optional clauses in Mr. Balfour's bill that were generally condemned. The town councils were not compelled to assume authority over education, and if they did not the elective school boards retained their functions. It was optional also for the local education authority to appoint 2 additional managers to the voluntary school committees or to leave the 4 private managers in unrestricted control. The secular education in these schools is under the control of the local educational authority, which can veto the appointment or dismissal of any teacher. The guiding principle of the bill was that there shall be one local authority for elementary, secondary, and technical education within each county or borough, and that this shall be the rating authority, which shall have at its disposal the best local expert assistance. The bill provides that the local education authorities shall consider the needs not only of elementary education, but shall take such steps

as seem desirable, after consultation with the Board of Education, to supply or aid in the supply of education other than elementary, including the training of teachers and the general co-ordination of all forms of education. The power that the bill gives them is the optional one of levying a rate of 1*d.* in the pound for secondary education in addition to the 1*d.* they can already levy for technical education, and the money raised by this 2*d.* rate, together with the local taxation fund received from the Government, may be divided as they see fit between secondary, normal, technical, scientific, and evening schools. London was excluded from the operation of the bill.

On July 11 the Marquis of Salisbury tendered his resignation as Prime Minister. The King on the following day offered the post to Mr. Balfour. Sir Michael Hicks-Beach, Lord Cadogan, and Lord James also retired. The Cabinet was reconstituted on Aug. 8 as follows: Prime Minister, First Lord of the Treasury, and Lord Privy Seal, Arthur Balfour; Lord High Chancellor, Lord Halsbury; Lord President of the Council, the Duke of Devonshire; Secretary of State for Foreign Affairs, the Marquis of Lansdowne; Home Secretary, A. Akers-Douglas; Colonial Secretary, Joseph Chamberlain; Secretary of State for War, W. St. John F. Brodrick; Secretary of State for India, Lord George Hamilton; First Lord of the Admiralty, the Earl of Selborne; Chancellor of the Exchequer, C. T. Ritchie; Lord Chancellor of Ireland, Lord Ashbourne; Chief Secretary for Ireland, George Wyndham; Secretary for Scotland, Lord Balfour of Burleigh; President of the Board of Trade, Gerald Balfour; President of the Local Government Board, Walter H. Long; President of the Board of Agriculture, R. W. Hanbury; President of the Board of Education, the Marquis of Londonderry; Postmaster-General, J. Austen Chamberlain. The Secretary for Ireland went into the Cabinet instead of the new Lord Lieutenant, the Earl of Dudley. Sir William H. Wairond, who was appointed Chancellor of the Duchy of Lancaster, did not receive a seat in the Cabinet, nor Lord Windsor, the First Commissioner of Works, but the new Postmaster-General did and the President of the Board of Education. Serious trouble in Ireland was the reason for making the Chief Secretary a Cabinet minister once more.

An intended visit of the King to Dublin was given up in consequence of the excited state of the country and of pro-Boer demonstrations in Parliament of the Irish members. The Congested Districts Board having reduced rents by one-third on one estate it had acquired in County Roscommon for resale to tenants, the Land League upheld the tenants on the neighboring estates in their determination to pay only on the same scale. The estate purchased by the board was the vast estate of Lord Dillon, an absentee landlord. The instalments were fixed at a far lower figure than the judicial rents on the adjoining Murphy and De Freyne estates, but the tenants would not complete the purchase unless they could have the shooting and fishing rights. Evictions followed on the estate of Lord De Freyne, and these were attended with violence on the spot and stirred the passions of the Irish people as of old. In other counties of the west and south there were complaints of rackrenting. In Connaught, where the disaffection arose because the Government refused to readjust rents that were much higher than the annual payments of purchase money asked for the same kind of land, the peasants earned the £4 or £5 rent for their little holdings by going to the better districts of

Ireland or to England to work as laborers in the summer time. The United Irish League, which succeeded the Land League, became active and the Home Rulers in Parliament aggressive. Lord Cadogan in April, under the crimes act of 1887, revived in 9 counties the summary jurisdiction of stipendiary magistrates, special juries, and change of venue. Convictions under the coercion act were innumerable. When the Irish members went home in the parliamentary recess they took the lead in the attack on the Government, and were brought one after another before the resident magistrates for conspiracy until ten were convicted without juries and sentenced to various terms of imprisonment. For the first time hard labor was added to the punishment and they were treated as common criminals. Mr. Wyndham's land bill was intended for the mutual benefit of landlords and tenants. Its aim was to accelerate the transfer of the land to the latter, and hence contained a clause providing that in future the land courts would not reduce rents unless the tenant agrees to a purchase option. The Irish members considered if a landlord's bill, yet the landlords looked with apprehension upon a clause which gave the land commissioners power to fix prices as well as rents. Sales under the previous land bill decreased rapidly in four years, while fixing of rents has become more involved and expensive. Litigation flourishes while the land is going to decay and the landlords can not sell for enough to clear off encumbrances. The bill, which had no chance of passing unless both the landlords and the Irish members accepted it, would enable a landlord desirous of selling to apply to the Land Commission to fix a price, and if he accept it and three-quarters of the tenants agree to purchase, the commission advances the money and divides the land among the tenantry, to be paid for in instalments, reselling, if desired, the immediate demesne to the landlord. Lands overcrowded with tenants, with holdings less than 10 acres rated at less than £5 a year, lands where tenants cultivated patches in different places, and mountain and bog lands Mr. Wyndham proposed to treat as congested districts and to buy and re-appportion the land at a loss to the Government. When tenants on an estate apply to have a fair rent fixed the Land Commission would value the estate, if the owner is willing to sell, and if the tenants are unwilling to purchase with the aid of Government advances they must continue to pay the rent they have been paying for fifteen years longer and are charged with the costs. Mr. Wyndham, who had endeavored to follow Gerald Balfour's policy of killing Home Rule with kindness, refrained from proclaiming the Land League a dangerous association and attempting to suppress it with the powers the crimes act gave, which no Government had attempted to apply to their full extent, was constrained to proclaim more districts when Ireland was inflamed by the Nationalist orators more widely than ever was known, even in Leinster and Munster. In September he made Dublin one of the proclaimed districts and prohibited public meetings in that city, not because any violence occurred there, but because that was the headquarters of the agitation and, unless he grasped the despotic powers of coercion, the inviolable asylum of the agitators. Although the land courts had twice reduced rents, there was much distress in the western and southern counties, of which the confusion and litigation arising from the land laws was a contributory cause. The purchase clauses had failed because the ma-

jority of the gentry were as loath to give up their ancestral estates as the peasantry were to leave their bit of land, even when landlord and tenant were both insolvent and plunging deeper into debt. Some of the landlords proposed a conference for the settlement of the land question by agreement with the tenants and their advocates. The Chief Secretary approved the suggestion of a mutual agreement without committing himself in regard to the unexplained basis of the settlement. Ireland has long been paying an unequal share of the imperial taxes, the amount of the excess having been estimated in the report of the commission on financial relations. The Irish of all parties have demanded a readjustment of taxation and are not satisfied with the reply that Ireland has a proportionately larger representation in Parliament. The hundreds of millions that Ireland has inequitably been made to contribute to the imperial treasury beyond her true share seems to the Irish a debt due from Great Britain which ought to be repaid in some way. In the parts of Ireland where agrarian troubles are chronic, though rents are reduced every fifteen years, bankrupting the owners of the encumbered estates, yet the tenants are still impoverished, and the land, left undrained, unfertilized, stripped of its trees, is constantly deteriorating. Representatives and friends of the debt-ridden landlords thought that the British Government, through whose interference they had become financially ruined, should make them whole by buying their estates at the former renting value and place the peasants on a safe financial footing by reselling the land to them at its actual productive value. On such a basis most of the landlords would agree to compulsory sale, but not the great proprietors like the Duke of Abercorn and the Marquis of Londonderry. The Irish Nationalist party was unanimous in demanding the compulsory expropriation of the landlords in whatever way and the creation of a proprietary peasantry on terms fair to the peasants. The evictions on the De Freyne estate were carried out. The Land Leaguers prevented the vacant farms from being taken for grazing purposes and broke up the practise of shopkeepers in many Irish towns who made a profitable speculation in renting grass lands each year to fatten stock for market. Some of the landlords met in a convention and raised a fund to assist and protect persons attacked or threatened by boycotting, blackmailing, or intimidation. The law of conspiracy under a new interpretation brought to prison many speakers who threatened to make those who opposed them uncomfortable and miserable even by means which they themselves considered moral and lawful. Col. Arthur Lynch, who commanded an Irish legion that fought on the side of the Boers in South Africa, was elected to Parliament in Galway when the war ended. As soon as he landed on British soil he was arrested on the charge of high treason. Boycotting in the form of exclusive dealing with shopkeepers in towns and with others who did not join the United Irish League was the principal ground on which members of Parliament and of the county and borough councils were sentenced for criminal conspiracy to imprisonment with hard labor, which deprives them of civil rights for five years. Most of the newspapers of the country were suppressed for printing lists of those who had joined the league and those who had not. The civil court in Dublin gave damages, which a special jury fixed at a high figure, to a small trader who sued several members of the United Irish League for ruining his business

because he had taken a vacant farm. The Chief Secretary endeavored to bring about a conference between representatives of the landlords' convention and of the United Irish League respectively with a view to settling the general terms on which the land could be transferred to the farmers. The landlords refused to take part in such a conference. In the sales which the Land Commission had effected the instalments paid annually were 4 per cent., extinguishing the debt in from forty to fifty years, but the purchaser was required to pay at once 25 per cent. of the purchase money in cash. The instalments were considerably lower than the rents. The tenants were willing to pay eighteen years' purchase, but the landlords wanted twenty-seven years' purchase.

In August Parliament adjourned for an autumn session to begin in October. The conflict over the education bill was fiercer than ever and raged fiercer yet out of doors during the recess. Of the new rules of procedure only half had been carried, and the remaining ones had little chance of going through in the face of the obstinate resistance of the Opposition. The London water bill was still in an incipient stage. The education bill was carried through the Commons by application of the closure. The Government accepted the amendment of Col. Kenyon-Slaney according to which a majority of the board of managers under a trust deed can control the religious education in a voluntary school by dismissing teachers and preventing the parson from giving instruction if it is contrary to the doctrines and usages of the Church of England. In the House of Lords the Bishop of Manchester introduced an amendment throwing upon the school rates the expense of keeping the schoolhouses in repair.

Coronation of Edward VII.—The coronation of the King was appointed to take place in June. Great preparations were made, not only by the Government in fitting up Westminster Abbey for the ceremony, in decorating the streets of London, and in arranging processions, pageants, and feasts, but by the persons who were to take part in the spectacle, and especially by the business people who provided food, raiment, and stocks of goods of many kinds, lodging-places, and stands on the route of the procession for the multitudes that would gather from the various parts of the United Kingdom, from British colonies and dependencies, and from many foreign countries. Many speculative traders who involved their capital and credit deeply secured themselves against the King's death by insuring his life. A few weeks before the appointed date the King was seized with an acute attack of perityphlitis or appendicitis. An operation was necessary which kept him confined to his bed, and in place of the festivities there was general anxiety and gloom, instead of thriving trade there was loss and stagnation in the retail business of London. The Australian Premiers, the Indian princes, the royal guests from European courts, the special envoys of foreign governments who had already arrived, with the nobility and gentry of the three kingdoms and throngs of visitors from abroad, disappeared into the country or scattered themselves over the Continent. All official plans of presentations and conferences were disarranged and missions and credentials lapsed or were abandoned. The King recovered and the coronation took place on Aug. 9 with the same ceremonial that was originally planned, but with less brilliant pomp and display and a smaller concourse of participants and

onlookers. King Edward was presented by the Archbishop of Canterbury and greeted with the homage of the people as the undoubted King of the realm, after which he swore to govern according to the statutes of Parliament and the laws and customs of the United Kingdom of Great Britain and Ireland and dominions thereto belonging; to cause law and justice to be executed in all his judgments; and to maintain the laws of God, the profession of the Gospel, the Protestant Reformed religion, the settlement of the Church of England, its doctrine, worship, discipline, and government, and the rights and privileges of the bishops and clergy. The coronation oath was followed by the ceremonies of anointing, presenting with spurs and sword, oblation of the sword, investment with the orb, cross, and ring, presentation with the scepters, the solemn crowning, enthronement on St. Edward's chair, and homage by bishops, the princes of the blood, and the orders of the peerage. Then Queen Alexandra was anointed and crowned with Queen Edith's crown and invested with the scepter and ivory rod, insignia of the Queen Consort.

A review of the Channel squadron, the home squadron, and the recently formed cruiser squadron by the King at Spithead a week later ended the coronation festivities. The three squadrons massed there were the force maintained for the defense of British shores in the event of a conflict on the seas. The Channel squadron consisted of 6 battle-ships and 4 cruisers, the home fleet of 10 battle-ships and 6 cruisers, and a cruiser squadron of 6 ships. There were also 3 flotillas of destroyers which exhibited their speed and maneuvers. On coronation day the King presented to the nation Osborne house and estate, in the Isle of Wight, the private property and favorite residence of the late Queen, left to him by her will, and in making the gift he expressed a hope that it be converted into a convalescent home for invalid officers of the navy and army. Parliament subsequently voted the sum necessary to carry out this purpose. Many peers were created or elevated in the peerage and other distinctions were conferred. A new order of merit was instituted, the Imperial Service order, to which 250 companions can be appointed from the home civil service and 175 from the colonies and protectorates after twenty-five years of meritorious service or sixteen years in unhealthful colonies or protectorates.

The Autumn Session.—When Parliament reassembled the Government demanded all the time for its own measures. The Irish members demanded a day for reviewing the conduct of the Irish executive. This Mr. Balfour would not promise unless the leader of the Opposition, Sir Henry Campbell-Bannerman, was prepared to move a vote of censure. A violent demonstration accompanied the adoption under the closure of the Government motion, resulting in the suspension of an Irish member who had already been sentenced in Ireland to six months' hard labor. The Nationalists in Ireland were in a different situation than they were when the former land war brought them into conflict with the authorities of Dublin Castle. Now, through the county councils, they controlled the whole local administration. Their indignation was the greater at the suspension of trial by jury and *habeas corpus* and the application of the other despotic features of the crimes act throughout the greater part of Ireland where there were no agrarian or political disturbances, though the excitement was rendered intense by the action of the Government.

Colonies and Dependencies.—British colonies are broadly distinguished as colonies having responsible government, colonies having representative legislative bodies, but an executive responsible to the Crown, and Crown colonies. In the first class the executive power resides in the ministers, who are responsible to the colonial Parliament, and the Imperial Government assumes no right of veto or interference excepting for grave imperial reasons. In the second class the governor appointed by the Crown and the officials of his own selection forming his council have varying degrees of initiative and control in legislation according to the terms of the colonial charter. In Crown colonies the governor and his council are the legislative and executive authority under the British Colonial Office. The rights of the Crown in all colonial affairs are committed to the Secretary of State for the Colonies. The British Government spends about £2,000,000 on the colonies, mainly for military and naval purposes. From the colonial revenues Ceylon contributes £128,000 a year for defense; Mauritius, £26,000; Hong-Kong, £70,000; Straits Settlements, £126,000; Malta, £5,000; Natal, £4,000; West Africa, £10,000; Canada, £21,000; total, £390,000. India pays £270,000 a year for home charges and £335,000 for deferred pay of British troops serving in India. Egypt pays £87,000 for the army of occupation. The number of British garrison troops in the colonies in 1902 was 63,456, of which 5,466 were in Gibraltar, 10,840 in Malta, 135 in Cyprus, 15,185 in Cape Colony and Natal, 3,583 in Mauritius, including 2,048 colonial troops, 727 in St. Helena, including 517 colonials, 2,262 in Sierra Leone, including 2,100 colonials, 5,436 in Egypt, 1,783 in Halifax, 327 in Esquimault, 3,068 in Bermuda, including 1,011 colonials, 1,774 in Jamaica, including 1,050 colonials, 1,529 in Barbados and St. Lucia, including 600 colonials, 1,778 in Ceylon, including 265 colonials, 2,719 in Straits Settlements, including 1,215 colonials, 4,425 in Hong-Kong, including 2,463 colonials, 1,289 in Wei-Hai-Wei, including 1,083 colonials, 1,130 not detailed, including 1,100 colonials. The British forces in India numbered 73,518 officers and men.

The prime ministers of the self-governing colonies held a conference in London in the summer of 1902 under the presidency of the Colonial Secretary. They decided that it would be of advantage to the empire to have conferences every four years, at which the Secretary of State for the Colonies and the prime ministers of self-governing colonies could discuss and consider questions of common interest affecting the mother country and the British dominions over the seas; that in negotiating treaties the Imperial Government should obtain the views of colonies affected; that greater facilities should be given to young colonists to enter the British army and navy; that in Government contracts, either of the imperial or colonial governments, the products of the empire should be preferred to those of foreign countries; that shipping subsidies should be increased on condition that no excessive freight charges should be made nor any preference given to foreigners, and that the steamers shall be at the service of the Government in war time; that the privilege of coastwise trade, including the trade between the mother country and the colonies or between one possession and another, should be denied to countries in which the corresponding trade is confined to ships of their own nationality; that it is advisable to adopt the metric system of weights and measures throughout the empire; that there should be mutual protection of patents in the

various parts of the empire; that in future cable franchises a clause should be inserted reserving to the government or governments concerned the right of purchasing the cables; that cheap postage for newspapers and periodicals between different parts of the empire should be adopted. The contribution of Australia to imperial naval defense was increased to £200,000 per annum, that of New Zealand to £40,000, both to be applied to an improved Australasian squadron and the establishment of branches of the royal navy reserve; Cape Colony's contribution toward the general maintenance of the navy was increased to £50,000 a year, and Natal contributes £35,000 for the same purpose; Newfoundland gives £3,000 a year and will build a training-ship for a branch of the navy reserve; with other colonies correspondence was continued. The conference considered that the principle of preferential trade between Great Britain and the colonies would stimulate and facilitate mutual commercial intercourse and strengthen the empire by promoting the development of the resources and industries of the several parts, but recognized that in the present circumstances of the colonies it is not practicable to adopt a general system of free trade within the empire; it was considered desirable, however, that those colonies which have not already adopted such a policy should as far as their circumstances permit give substantial preferential treatment to the products and manufactures of the United Kingdom. The representatives of Canada were prepared to recommend to their Parliament the existing preference of 33½ per cent. and an additional preference on lists of selected articles to be given either by further reducing duties on British goods or by raising the duties on foreign imports or imposing duties on such as are now free. New Zealand's Premier proposed for his colony a general reduction of 10 per cent. on British manufactured goods, or a reduction of duties in favor of Great Britain, or an increase or imposition of duties against foreign countries on lists of selected articles. The representatives of the Cape of Good Hope and Natal proposed for South Africa a preference of 25 per cent. in favor of Great Britain or an equivalent increase in the duties on foreign imports except articles on which there are special rates. In discussing the naval defense of the empire the premiers and the British ministers could not agree on a general resolution. Lord Selborne promised that Australia and New Zealand should have the privilege of manning one of the ships of the new Australasian squadron and that 10 cadet ships in the royal navy should be allotted annually to them, but he insisted that the British navy must be all one and praised Cape Colony and Natal for contributing money for its support unreservedly. In the discussion of military defense the Secretary of State for War recommended the colonies to raise special corps for imperial defense, to be trained by British officers or so trained at any rate that they could be put in line with British regulars against European troops. The Premier of New Zealand approved special bodies of troops set apart for imperial service. The representatives of Cape Colony and Natal were disposed to fall in with this policy. The Canadian and Australian premiers, on the other hand, believed in raising the standard of training in the general body of the colonial forces and organizing the departmental services and the equipment required for the mobilization of a field force, leaving it to the colony to determine how and to what extent it should render assistance; whereas, to estab-

lish a special force for imperial service, practically under the control of the Imperial Government, would derogate from the powers of colonial self-government and tend to impede the general improvement of the defense forces in training and organization.

Great Britain possesses in Europe naval bases in the Mediterranean at Gibraltar, Malta, and Cyprus. *Gibraltar* is a naval and military fortress over which a military officer is invariably appointed Governor, Gen. Sir George Stewart White in 1902, in whom are vested all legislative and executive powers. The area is less than 2 square miles, with a population in 1901 of 27,460, including the garrison. The local revenue in 1900 was £61,418, and expenditure £61,812; military expenditure of the Imperial Government, £305,903. The aggregate tonnage entered in 1900 was 4,408,197, of which 3,017,565 tons were British.

The island of *Malta* has an area of 117 square miles, including Gozo and Comino, with a population of 188,141 in 1901. The Governor, Lieut.-Gen. Sir Francis Wallace Grenfell in 1902, is assisted by a Council of 6 official and 13 elected members. The revenue in 1900 was £356,758, and expenditure £365,943. The chief sources of revenue are customs, yielding £193,367; land, £12,900; rents, £27,627; post-office, £15,219; interest, £29,390; licenses, £78,255. The expenditure was £135,334 for administration and £223,868 for other purposes. The debt is £79,168. Cotton goods, potatoes, oranges, figs, honey, and wheat are exported. The production of wine is the largest industry. The total value of imports in 1900 was £7,434,289, and of exports £6,471,567. This trade is for the most part in transit, only £1,026,829 of the imports being landed in the island, of which £48,802 were reexported. The number of vessels entered was 3,814, of 3,538,088 tons; cleared, 3,801, of 3,531,542 tons. The imports of foodstuffs and manufactured goods from the United States have increased since the establishment of direct steam navigation. Only one-third of the imports come from Great Britain. The British fleet and garrison have been greatly increased and a great number of families of British soldiers and of officers and men of the navy are living there. The military and naval works that are in progress have given profitable employment to the laboring class on the island. The British Parliament in 1901 voted £1,000,000 for a breakwater. The elect members of the Council refused to vote supplies for public improvements, upon which the Governor imposed taxes to carry them out. The proclamation threatening to abolish Italian as the language of the courts in fifteen years roused excitement and resentment in Italy as well as in Malta, and consequently Mr. Chamberlain withdrew it in January, 1902. In cases where a British subject is tried criminally English is used, and in civil cases where a British subject is a party English may be used by either of the parties, the judge, or any one of the counsel, witnesses, or jury. Children in the schools have been taught for the first two years in Maltese, a dialect of Italian, with elements derived from Arabic and other languages. After two years parents were given the option of Italian or English as the language of instruction for their children. Nearly all chose English as of greater value in business and not to be learned outside of school as Italian could be. As the result of the agitation against the Anglicizing policy of the Government, Italian again became the choice of about a quarter of the people. At the same time when he announced the withdrawal of the proclamation Mr.

Chamberlain threatened that if the Council persisted in vetoing taxes and expenditures which, as far as they were needed for the benefit of the garrison or fortress were afterward decreed by orders in council, the Constitution would be modified so as to give the official members a majority over the elective members in the Council of Government. The Governor conveyed this warning to the Council, which voted only a month's supplies at a time, but refused the education vote, awaiting the decision of the Government as to the school language. The elective members resigned on Feb. 16 as a protest against the coercion and autocracy implied in the Governor's threat. The official members voted supplies for schools and other purposes up to the end of the fiscal year. All the members who resigned were reelected on March 11 unopposed on a program protesting against the new taxes and the substitution of English for Italian in the schools, but leaving room for conciliation. When the Council of Government assembled on March 21 the elective members refused to consider the estimates until the Government declared its policy on the language question. The Government announced that Maltese would be used only in the first year instead of two years. The Council would vote no money for education. Mr. Chamberlain refused to alter his policy. The Legislative Council passed an education bill to maintain only the Italian language in the schools and voted the estimates with this proviso. The Government disallowed the bill.

Cyprus is still a part of the Ottoman Empire, but the island is administered by Great Britain under a convention concluded at Constantinople on June 4, 1878. The British High Commissioner, who has all the powers of a governor, is Sir William F. Haynes Smith. There is a Legislative Council of 6 official and 12 elective members. The area is 3,584 square miles, and the population in 1901 was 237,022, exclusive of the garrison, comprising 121,066 males and 115,956 females, 182,739 of the total number members of the Greek Oriental Church, 51,309 Moslems, and 2,974 Jews and others. Nicosia, the capital, had 14,752 inhabitants. The revenue, derived from tithes collected in kind, a building tax, licenses, military exemption, a tax on pigs, sheep, and goats, customs and excise duties, stamps, and the salt monopoly, amounted in the year ending March 31, 1901, to £215,268; expenditure, £135,388. The public debt is £314,000, advanced by the British Government in 1899 for harbor works, railroads, and irrigation. A grant of £32,000 was given by the British Government for 1901. In 1902 a grant of £30,000 was voted. An annual tribute of £92,000 is paid to the Sublime Porte. The crop of wheat in 1899 was 53,973 tons; of barley, 61,010 tons; of olives, 3,423 tons; of cotton, 838 tons in 1898. Various fruits are raised, and grapes are made into wine. Other products are carobs, linseed, silk, cheese, wool, and hides and skins. Sponges of the value of £20,000 or more are obtained off the coasts, but the fishers are foreigners. Gypsum, amber, and copper are the mineral products. The value of imports in 1900 was £289,874; exports, £338,371. The tonnage entered and cleared was 509,826. Irrigation wells have been dug, but so far the people do not use the water in ordinary seasons; and therefore the Government delays completing the scheme of irrigation.

Aden, a peninsula on the coast of Arabia, is a coaling station on the Suez Canal route to the East. The area is 75 square miles, and that of the island of Perim is 5 square miles. The total

population in 1901 was 41,222, consisting of 28,180 males and 13,042 females. The imports in 1901 were 34,941,592 rupees by sea and 2,960,994 rupees by land, besides 2,461,323 rupees of specie; exports, 28,770,554 rupees by sea and 1,140,755 rupees by land, besides 3,643,502 rupees of specie. In 1900 the port was visited by 1,224 steamers, of 2,467,665 tons. The number of local vessels was 1,687, of 52,906 tons. At Perim 648 merchant vessels called. Coffee, gums, hides and skins, piece goods, grain, and tobacco are imported and exported. The local revenue is raised by duties on opium, liquor, and salt. The Political Resident at the head of the administration is subordinate to the Governor of Bombay. The island of *Socotra*, with an area of 1,382 square miles and 12,000 of population, produce gums, dates, butter, and animal products. The *Kuria Muria Isles* are leased to a guano company. The *Bahrein Islands*, about 200 square miles in area, with a population of 80,000, have valuable pearl fisheries. Dates, reed mats, sailcloth, and donkeys are also exported. The chief part of the trade is with India. The value of imports in 1900 was £450,775; exports, £486,142. The tonnage entered was 60,307; cleared, 58,619 tons. Exports of pearls were £264,114, a smaller sum than in former years owing to disease among the oysters.

British North Borneo has an area of 31,106 square miles and about 175,000 inhabitants. The territory is exploited by a chartered company. *Tembunan*, having an area of 500 square miles and 25,000 inhabitants, was occupied in 1899. The lands near the coast have been sold to planters who raise tobacco, pepper, coconuts, Manila hemp, and gambier. The revenue for 1900 was \$588,026 in silver; expenditure, \$1,386,055, including \$983,186 of capital expenditure on railroads and public works. The value of imports was \$3,336,621; exports, \$3,178,929. The exports of tobacco were 8,625 bales, valued at £92,000. Other exports are timber, trepang, pearls, gutta-percha, sago, coconuts, rattan, edible birds'-nests, and various sea and jungle products. *Labuan* has been under the jurisdiction of the British North Borneo Company since 1889. The Governor of British Borneo is Edward Woodford Birch. *Brunei* is a native state in Borneo under British protection, having an area of 15,000 square miles and 45,000 population. Sago is the chief exportable product. *Sarawak*, another native state, has an area of 50,000 square miles and 600,000 population. The Rajah is Sir Charles Johnson Brooke, born June 3, 1829, nephew of the founder of the state, an Englishman who obtained the cession of territory from the Sultan of Brunei. Much of the land has been sold to planters who raise the same products as in North Borneo. There are large beds of coal and deposits of gold, silver, diamonds, quicksilver, and antimony. The value of imports in 1900 was \$6,159,125; exports, \$6,865,861; revenue, \$915,966; expenditure, \$901,172. A railroad from Jesselton, on the west coast, will be carried across the island, and has been completed for 92 miles. In eight years, during which the tobacco culture has been developed, the revenue has trebled and imports and exports have kept pace. In June, 1902, an expedition of 12,000 men which went up the Batang Lupar river to punish a tribe of Dyak head-hunters had to return because cholera suddenly broke out and caused 2,000 deaths in four days.

Ceylon has a Legislative Council of 9 official members and 8 representing the different races and classes. The Governor is Sir Joseph West Ridgeway. The area of the island is 25,333

square miles. The population on March 1, 1901, was 3,576,990, showing an increase of 1.87 per cent. per annum since 1891, consisting of 9,583 Europeans, 23,312 Burghers, 2,334,817 Singhalese, 952,237 Tamils, 224,719 Moors, 11,207 Malays, and 21,115 others, including 4,913 Boer prisoners, 3,215 Veddahs, and a few Egyptian exiles. The Tamil immigrants employed on the tea plantations numbered 441,523, an increase of 68.4 per cent. in ten years. The population of Colombo, the capital and chief port, was 158,093. The revenue in 1900 was 27,325,930 rupees; expenditure, 25,321,988 rupees, exclusive of 3,626,939 rupees expended from the surplus on railroads. The revenue from customs was 7,228,293 rupees; from land sales, 818,796 rupees; from liquor licenses, 3,233,574 rupees; from stamps, 2,037,052 rupees; from Government timber and salt, 1,485,506 rupees; from port dues, 1,319,378 rupees; from railroads, 8,239,679 rupees. The chief expenses were 6,049,057 rupees for civil establishments; 2,366,350 rupees of military expenditure, including the cost of the volunteer force and the fortifications at Colombo, of which the Imperial Government paid 1,887,768 rupees; pensions and retiring allowances, 1,147,878 rupees; interest on loans, 2,802,422 rupees; expenditure on public works, 3,493,902 rupees. The public debt on Jan. 1, 1901, amounted to £3,419,451 sterling and 3,239,585 rupees, all of it incurred for public works, especially the railroads, the Colombo water-works, and the breakwater. Besides the fortifications at Colombo, the Imperial Government maintains a naval harbor at Trincomalee, the headquarters of the fleet on this station. The colony has the erection of modern fortifications at Colombo and the Imperial Government has furnished the guns. The British garrison numbers 2,982 men, and for its maintenance the colony pays the Imperial Government 1,845,095 rupees a year. The volunteer force numbers 2,112, costing 229,614 rupees in 1900. The total value of imports in 1900 was 122,339,758 rupees; exports, 108,926,257 rupees. The exports of tea were 53,735,257 rupees in value; of plumbago, 9,792,495 rupees; of coconut products, 16,438,308 rupees; of cacao, 1,651,146 rupees; of areca-nuts, 1,597,755 rupees; of coffee, 593,634 rupees; of cinchona, 64,976 rupees. The exports of tea were 129,661,908 pounds in 1899, having grown from 2,392,975 pounds in 1884. The export of cacao in 1899 was 42,527 hundredweight, having increased nearly sixfold since 1885. Coffee exports declined from 824,509 hundredweight in 1879 to 12,692 hundredweight in 1898 owing to disease among the plants. When the British import duty on tea was raised in 1900 from 4d. to 6d. a pound the principal market for Ceylon tea, which was selling at an average price of 8d., was contracted and the export price declined. The area under tea in 1902, owing to this, was 6,000 acres less than in the preceding year, while the acreage of rubber, cinchona, cardamoms, and cacao increased correspondingly. The tea-crop of 1902 was abundant. The tonnage entered and cleared during 1900 was 8,487,940. The registered shipping on Jan. 1, 1901, consisted of 185 sailing vessels, of 13,830 tons, and 6 steamers, of 1,001 tons.

The railroads completed in 1900 had a length of 297 miles, and 215 miles more were projected. There were 1,438 miles of telegraph and 205 miles of telephone lines. Tributary to the Ceylon Government are the *Maldiv Islands*, having a population of 30,000 Mussulmans who are enterprising traders and sailors governed by a hereditary Sultan. The breakwaters at Colombo will make that port a harbor of refuge between Bombay and

Calcutta, one of the largest artificial harbors in the world, with a slipway, a graving-dock, and a coal depot. About 3,300 workmen are employed on these works. The trade of the island is thriving, and a further extension of the harbor is contemplated. Great progress has been made in railroads and irrigation works. Pearl fishing has been extended by the Government. Exploration for gold was started by mining experts among the 5,000 Boer prisoners under Government auspices. All these prisoners, including some Americans, were returned to their own countries before the end of 1902.

The *Straits Settlements* comprise Singapore, Penang, and Malacca. The island of Singapore has an area of 206 square miles. The island of Penang has an area of 107 square miles. Province Wellesley, on the Malay peninsula, the Dindings, which belong to Penang, and Malacca, on the western coast, make the total area of the Straits Settlements 1,472 square miles. The population of Singapore in 1901 was 228,555, comprising 2,619 male and 1,205 female Europeans and Americans, 2,015 male and 2,015 female Eurasians, and 166,241 male and 54,370 female Asiatics; the population of Penang was 248,207, comprising 706 male and 451 female Europeans, 929 male and 1,016 female Eurasians, and 155,169 male and 89,933 female Asiatics; the population of Malacca was 95,487, comprising 54 male and 20 female Europeans and Americans, 754 male and 844 female Eurasians, and 50,661 male and 43,154 female Asiatics; total population of the Straits Settlements, 572,249, comprising 3,382 male and 1,676 female Europeans and Americans, 3,698 male and 3,965 female Eurasians, and 372,071 male and 187,457 female Asiatics. The Asiatic population included 215,058 Malays, 281,933 Chinese, and 57,150 British Indians. The births recorded in Singapore in 1900 were 4,280, and deaths 9,785; in Penang, 2,377 births and 5,085 deaths; in the Dindings, 112 births and 125 deaths; in Province Wellesley, 3,969 births and 3,662 deaths; in Malacca, 4,076 births and 3,128 deaths. In 1900 the number of Chinese immigrants who arrived in the colony was 200,947; of Indian immigrants, 35,351, of whom 7,615 were indentured laborers; returned to India, 10,995. The acting Governor in 1902 was Sir F. A. Swettenham. The Governor of the Straits Settlements is also High Commissioner for the Federated Malay States and High Commissioner and Consul-General for Borneo. There is a Legislative Council of 9 official members, 5 other members appointed by the Governor, and 2 members representing the Chambers of Commerce in Singapore and Penang. The revenue of the colony in 1900 was \$5,386,557, and expenditure \$6,030,744. Of the revenue \$3,317,698 came from licenses, \$449,898 from stamps, \$235,405 from the post-office, \$199,552 from port dues, and \$288,540 from land. Of the expenditure \$1,775,771 went for salaries, \$1,814,621 for public works, \$110,675 for education, \$131,109 for police, \$90,801 for the marine department, \$10,383 for transport, and \$956,051 for military expenses. Of the total revenue the sum of \$3,244,090 was collected in Singapore, \$1,736,113 in Penang, and \$406,354 in Malacca. The debts of the colony on Jan. 1, 1901, were \$8,085,290, and the assets were valued at \$10,183,163. There is an armed police of 38 officers and 1,188 men. There is a volunteer artillery battery numbering 111 officers and men, and volunteer rifle companies of 150 men have been formed in Singapore and Penang. The newly constructed harbor at Singapore is defended by modern forts built entirely at the cost of the colony, the expenditure having been £100,000.

The Imperial Government furnished the guns and maintains a garrison of 1 battalion of infantry, 2 batteries of artillery, engineers, submarine miners, etc. The value of imports in 1900 was \$314,089,860, of which \$32,890,847 came from Great Britain, \$99,063,660 from British colonies, and \$182,135,353 from other countries. The value of exports was \$262,617,345, of which \$60,402,056 went to Great Britain, \$33,778,914 to British colonies, and \$168,436,375 to other countries. Of the imports, \$251,709,000 went to Singapore, \$71,220,412 to Penang, and \$2,322,036 to Malacca, and of the exports, Singapore shipped \$205,534,527, Penang \$68,133,165, and Malacca \$2,787,128. The imports of rice were \$25,101,160; of opium, \$15,496,401; of cotton goods, \$14,789,391; of coal, \$7,979,070; of fish, \$6,756,731; of tobacco, \$4,380,741; of petroleum, \$4,365,130. The exports of tin were \$60,767,602; of gums, \$19,135,903; of spices, \$14,526,785; of rattan, \$6,780,206; of tapioca and sago, \$6,779,564; of gambier, \$6,681,136; of copra, \$4,574,193. The number of vessels entered in 1900 was 8,720, of 7,238,185 tons, besides 16,855 native vessels, of 721,359 tons; the number cleared was 8,722, of 7,231,220 tons, and 17,986 native vessels, of 724,189 tons.

The Federated Malay States are under British protection. Sir F. A. Swettenham has been Resident-General since 1896. British residents and other officials have directed affairs in Perak, Selangor, and Sungei Ujong since 1874. The British officials and the superior native authorities form in each state a state council which has supreme control. Pahang was taken under British protection in 1887. In 1889 the states on the frontier of Malacca were confederated under the name of Negri Sembilan, to which was joined Sungei Ujong in 1895. When a Resident-General for the four protected states was appointed the states agreed to furnish troops for service in the colony in case of war between Great Britain and any other nation. Perak, with an area of 10,000 square miles, had in 1901 a population of 328,801, composed of 243,022 males and 85,779 females. Selangor, which has an area of 3,500 square miles, had 167,890 inhabitants, 135,977 males and 31,916 females. Negri Sembilan, having an area of 3,000 square miles, had a population of 96,028, divided into 64,565 males and 31,463 females. The area of Pahang is 10,000 square miles, and the population was 83,419, of whom 47,749 were males and 35,670 females. The total population was 676,138, comprising 1,361 Europeans, 1,531 Eurasians, 313,763 Malays, 303,364 Chinese, and 52,501 East Indians. The military force, called the Malay States guides, has 12 European officers and a strength of 632 men. There is a police force of 1,970 men officered by 39 Europeans. The revenue of Perak in 1900 was \$7,636,126, and expenditure \$6,144,744; the revenue of Selangor was \$6,303,165, and expenditure \$4,944,160; the revenue of Negri Sembilan was \$1,251,366, and expenditure \$1,009,318; the revenue of Pahang was \$419,150, and expenditure \$630,678; total revenue of the Federated States, \$15,609,807; total expenditure, \$12,728,900. Of the revenue, \$7,050,382 came from the duty on tin, \$2,092,420 from railroads, \$3,079,755 from licenses, \$712,898 from land, and \$191,525 from posts and telegraphs. Of the expenditures, \$1,971,971 went for emoluments, \$4,694,500 for railroads, and about \$2,800,000 for public works. Negri Sembilan has a debt of \$39,452, Pahang one of \$3,643,271. The British Government proposed to loan £500,000 to the federation in 1899 for railroad construction, but the redundant revenue has provided all the money needed. The exportation

of tin in 1900 was 21,166 tons from Perak, 16,041 tons from Selangor, 4,300 tons from Negri Sembilan, and 935 tons from Pahang. The average export price was £130 a ton. From Pahang 17,048 ounces of gold were exported. Liberian coffee is cultivated in most of the states, and pepper, gambier, sugar, rice, and tapioca are valuable products. The trade of Perak in 1900 amounted to \$14,741,148 of imports and \$29,190,663 of exports; of Selangor, \$18,406,571 of imports and \$21,798,444 of exports; of Negri Sembilan, \$4,281,457 of imports and \$7,048,988 of exports; of Pahang, \$973,405 of imports and \$2,322,950 of exports; total imports, \$38,402,581; total exports, \$60,361,045. There were 114 miles of railroads in Perak, 97 miles in Selangor, and 25 miles in Negri Sembilan on Dec. 31, 1900. Johor, a native state which has placed its foreign relations in the hands of the British, produces pepper, coffee, tea, gambier, sago, and gutta-percha.

The *Cocos Islands*, having a population of 554, have been administered from Singapore since 1886. They produce coconuts in abundance and export oil and copra. *Christmas Island*, containing immense quantities of phosphate, were annexed to Singapore in 1900, when 550 Chinese, Malays, and Sikhs were taken to the island to dig phosphate, of which 37,000 tons were shipped the first year and in 1901 as much as 200,000 tons.

Hong-Kong, a Crown colony on the coast of China, has an area of 29 square miles and a population of 283,975 in 1901, exclusive of 13,237 soldiers and sailors. The white population in 1891 was 8,545, of whom nearly half were of Portuguese origin, one-third British, and the rest Germans, Americans, French, Spanish, etc. In 1900 the immigration from China was 121,322 and the number of Chinese emigrants was 83,643. In a convention signed on June 9, 1898, China leased to Great Britain for ninety-nine years the Chinese port of Kaulung and territory adjoining Mira Bay having an area of 376 square miles and a Chinese population of 100,000. A police force of 27 Europeans and 105 Indians has been organized for the new territory, where in 1900 a revenue from Crown rents of \$17,530 was collected, while expenditure on police was \$102,292 and on public works and other objects \$243,362. The revenue of Hong-Kong in 1900 was \$3,235,329 from ordinary sources and \$967,257 from premiums on land and water account; the expenditure was \$3,155,242 for ordinary purposes and \$473,205 for defensive works, water, and other extraordinary purposes. On civil establishments the expenditure was \$1,532,909. The British garrison is about 3,600 strong, and the volunteers number 366. The contribution of the colony in aid of military expenditure was \$655,686 in 1900. The debt incurred for water-supply, fortifications, and sanitary works is £341,800. The assets of the colony exceeded the liabilities by \$1,532,909 on Jan. 1, 1901. The imports are about £4,000,000 and exports £2,000,000. The free port of Hong-Kong is the distributing point for the trade in Indian opium with China and for the trade in kerosene, salt, cotton goods, and many other imports, and it is the port from which much of the tea, silk, and other Chinese products are shipped. The registered shipping on Jan. 1, 1901, consisted of 17 sailing vessels, of 6,590 tons, and 40 steamers, of 23,507 tons. During 1900 the number of merchant vessels entered was 5,473, of 7,021,982 tons, besides 17,732 junks, of 1,604,632 tons. About half the foreign trade is English, and the rest is mainly with India, Australia, the United States, and Germany. The Governor in 1902 was Sir Henry A. Blake.

Wei-Hai-Wei, a port on the peninsula of Shantung in China, was leased on July 1, 1898, to Great Britain for as long a period as the Russians shall retain possession of Port Arthur. The area of the leased district is 270 square miles, with 123,750 inhabitants. In a neutral zone beyond the leased territory Great Britain has the right to erect fortifications and post troops for the defense of Wei-Hai-Wei, but Chinese administration must not be disturbed. Parliament voted £130,000 in 1899 for the defense of Wei-Hai-Wei. A battery of royal artillery 128 strong is garrisoned there, with 58 engineers, and 8 companies of Chinese infantry, 1,083 men, have been recruited and trained. The British Commissioner is J. H. Stewart Lockhart. The natives are fishermen and farmers. Salt fish of the value of \$60,000 are exported. The British Government after building two forts abandoned the plan of making Wei-Hai-Wei a naval base. Early in 1902 the intention was announced of converting it into a sanatorium for officers and men of the fleet and a seaside resort for Europeans in Chinese ports.

Mauritius is an island in the Indian Ocean, having an area of 705 square miles and a population according to the census of 1901 of 367,472, exclusive of 2,935 soldiers living in barracks and non-resident seamen. The Governor is Sir Charles Bruce. There is a Council of Government consisting of 8 official, 9 nominated, and 10 elected members. There were 209,079 Hindus and 34,763 Mohammedans in 1891. The number of Chinese was estimated in 1900 at 3,226. The Orientals are displacing the white creoles as proprietors and planters. The revenue in 1900 was 9,179,975 rupees; expenditure, 8,568,943 rupees; debt, £1,189,284, besides which a loan of £32,820 was authorized in 1899 for public works and one of £100,000 in 1901 for reforestation. The imperial garrison in 1900 was 2,139 men. The colony contributed £31,753 for military expenses. The value of imports in 1900 was 18,276,360 rupees; of exports, 31,403,286 rupees, of which 28,836,354 rupees represent raw sugar; 224,086 rupees, rum; vanilla, 169,821 rupees; aloe fiber, 940,432 rupees; coconut-oil, 46,479 rupees. There were 266 vessels, of 337,834 tons, entered in 1900 and 268, of 333,706 tons, cleared. The registered shipping of the colony consisted of 63 sailing vessels, of 5,103 tons, and 3 steamers, of 497 tons. There are 105 miles of railroads and 135 miles of telegraph-line, with cable connection with Zanzibar by way of the Seychelles and with Australia and Natal. The dependent island of Rodriguez has a population estimated at 3,163. Diego Garcia, the largest of the Chagos Islands, has 700 inhabitants, mostly negroes from Mauritius who extract coconut-oil, of which 4,806 hectoliters was exported in 1900. The *Seychelles* and dependent islands have an area of 148 square miles, with 20,275 inhabitants. The revenue in 1900 was 399,312 rupees; expenditure, 351,920 rupees, including a debt of 55,000 rupees repaid to the Mauritius Government. The imports in 1900 were 980,911 rupees in value; exports, 1,036,161. Coconut-oil, soap, vanilla, guano, fish, coffee, cacao, and tortoise-shell are exported.

Most of the small islands and groups in the Pacific have been annexed by Great Britain, even the uninhabited rocks in the ocean. *Fiji* was annexed in 1874, and the rule of the native queen and chiefs was replaced by that of a Crown Governor, Sir G. T. M. O'Brien in 1902, assisted by a Legislative Council of 6 official and 6 nominated members. The chiefs still administer as salaried officials two-thirds of the provinces and

preserve many of the native laws and customs. The islands have an area of 8,045 square miles, including Rotumah. The population of Fiji in 1901 was 117,870, comprising 2,447 Europeans, 17,105 East Indians, 94,397 Fijians, and 3,921 Polynesians and others. The revenue for 1900 was £111,569, the expenditure £100,022. The imports were £349,890 in value; exports, £619,836. European planters grow bananas, coconuts, and sugar, and the exports in the order of their importance are sugar, copra, rum, and bananas. The Governor of Fiji is High Commissioner of the Western Pacific, having authority to enforce the acts of Parliament for the protection of Pacific islanders and to settle disputes between British subjects living in the islands.

Tonga is a group ruled still by a native king, George II, born in 1874, who was under the joint protection of Germany, Great Britain, and the United States until in accordance with the Anglo-German agreement of Nov. 14, 1899, England proclaimed a protectorate on May 19, 1900. The Legislative Assembly is composed half of nobles and half of elected representatives of the people. The islands have an area of 174 square miles and a population of 20,677, including 239 Europeans. The revenue is about \$100,000. The imports in 1899 amounted to £70,911. The exports are copra, bananas, fungus, mats, and fishnets. The neighboring Savage island was made a British protectorate on April 20, 1900. The Pitcairn Islands, a British settlement, produce coconuts, fruit, coffee, corn, and arrowroot. *Norfolk Island*, with an area of 10 square miles and 870 population, settled by Pitcairn Islanders in 1856, was attached to New South Wales in 1896. The New Hebrides are under the joint protection of France and Great Britain. A mixed naval commission was created in 1888 for the protection of natives and the adjudication of disputes between French and British. In 1902 each Government appointed a resident deputy commissioner to look after the interests of its nationals and keep them in order. French planters have acquired lands which British missionaries say the natives should not in their own interest sell. Australia and New Zealand are jealous of any progress that the French make, desiring to annex the islands themselves. England is negotiating for a joint commission to settle land disputes.

The *British Solomon Islands*, having an area of 8,357 square miles, were annexed in 1897 and 1898 and extended in 1900 by the addition of Choiseul and Isabel under the Anglo-German agreement. The revenue in 1900 was £1,454, to which the Imperial Government added £2,500 to cover an expenditure of £3,120. About 850 of the islanders were engaged in 1900 as contract laborers on the Queensland sugar plantations and 90 went to Fiji, while 500 returned. The exports in 1900 were £21,380, consisting of copra, tortoise-shell, ivory-nuts, etc. In the *Manihiki* group, about 1,000 natives live on an area of 12 square miles. The *Tokelau* group has an area of 7 square miles, with 1,050 inhabitants. The *Ellice Islands*, with an area of 14 square miles, have 2,400. The *Gilbert Islands* have an area of 166 square miles and a population of 35,200 and in 1900 exported £21,165 worth of copra. *Suvaroff*, *Dudoza*, *Victoria*, *Duce*, *Santa Cruz*, *Duff*, *Starbuck*, *Malden*, *Jarvis*, *Christmas*, *Fanning*, *Washington*, *Palmyra*, *Baker*, *Phoenix*, and other islands are mostly coral atolls on which the coconut-palm flourishes on rocky eminences covered with guano.

Ascension, an island in the Atlantic, is used as a coaling and victualing station and health re-

sort for the naval forces stationed on the west coast of Africa; it has an area of 35 square miles and a population of about 250 British sailors and marines and officers with their families and 180 Kroomen. *St. Helena*, a volcanic island farther south, has an area of 47 square miles and had in 1901 a population of 9,850, including 1,532 soldiers of the garrison, 321 sailors, and 4,655 Boer prisoners. The resident population, of British descent, has been diminished by emigration to Cape Colony and the United States. The number of marriages in 1900 was 35; of births, 116; of deaths, 165. The revenue in 1901 was £15,394, and expenditure £12,603; imports were £168,282, and exports £4,215. The tonnage entered and cleared was 162,032. The Governor is R. A. Sterndale. *Tristan da Cunha*, a small island in the middle of the South Atlantic, with Gough's island, and Inaccessible and Nightingale islands, is a British possession of no military or commercial importance. About 60 persons, descendants of shipwrecked sailors who found wives in St. Helena, raise cattle, sheep, pigs, geese, beans, and potatoes for food and are visited every year by a British war-vessel. The *Falkland Islands*, near the coast of Patagonia, have an area of 6,500 square miles and a population in 1901 of 2,043, consisting of 1,203 males and 840 females. The Governor, William Grey Wilson, is assisted by an Executive Council and an elective Legislative Council. Wool, skins, and tallow are exported. The value of imports in 1900 was £66,948, and of exports £111,539. The revenue was £15,576; expenditure, £15,501. There are 762,000 sheep on the islands.

The *Bermuda Islands*, in the north Atlantic, have an area of 20 square miles and a population in 1901 of 17,535, of whom 6,383 are whites and the rest colored and negroes. The number of marriages in 1900 was 162; of births, 681; of deaths, 423. The Governor is Lieut.-Gen. Sir H. Le G. Geary. There is a Legislative Council of 9 nominated members and a House of Assembly of 36 members elected by 1,124 registered voters. The revenue in 1900 was £40,124, and expenditure £47,532. The Imperial Government contributed £2,200 in 1902, when revenue was estimated at £41,469, and expenditure at £41,481. The public debt in 1900 was £49,600. The value of imports in 1900 was £397,136; exports, £93,769. The value of onions exported was £43,486; potatoes, £25,207; lily-bulbs, £11,382. The tonnage entered and cleared in 1900 was 729,832. The registered shipping of the colony consisted of 24 sailing vessels, of 6,506 tons, and 2 steamers, of 64 tons. There are 167 miles of land telegraph and 15 miles of cable, and the telephone company has 700 miles of wire.

British Guiana has an area estimated at 120,000 square miles, with 278,328 inhabitants, of whom 2,533 are Europeans, 105,463 East Indians, 3,714 Chinese, and 99,615 of negro descent. In 1901 the number of Indian coolies arriving was 4,464, while 1,017 returned to India. The Governor is Sir James Alexander Swettenham. There is a Court of Policy consisting of 7 officials and 8 elective members, to which are added 6 elective financial representatives to form the Combined Court. There are 2,467 registered voters. The revenue in 1901 was £509,950, and expenditure £505,492. Of the revenue, customs yielded £310,606; licenses, £87,760; duty on rum, £18,991; royalty on gold, £16,639. Of the expenditures, the civil establishments consumed £105,443; ecclesiastical expenditure, £21,942; judiciary, £28,730; introduction of immigrants, £28,865; education, £27,833; public works, £21,-

568. The public debt in 1900 was £754,780. There were only 79,954 acres cultivated in 1900, of which 66,954 acres were planted to sugar-cane. The gold-mines, first opened in 1886, yielded in ten years the value of £2,796,300. In 1897 there were 126,702 ounces taken out, 125,080 ounces in 1898, 112,464 ounces in 1899, 112,823 ounces in 1900, and 108,522 ounces in 1901, in which year 906 carats of diamonds were exported, value £12,876. The total value of imports was £1,393,529, and of exports £2,068,406. The importation of flour was £123,180 in value, 179,745 barrels in quantity; cloth, £218,242; rice, £79,512; tobacco, £17,278; machinery, £77,368; fertilizers, £100,927; fish, £59,728; coal, £36,061; hardware, £48,766. The exportation of sugar was £1,153,808; molasses, £12,371; rum, £300,583; balata, £19,585; timber, £22,928; charcoal, £7,336; gold, £393,926; rough diamonds, £2,683. The tonnage entered and cleared in 1901 was 709,928. The registered shipping of the colony consisted of 33 sailing vessels, of 1,622 tons, and 15 steamers, of 1,171 tons. There are 74 miles of railroads, 559 miles of telegraph-lines and cable, and 677 miles of telephone-wire. The gold-mining industry is languishing, though alluvial gold is now mined at half the cost that the sanguine operators expended ten years ago. Hydraulic mining at Omai, on the Essequibo, may give a fresh impetus to this industry, which speculative capitalists have abandoned for diamond-mining. Americans are working the diamond deposits and German and Dutch companies the gold-mines.

British Honduras is a settlement in Central America governed as a Crown colony, having an area of 7,562 square miles and a population estimated at 36,998, divided into 18,889 males and 18,109 females. The number of births in 1900 was 1,478; deaths, 890; marriages, 339. The Governor is Sir David Wilson. The revenue in 1900 was £59,700; expenditure, £50,800; imports, £246,950; exports, £267,900. The debt in 1900 was £34,736. The export of logwood was 7,994,378 feet in 1900. Some sugar is exported and fruit to New Orleans, and in transit from Yucatan rubber, coffee, and sarsaparilla. The tonnage entered and cleared in 1900 was 340,097. The shipping registered in the colony comprised 203 sailing-vessels, of 4,480 tons, and 6 steamers, of 1,326 tons. The more important British possessions are elsewhere described (see AUSTRALIA, CANADA, EAST AFRICA, INDIA, NEWFOUNDLAND, NEW ZEALAND, SOUTH AFRICA, WEST AFRICA, WEST INDIES):

GREECE, a monarchy in southeastern Europe. The legislative authority is exercised in a single chamber called the Boule, composed of 235 members, 1 to 12,000 inhabitants, elected for four years by direct universal male suffrage. The reigning King is Georgios I, son of Prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg, now King of Denmark, born Dec. 24, 1845, elected King of the Hellenes by the National Assembly on March 30, 1863, married on Oct. 27, 1867, to Olga, daughter of the Grand-Duke Constantine of Russia. The heir apparent is Prince Konstantinos, Duke of Sparta, born Aug. 2, 1868, married on Oct. 27, 1889, to Princess Sophia, daughter of the late German Emperor Friedrich I. The Cabinet constituted on Nov. 25, 1901, was composed as follows: President of the Council and Minister of Foreign Affairs, Alexander T. Zaimis; Minister of the Interior, N. Triantaphyllakas; Minister of Worship and Education, A. Mempherratos; Minister of War and Minister of Marine, *ad interim*, Col. G. Korpas; Minister of

Finance, P. Negrís; Minister of Justice, C. Topalis.

Area and Population.—The area of Greece is 25,014 square miles. The population in 1896 was 2,433,806, divided into 1,266,816 males and 1,166,990 females. Athens, the capital, had 111,486 inhabitants. The chief political divisions are nomarchies, the number of which was increased by the law of July 17, 1899, from 16 to 26: Attica, Boeotia, Phthiotis, Phocis, Ætolia and Acarnania, Eurytania, Larisa, Magnesia, Trikkala, Karditsa, Arta, Achaia, Elis, Triphylia, Messenia, Lacedæmon, Laconia, Arcadia, Argolis, Corinthia, Eubœa, Cyclades, Corfu, Leucas, Cephalonia, Zante.

Finances.—The revenue in 1900 was 112,206,849 drachmas, and expenditure 114,088,468 drachmas. For 1901 the revenue was estimated at 115,734,159 drachmas, of which direct taxes produce 23,683,300 drachmas, customs and excise 41,295,728 drachmas, stamps and dues 17,305,100 drachmas, monopolies 13,840,250 drachmas, revenue from state property 5,935,250 drachmas, sales of state property 1,231,300 drachmas, deductions, etc., 2,220,272 drachmas, various sources 5,020,000 drachmas, lighthouses 880,000 drachmas, other revenue 258,950 drachmas. The expenditures for 1901 were estimated at 113,646,302 drachmas, of which the public debt consumed 32,344,624 drachmas, pensions 6,560,343 drachmas, allowances 103,800 drachmas, various obligations 185,000 drachmas, the civil list 1,325,000 drachmas, the Boule 584,820 drachmas, the Ministry of Foreign Affairs 2,846,018 drachmas, the Ministry of Justice 6,243,573 drachmas, the Ministry of the Interior 15,140,567 drachmas, the Ministry of Worship and Education 5,392,457 drachmas, the Ministry of War 17,393,015 drachmas, the Ministry of Marine 7,129,948 drachmas, the Ministry of Finance 2,048,472 drachmas, collection of taxes 9,438,236 drachmas, various expenses 6,910,628 drachmas.

The national debt on Jan. 1, 1901, amounted to 697,554,000 drachmas in gold, 79,649,005 drachmas of paper obligations, and 91,775,975 drachmas of forced paper currency. A financial commission composed of delegates of Germany, Austria-Hungary, France, Great Britain, Italy, and Russia was established by the law of control enacted in 1898, and to this commission the revenues from monopolies, tobacco, stamps, and customs duties collected at the Piræus were assigned for the payment of interest on the foreign debt. The rate of interest was altered and provision was made for the extinction of the debt. A loan of 226,000,000 drachmas to pay the war indemnity to Turkey, redeem the floating debt in paper, and cover deficits was guaranteed by these powers, through whose diplomatic intervention peace had been arranged with Turkey. The service of the various debts in 1901 required 33,553,768 drachmas. The revenue from customs in 1900 was 30,650,776 drachmas. Of the assigned revenues the receipts from the Piræus customs were 17,468,135 drachmas in paper; from Naxos emery, 673,997 drachmas in gold; from the salt monopoly, 2,807,473 drachmas; from petroleum, 6,368,490 drachmas; from matches, 1,329,247 drachmas; from playing-cards, 311,755 drachmas; from cigarette paper, 2,620,529 drachmas; from tobacco, 8,436,719 drachmas; from stamps, 10,232,940 drachmas; total, 49,575,288 drachmas in paper and 673,997 drachmas in gold. The international commission in the year ending Jan. 13, 1902, took in 1,131,705 drachmas in gold and 58,041,476 drachmas in paper and paid out 950,004 drachmas in gold and 48,893,563 drachmas in paper. The pay-

ments in gold on the public debt amounted to 15,036,669 drachmas, of which 12,251,952 drachmas went to holders of coupons, 6,087,000 drachmas of this to England, 3,131,000 drachmas to France, and 524,229 drachmas to Greek bondholders. The mean rate of exchange was 165.

The Army and Navy.—The authorized strength of the regular army in 1901 was 61 officers and 1 man on the general staff and in the Ministry of War, 101 officers and 1,285 men in the engineer corps, 218 officers and 2,247 men in the artillery, 96 officers and 1,265 men in the cavalry, 873 officers and 9,995 men in the infantry and rifles, 355 officers and 417 men in general services, 28 officers and 75 men in military schools, and 144 officers and 3,918 men in the gendarmerie; total, 1,876 officers and 19,203 men, with 3,216 horses, 703 mules, and 180 guns. The period of service is two years with the colors and ten years in the reserve, and in case of war 82,000 men could be mobilized, and 96,000 more in the National Guard, which comprises able-bodied Hellenes between the ages of thirty-three and fifty-one.

The naval force consists of the belted cruisers *Hydra*, *Spetsai*, and *Psara*, of 4,885 tons, built in 1889 and 1890, which carry 3 10.6-inch guns in turrets and 28 smaller guns; 2 old ironclads armed with a pair of 6.6-inch Krupps and 10 small guns; 16 unprotected cruisers and gunboats; and 7 large torpedo-boats and 44 small ones. The navy was manned in 1901 by 363 officers, 40 cadets, and 3,379 petty officers, stokers, and seamen. Conscripts among the seafaring population are drafted into the navy and other sailors are enlisted.

Production and Industry.—Of the total area of Greece about 2,300,000 acres are under crops, vineyards, or orchards, 1,200,000 acres are fallow, 2,000,000 acres are forest, 5,000,000 acres are pasture, and 3,000,000 acres are unproductive. About 7,000,000 bushels of wheat, 3,000,000 bushels of barley, 2,700,000 bushels of corn, and 7,000,000 bushels of other grain are raised. Cereals occupy 1,111,500 acres; cotton is grown on 14,800 acres, and tobacco on 12,000 acres; the area under currants, the peculiar crop of Greece, on which its prosperity has largely depended, is 168,000 acres, while olives cover 432,000 acres, vineyards 336,000 acres, and figs and other fruits 52,000 acres. The average crop of currants is 150,000 tons. Under the retention law of 1895, renewed for ten years in 1899, the Government retains 10 per cent. or more of the currant-crop, which is used for wine or brandy. The crop in 1900 was 51,300 tons, of which 45,700 tons were available for export and 40,255 tons were exported. The crop of valonia was 7,700 tons. In Mesenia, where the silkworm is grown, 44,000 pounds of cocoons were produced and 37,400 pounds of silk were spun. About 8,240 tons of olive-oil soap are manufactured annually. In the Laurium district, where French capital has been invested, the mining products in 1900 included 320,245 tons of manganese ore, 171,377 tons of hematite, 18,505 tons of zinc ore, 1,552 tons of galena, and 264,614 tons of inferior lead ore yielding 16,719 tons of silver lead.

The total value of special imports in 1900 was 129,986,066 drachmas in gold; of exports, 102,089,318 drachmas. The imports of cereals were 33,594,882 drachmas in value; of tissues and yarn, 16,484,828 drachmas; of coal and minerals, 14,951,885 drachmas; of lumber, 11,142,801 drachmas; of fish and caviar, 6,166,305 drachmas; of metals and ores, 5,644,493 drachmas; of chemicals, 4,164,055 drachmas; of hides and skins,

3,388,853 drachmas; of live animals, 3,370,954 drachmas; of paper, 3,898,032 drachmas; of coffee, 2,748,584 drachmas; of sugar, 2,569,526 drachmas; of earthenware and glass, 2,020,885 drachmas; of rice, 1,642,630 drachmas; of colors, 1,294,367 drachmas. The exports of dried currants were 52,890,540 drachmas in value; of ores, 20,810,742 drachmas; of wine, 4,812,675 drachmas; of tobacco, 3,564,843 drachmas; of figs, 2,429,768 drachmas; of olive-oil, 2,344,225 drachmas; of valonia, 1,619,101 drachmas; of silk and cocoons, 1,418,140 drachmas; of sponges, 884,760 drachmas; of brandy, 709,707 drachmas; of emery, 633,088 drachmas; of gunpowder, 605,225 drachmas; of fruits, 286,782 drachmas; of olives, 281,834 drachmas; of soap, 187,530 drachmas; of cement, 181,458 drachmas.

Navigation.—During 1900 there were 5,394 vessels, of 3,113,688 tons, entered and 5,223, of 3,101,066 tons, cleared at Greek ports. The merchant navy on Jan. 1, 1901, comprised 927 sailing vessels, of 183,877 tons, and 137 steamers, of 115,530 tons.

Railroads and Telegraphs.—The length of railroads open in 1900 was 603 miles, and 300 miles were building. A line from the Piræus to the Turkish frontier, to be built with a loan of 44,000,000 drachmas guaranteed by the Government, was begun in 1902 and is expected to be completed in 1905.

The telegraph-lines, inclusive of cables, had a total length on Jan. 1, 1899, of 5,300 miles, and the length of wire was 6,200 miles. The number of despatches in 1899 was 1,771,506, of which 1,380,468 were paid internal, 25,124 official, and 365,914 international; receipts were 1,312,000 drachmas. The length of telephone-lines was 590 miles; number of conversations, 373,000.

Politics and Legislation.—The Chamber, although the Government had a majority of 132 to 51, could transact no business in the early months of the year on account of the obstruction of the Opposition, which declared the formation of the Zaimis ministry to have been unconstitutional and demanded a dissolution. The budget was voted on April 18 after the Chamber had remained in session through the night, and on April 21 the Chamber was prorogued without having dealt with the bill for army reorganization or effected any useful legislation, though for the fatigues of the debates protracted into the nights the members voted themselves extra compensation.

GUAM, the principal island of the Ladrone, or Marianne, group, a possession of the United States since 1898, used as a coaling station on the route to the Philippines. It has an area of about 200 square miles and a population of 9,000, two-thirds of whom live in Agaña, the capital. The people are descendants of immigrants from the Philippines. The island is wooded and fertile. The Governor in 1902 was Commander Seaton Schroeder, who was relieved in November by Commander W. Sewell. The property of the naval station was damaged on Sept. 22 by an earthquake that destroyed most of the masonry houses in Agaña and the other towns, inflicting heavy loss on the people of the island, who had not yet repaired the serious losses resulting from the hurricane of 1900.

GUATEMALA, a republic in Central America. The Congress is composed of a National Assembly containing 69 members, 1 to 20,000 inhabitants, elected for four years by adult male suffrage, and a Council of State of 13 members, part of whom are elected by the Assembly and part appointed by the President. The President

of the republic is elected for six years by the direct vote of the people, and is ineligible for the next succeeding term. Manuel Estrada Cabrera was elected for the term that began on Feb. 8, 1899. The Secretary of the Interior and Justice in 1902 was Juan J. Argueta; Secretary of Foreign Affairs, Juan Barrios; Secretary of War, Luis Molina; Secretary of Public Works and Agriculture, Rafael Spinola; Secretary of Finance, Guillermo Aguirre; Secretary of Public Instruction, J. A. Mandujano.

Area and Population.—The area of Guatemala is estimated at 48,290 square miles. The population in 1900 was 1,574,340. The capital is Guatemala la Nueva, which has 72,102 inhabitants, of whom over 80 per cent. are of European origin. Of the indigenous population the majority are pure Indians and the rest mostly of mixed blood.

Finances.—The ordinary revenue in 1900 amounted to \$9,139,872 in currency, and expenditure to \$11,870,667. The deficit was met by means of an extraordinary revenue of \$3,709,806, making the total revenue \$11,964,168. For 1901 the revenue was estimated at \$9,770,000, of which \$4,340,000 came from customs, \$3,760,000 from stamps and taxes, and \$1,370,000 from monopolies. The expenditure was estimated at \$9,611,200, of which \$3,157,856 were for finance and public credit, \$1,998,200 for war, \$1,513,915 for education, and \$1,421,524 for the interior and justice. The military force, which absorbs 10 per cent. of the revenue, consists of a standing army of about 7,000 officers and men.

The foreign debt was adjusted in 1895, and in 1901 the Corporation of Foreign Bondholders in London found the amount of the 4-per-cent. bonds outstanding to be £1,482,800, on which there were £29,656 of certificates of unpaid interest for £29,656 and later arrears from 1899 to 1901 amounting to £118,624, making a total of £1,631,080. There were besides £144,390 outstanding of loans raised in 1897 and 1898. The total gold debt was officially stated to be \$9,352,694. The internal debt on Jan. 1, 1901, amounted to \$28,118,068 in silver. Great Britain made a naval demonstration to enforce payment of the debt to English creditors, and on April 18, 1902, landed bluejackets at San José to suppress the threatened resistance of the people and soldiers. France and Germany also sent men-of-war to San José to demand the payment of debts.

Commerce and Production.—The total value of imports in 1898 was \$4,850,471 in gold, and of exports \$15,377,461 in currency, equal to \$4,881,730 in gold. In 1899 the value of imports

was \$4,117,659 in gold, and of exports \$8,370,556. The value of coffee exported in 1899 was \$7,390,477; of rubber, \$256,921; of hides and skins, \$267,970; of sugar, \$250,360. The public lands are offered for sale to settlers at from \$250 to \$500 per caballeria of 112½ acres. Free grants are made for school purposes or to villages or immigration companies which undertake to make roads. Under the decree of Jan. 14, 1899, every landowner who plants 20,000 rubber-trees will receive 1 caballeria of the national domain. There are plantations of cacao and tobacco, and on the seashore bananas are cultivated. About 200,000 cattle graze on the high plateaus, where there are 750,000 acres of rich pasture. Lead, tin, copper, manganese, antimony, sulfur, and lignite have been found. Salt is mined, and gold- and silver-mines have been opened.

Earthquakes occurring in succession from April 8 till April 24 did damage in all parts of the republic and destroyed Patzum, Amatitlan, San Marcos, Santa Lucia, Mazatenango, Solola, and San Felipe. Quezaltenango was left in ruins. The buildings and machinery on the plantations in the largest coffee-growing district were wrecked. Hundreds of persons were killed, and the property loss amounted to millions of dollars. On Oct. 24 the volcano of Santa Maria burst forth, covering with ashes the country for 30 miles around, the best coffee district in Guatemala. The money loss is estimated at \$5,000,000. The inhabitants were suffocated by sulfurous gases, about 7,000 in all, including the population of 10 Indian villages. Over 300,000 hundredweight of coffee was destroyed with the plantations, buildings, and cattle. Most of these properties belonged to Germans. Distress and partial famine afflicted the central and western parts of the republic as a result of the disaster. Eruptions from new craters in November extended the area of desolation. (See EARTHQUAKES AND VOLCANIC ERUPTIONS.)

Navigation.—Fruit steamers from New Orleans call at Puerto Barrios and other ports. The number of vessels entered in 1898 was 825; cleared, 815.

Railroads.—There is a line of railroad from the capital to San José, 75 miles, and a branch runs from Santa Maria to Ratulul, 33 miles, which will be carried to Mazatenango, 34 miles, to connect with a new line which is being built from Puerto Barrios to the capital, 210 miles, of which 134 miles have been completed. When the two railroads meet they will afford continuous transit between the Atlantic and Pacific coasts.

H

HAWAII. (See under UNITED STATES.)

HAYTI, a republic in the West Indies, occupying the western third of the island of Hayti. The legislative power is vested in the National Assembly, consisting of a Senate and a House of Representatives. The Senate has 39 members, chosen for six years by the lower house from lists submitted by the President and a college of electors. The members of the House of Representatives, 95 in number, are elected for three years by the votes of all adult male citizens having visible means of support. The President is elected by the National Assembly for seven years. Gen. Tiresias Simon Sam was elected on April 1, 1896, for the remainder of Gen. Hippolyte's term, expiring May 15, 1902. The Cabinet in the be-

ginning of 1902 contained the following members: Secretary of State for Foreign Affairs and War, Brutus San Victor; Secretary of Finance and Commerce, P. Faine; Secretary of the Interior and Police, Tancrede Auguste; Secretary of Agriculture and Public Works, C. Leconte; Secretary of Justice and Public Instruction, Gédéon Gédéon; Secretary of War and Marine, V. Guillaume.

Area and Population.—The area of the republic is estimated at 10,204 square miles. The population was 1,210,625 in 1894, according to an ecclesiastical enumeration. Port-au-Prince, the capital, has an estimated population of 61,000; Cape Haitien, 29,000; Les Cayes, 25,000. Of the total population about 90 per cent. are

blacks and the rest, with few exceptions, are mulattoes.

Finances.—The revenue for 1901 was estimated at \$4,198,337 in paper and \$2,536,100 in gold. The estimated expenditure was \$4,200,264 in paper and \$2,536,226 in gold, of which \$24,124 in paper and \$79,159 in gold were for the Ministry of Foreign Affairs, \$514,932 in paper and \$10,622 in gold for the Ministry of Finance and Commerce, \$1,325,870 in paper and \$12,500 in gold for the Ministry of the Interior, \$216,278 in paper and \$60,400 in gold for the Ministry of Public Works, \$222,294 in paper and \$5,000 in gold for the Ministry of Agriculture, \$600,769 in paper and \$4,885 in gold for the Ministry of Public Instruction, \$393,000 in paper for the Ministry of Justice, \$31,352 in paper and \$57,365 in gold for the Ministry of Worship, \$66,815 in paper and \$69,572 in gold for the National Bank, and \$47,819 in paper and \$2,187,143 in gold for the public debt. The debt on Jan. 1, 1901, consisted of \$12,960,642 of 5- and 6-per-cent. external gold bonds and \$9,372,183 of currency and \$6,115,091 of gold internal bonds, part of which are secured on the export duty on coffee. There were \$3,749,000 of paper money in circulation in 1899 and \$3,500,000 of silver, and there were believed to be about \$1,200,000 of American gold.

The Army and Navy.—There is a Government guard of 650 men, consisting of 1 battalion of artillery, 1 battalion of rifles, 1 regiment of infantry, and 1 squadron of cavalry. The troops of the line number 6,178, consisting of 4 battalions of artillery, 6 regiments of infantry, and 46 companies of gendarmes.

The navy in 1901 comprised 4 small cruisers and 2 gunboats. The gunboat *Crête-à-Pierrot*, of 940 tons, built in England in 1895, was capable of a speed of 15½ knots and was armed with 1 6.3-inch, 1 4.7-inch, 4 4-inch, and 6 smaller rapid-fire guns. The *Capois la Mort* was built in France in 1893. The *Toussaint l'Ouverture* was built in 1886; the *Dessalines*, of 1,200 tons, in 1883. The gunboat *22^{me}* Decembre has a displacement of 900 tons. The *1804* and *St.-Michel* are much smaller.

Commerce and Production.—The value of imports in 1900 was estimated at \$7,180,000, and that of exports at \$14,000,000, compared with \$4,312,000 for imports and \$11,800,000 for exports in 1899. The exportation of coffee reached 72,122,781 pounds in 1900; cacao, 4,656,997 pounds; logwood, 116,884,700 pounds; cotton, 2,260,000 pounds; hides, 374,800 pounds; copper, 41,500 pounds. Logwood roots, cabinet woods, honey, goatskins, and beeswax are exported. Of the imports in 1899 the value of \$2,833,192 came from the United States, \$490,510 from France, \$325,411 from Great Britain, and \$272,906 from Germany. Mining copper is an enterprise not long established. Concessions of coal and iron-mines have been granted. Gold, silver, tin, antimony, nickel, kaolin, and gypsum are found. The coffee trade is retarded and the exportation of cattle has been checked by the imposition of heavy export duties.

Navigation.—The number of vessels entered and cleared at Port-au-Prince during 1900 was 183, of 285,092 tons; at Les Cayes, 161, of 185,725 tons; at Cape Haitien, 162, of 194,360 tons.

Railroads.—Only 10 miles of railroad have been built in Hayti, running from Cape Haitien in the direction of Grande Rivière, 15 miles distant. Branches will connect the port also with Ouanaminté, 35 miles, and Limbe, 19 miles. A concession was granted in 1900 for a railroad from Port-au-Prince to Salt Lake, 50 miles, which

will be the first section of a line connecting the Haytian capital with Santo Domingo, the capital of the Dominican Republic.

Revolutionary Disturbances.—The election of a President of Hayti was not possible without a revolutionary struggle. The National Assembly had declared that Gen. Tiresias Simon Sam's term would not expire till May, 1903. The rival politicians held the view that his powers ended at the close of the regular term in May, 1902. Toward the end of March an expedition landed on the south coast, captured Barahona after a fight, marched inland when a Government gunboat bombarded and recaptured the town, and began to raise a revolutionary army. Congress decreed martial law and the suspension of constitutional guarantees throughout the republic. On May 9 President Sam resigned and took refuge on a French steamer. On May 12 the National Assembly met to choose his successor. The contest between Anténor Firmin, Maxi Monplaisir, candidate of the National party of the negroes, and other aspirants who still concealed their intentions could not be peacefully decided. As soon as Congress was opened one Deputy called for the removal of the troops in the hall, others shouted that Congress had not the confidence of the people and raised a cry for revolution, in which the soldiers joined. All then rushed to their arms and fought in the streets. A national election was announced, to take place on June 28. Meanwhile a Provisional Government was proclaimed, composed as follows: Provisional President, ex-President Boisrond Canal; Minister of War, Gen. Alexis Nord; Minister of Foreign Affairs, M. Jeremis; Minister of Finance, M. Deunéry; Minister of Agriculture, M. Césarion; Minister of the Interior, M. Saint-Foix Colin; Minister of Justice, M. Lallanes. Committees of safety were formed in every town to preserve order. Gen. Firmin with an army raised in the north marched upon Port-au-Prince expecting the adherence of the Provisional Government and the 4,000 troops, under Gen. Alexis Nord. The latter, however, transferred his allegiance to the exiled Calisthène Fouchard, who with another expedition from Kingston, Jamaica, landed at Port-au-Prince on May 17. Admiral Killick declared for Gen. Firmin and departed for the north with the two vessels that constituted the effective navy of the republic. The Firminist army under Gen. Albert Salnave marched upon Cape Haitien, where the gunboat *Crête-à-Pierrot* landed marines. Gen. Nord attempted to cut off the Firminist troops at Limbe, but was defeated by them, losing his large guns and many of his soldiers, killed and taken prisoners. At various points fights occurred between partisans of the rival candidates. The officials of Cape Haitien refused to hand over the town to Admiral Killick, whereupon he threatened bombardment. Adherents of the rival candidates fought in the streets. The foreign consuls protested against bombardment. Gen. Alexis Nord with his troops occupied the city, from which Gen. Firmin attempted to dislodge him. Admiral Killick landed troops and machine-guns on June 29, but they returned to the ships with the partisans of Gen. Firmin after an unsuccessful engagement. The United States gunboat *Machias* was the only foreign war-vessel there. Commander McCrea protested against bombardment and declared he would land sailors, if necessary, to protect American or other foreign interests if they were threatened. Admiral Killick fired some shots without effect, and then desisted. The Provisional Government was recognized by

the foreign representatives, but it was powerless to assert its authority in any of the towns. The congressional elections, wherever an attempt was made to hold them, ended in disorder and bloodshed. In the Artabonite provinces Gen. Firmin was proclaimed President, and with his army he marched once more on Port-au-Prince, while Admiral Killick again threatened to bombard Cape Haitien. The Provisional Government declared Admiral Killick a pirate and invited foreign vessels to capture him. Soon afterward the Provisional Government dissolved, its authority over the country and cohesion among its members having vanished. Civil war was declared throughout the country. The Provisional Government was afterward reconstituted, some of its former members having taken to flight. Gen. Salnave with Firminist troops advanced to attack Cape Haitien and again repulsed Gen. Alexis Nord, who marched out to meet him. Commander McCrea arrived with the *Machias*, which had been at Colon. He warned Admiral Killick against bombarding without notice. Coal for the *Crête-à-Pierrot* was seized by the Provisional Government at Port-au-Prince. Admiral Killick declared a blockade at Cape Haitien, but he did not remain there constantly with his vessel, and Commander McCrea and the foreign consuls refused to recognize a blockade. The American naval commander, who was charged with the protection of all European interests as well as those of the United States, informed Admiral Killick that the blockade was not effective and warned him against searching any foreign vessel. *Petit Goave* was entirely destroyed on Aug. 8, having been set on fire by Gen. Chicoye, the revolutionary commander, before he retreated. On Aug. 28 Gen. Nord fought another hard battle for the defense of Cape Haitien, this time with Gen. Jean Jumeau, another Firminist commander. The German merchant steamer *Marcomannia* was stopped at the entrance of Cape Haitien harbor by the *Crête-à-Pierrot*, and arms and ammunition for Gen. Nord were confiscated. The German cruiser *Panther* arrived from Port-au-Prince, pursued the Haytian vessel on Sept. 5 to Gonaïves, and there signaled to her commander to strike his flag and abandon the ship. This was done, but a powder-magazine exploded, and Commander Eckermann, instead of capturing the vessel, which was now burning, sank her by firing a shell into the other powder-magazine. Admiral Killick had fired the after magazine and went down with his ship. Gen. Firmin formed a Provisional Government at Gonaïves and appointed a Cabinet. Gen. Jumeau, his position at St.-Michel becoming untenable after he lost a small battle, burned the place to prevent it from falling into the hands of the Government. The Government troops threatened Gonaïves and St. Marc, but afterward retired, and Gen. Jumeau collected his forces and advanced toward Port-au-Prince. The representatives elected to the National Assembly met there and organized. Those whose credentials were accepted showed a majority in favor of the election of Senèque Pierre to the presidency, and his opponents endeavored to defeat him by absenting themselves, so that there was no quorum for the election of Senators. Exiled and proscribed persons departed on every foreign steamer. The delay in the election of a President was approved by men of all parties, who wished to await the result of the impending battle between the forces of Gen. Alexis Nord and Gen. Jumeau, who confronted each other again, each with about 3,000 men. They met at Limbe, and after a battle lasting

two days, in which both sides lost heavily, Gen. Nord retreated. The Provisional Government declared the ports of Gonaïves, St. Marc, and Port-de-Paix, held by the Firminists, closed, but this the United States Government would not allow in the absence of a blockade. Gen. Chicoye was taken and executed for burning *Pétit Goave*, causing the death of numerous non-combatants. On Sept. 17 Gen. Nord advanced on Gen. Jumeau's position at Limbe, and was again forced to retire with loss. He returned in greater force on Sept. 27, defeated the Firminists, and captured the town. In October the Government forces, with the aid of an armed steamer, the *Nouvelle Voldroque*, attacked the Firminists at Montrouis, near St. Marc, but were repelled and their vessel was sunk. Gen. Saint-Foix Colin called the people of Port-au-Prince to arms and advanced with a stronger force for a second attack. St. Marc capitulated on Oct. 14, and Gen. Firmin with 250 of his followers took refuge on a German steamer. Gonaïves surrendered on Oct. 17, without fighting, on terms arranged by the mediation of the foreign consuls. American marines from the Cincinnati and French and German marines were at Gonaïves, all the Firminist officials having fled, when the Government troops entered on Oct. 18. Gen. Alexis Nord, who was now a strong candidate for the presidency, remaining at St. Marc with the main body of the army, sent a demand to Port-au-Prince for the expulsion of all Firminist Deputies from Congress. The Fouchardists who returned to the capital from the campaign came into collision with the authorities. A quorum of Congress could not be brought together to take any action. Deetjen Senekist, president of the Chamber, and Calisthène Fouchard had many partisans to urge their claims. Other candidates who were before prominent had few, and the adherents of Gen. Alexis Nord were the most numerous and powerful. On Dec. 14 Gen. Nord entered the capital at the head of his army and was acclaimed by the people.

HOLLAND. (See NETHERLANDS.)

HONDURAS, a republic of Central America. The Congress is a single chamber of 45 members, elected for four years by universal adult male suffrage. The President of the republic is elected likewise by the direct vote of the nation for four years. The President for the term beginning Feb. 1, 1899, is Gen. Terencio Sierra. The Vice-President is Gen. José M. Reina. The ministry was composed in 1902 of the following members: Minister of Foreign Affairs, Dr. C. Bonilla; Minister of Public Works, F. Altschul; Minister of Justice and Public Instruction, Dr. Juan A. Arias; acting Minister of the Interior, Dr. Bonilla; Minister of Finance, D. Fortin; Minister of War, Gen. M. Rosales.

Area and Population.—The area is estimated at 46,250 square miles. The population in 1900 was estimated at 587,500, exclusive of uncivilized Indians. The mass of the population is of the Indian race. The few whites are descendants of Spanish settlers. Tegucigalpa, the capital, has 12,000 inhabitants.

Finances.—The revenue in 1900 was \$2,842,005 in silver; expenditure, \$2,629,815. The revenue for 1901 was estimated at \$2,423,000, and expenditure \$2,416,824; for 1902, revenue and expenditure at \$2,629,050. Revenue from customs in 1902 was estimated at \$1,100,000; from the spirit monopoly, \$800,000. Expenditure for the army was estimated at \$953,473; for public works, \$433,900; for the Interior Department, \$432,742.

A loan of £78,800 sterling was contracted at 5 per cent. in 1867, and one of £900,700 at 10

per cent. interest, in 1869 a loan of £2,176,570 at 6½ per cent., and in 1870 one of £2,242,500 at 10 per cent.; total capital, £5,398,570, on which no interest has been paid since 1872, so that the arrears amounted on June 30, 1901, to £13,363,052. The internal debt on June 30, 1900, amounted to \$1,800,812 in silver.

Commerce and Production.—The most profitable industry is growing bananas in the coast region for export to the United States. Tobacco, sugar, and coffee are cultivated; indigo, rice, and wheat also on a limited scale, and corn extensively. Large numbers of cattle are reared, and in a small way dairying is carried on. The plaiting of hats is a common occupation. The agricultural possibilities of the country are great, but development is slow on account of the scarcity of good laborers. For the same reason and for lack of transportation there is little mining enterprise, although gold, platinum, silver, copper, lead, zinc, antimony, nickel, and iron are found

in many places. Coal deposits have also been discovered. The value of imports in the year ending June 30, 1900, was \$1,074,050, and that of exports £2,635,600. The exports of metals were \$803,920; bananas, \$720,680; cattle, \$571,980; wood, \$146,854; coffee, \$45,510. The United States furnished 72 per cent. of the imports and took 64 per cent. of the exports.

Railroads, Posts, and Telegraphs.—The railroad from Puerto Cortez to La Pimienta, 60 miles, was built for the Government by English contractors who undertook to carry the line from ocean to ocean, but stopped when the Government could raise no more money. A railroad through the banana districts from Omoa to Truxillo has been contracted for.

There were 337,589 domestic and 200,548 foreign letters despatched in 1898. The length of telegraph-wire in 1899 was 2,730 miles.

IDAHO. (See under UNITED STATES.)

ILLINOIS. (See under UNITED STATES.)

INDIA, an empire in southern Asia under the sovereignty of the King of Great Britain and Ireland, who bears the title of Emperor of India, on the basis of a personal union. The empire is governed under general acts of the British Parliament by a Governor-General in consultation with and under instructions from the Secretary of State for India, a member of the British Cabinet. The Governor-General, popularly called the Viceroy, is advised by his Council, containing 5 ordinary members appointed for five years. The commander-in-chief of the forces is a member *ex officio*. The members of the Governor-General's Council and 16 additional members, appointed by the Governor-General on the recommendation of certain public bodies, form the Legislative Council, which has power to make laws, subject to the approval of the Governor-General and to the veto of the British Government, for all persons in British India, for British subjects in native states, and for native Indian subjects of the King in foreign countries. British India is divided for purposes of administration into the presidencies of Madras and Bombay, each of which has a governor at the head of the local provincial administration; the lieutenant-governorships of Bengal, the Northwest Provinces and Oudh, the Punjab, and Burma; and the chief-commissionerships of Assam and the Central Provinces. Coorg, Ajmere and Merwara, British Baluchistan, and the Andaman Islands are minor chief-commissionerships. Each Governor and Lieutenant-Governor has his Legislative Council. The 9 provinces are subdivided into about 250 districts, each in charge of a collector-magistrate or deputy commissioner. These officers, responsible to the governor of the province, in their districts have absolute authority, and in many the district magistrate's executive and judicial functions are united. The new Northwestern Frontier province was established on Nov. 9, 1901, with Peshawur as the seat of the administration. It embraces Peshawur, Kohat, Bannu, and Dera Ismail, districts of the Punjab lying beyond the Indus, with the whole of the Hazara district and the agencies of Swat, Chitral, the Khaiber and Kurram passes, Tochi, and Wana, and is under the administration of an agent to the Governor-General, Lieut.-Col. H. A. Deane.

The Governor-General of India is George Nathaniel Curzon, eldest son of the Earl of Scarsdale, born Jan. 11, 1859, created Baron Curzon of Kedleston on his appointment to the governor-generalship in September, 1898. The members of the Governor-General's Council in the beginning of 1902 were as follow: Major-Gen. Sir R. E. Elles, Sir C. M. Rivaz, Sir Edward Fitzgerald Law, Thomas Raleigh, A. T. Arundel, and D. Ib-betson. The Governor of Madras was Lord Ampt-hill; Governor of Bombay, Lord Northcote; Lieutenant-Governor of Bengal, Sir J. Woodburn; Lieutenant-Governor of the Northwest Provinces and Chief Commissioner of Oudh, Sir J. J. D. La Touche; Lieutenant-Governor of the Punjab, Sir C. M. Rivaz; Lieutenant-Governor of Burma, Sir F. W. R. Fryer.

Enclosed in British territory or on the borders are native states whose rulers are controlled by the Indian Government through residents or political agents. The degree of interference in their internal affairs varies, but no chief of a native state is permitted to enter into diplomatic relations with other chiefs or with foreign nations or make war or to maintain a military force exceeding a specified limit; nor can any European reside at his court without the permission of the Indian Government; and in cases of misgovernment the Indian Government exercises the right of dethroning the native ruler. An annual tribute is paid by some of the native chiefs, all of whom are nominally tributary, though in many cases no payment is required.

Area and Population.—The area of the British provinces and their population, according to the preliminary returns of the census of March 31, 1901, are given in the table on page 333.

The Berars are a native state under British administration provisionally. The total population consisted of 117,440,652 males and 113,644,480 females.

The area of the native states, groups of states under a political agent, and their population according to the preliminary census reports are given on page 333.

Of the states of Rajputana, Jodhpur, with an area of 34,963 square miles, has 4,937,220 inhabitants; Bikaner, area 22,340 square miles, has 2,278,273; Udaipur, area 12,753 square miles, has 3,750,000; Jaipur and feudatories, area 15,579

square miles, have 6,623,858; Alwar, area 3,144 square miles, has 2,743,556; Kota, area 3,784 square miles, has 2,441,420; Bhartpur, area 1,982 square miles, has 2,751,728. In Central India, Indore, area 8,400 square miles, has about 7,600,000 population; Rewa, area 12,676 square miles, has 1,600,000; Bhopal, area 6,997 square miles, has 4,000,000; and Gwalior, area 29,047 square miles, has 14,048,996. Of the Bombay states, Cutch, with an area of 6,500 square miles, has 3,050,000 population; Kolhapur and dependencies, area 2,855 square miles, have 4,100,614; Khairpur, in Sind, area 6,109 square miles, has 1,212,715. In Madras, Travancore, area 6,730 square miles, has a population of 8,823,223; Cochin, area 1,362 square miles, has a population of 1,926,294. In the Central Provinces the principal state is Bastar, with an area of 13,002 square miles and a population of 291,020. Of the Bengal states, Kuch Behar, area 1,307 square miles, contains a population of 2,164,490. The state of Rampur, in the Northwest Provinces, on an area of 945 square miles has 2,982,177 inhabitants. In the Punjab, Patiala, with an area of 5,412 square miles, has a population of 6,826,222; Kapurthala, 598 square miles in extent, has about 2,000,000; Bahawalpur, area 1,500 square miles, has 1,800,000. The birth-rate in Bengal for 1900 was 38.68 per 1,000 and the death-rate 36.63; in the Northwest Provinces and Oudh the birth-rate was 40.34 and the death-rate 31.13; in the Punjab the birth-rate was 41.1 and the death-rate 47.7; in the Central Provinces the birth-rate was 31.87 and the death-rate 57.82; in Lower Burma the birth-rate was 38.37 and the death-rate 27.51; in Assam the birth-rate was 34.96 and the death-rate 30.64; in Madras the birth-rate was 31.8 and the death-rate 23.4; in Bombay the birth-rate was 26.87 and the death-rate 70.07. The number of coolie emigrants from India in 1900 was 17,166. The population of the principal cities of India in 1901 was, according to the provisional census returns, as follows: Calcutta, 1,121,664, including suburbs; Bombay, 770,843; Madras, 509,397; Haidarabad, with suburbs, 446,291; Lucknow, 263,951; Rangoon, 232,326; Delhi, 208,385; Benares, 203,095; Cawnpur, 197,000; Agra, 183,300; Mandalay, 182,498; Allahabad, 175,748; Amritsar, 162,548; Bangalore, 159,550; Jaipur, 159,030; Howra, 157,847. The Brahminic Hindus, who were the most numerous element in the famine-stricken population, declined in numbers between 1891 and 1901 from 207,689,000 to 207,075,000. The diminution was in males alone, and it occurred in native states, while in British India, despite a falling off of 1,120,000 in Bombay and the Central Provinces, there was a net increase of 3,400,000, which was more than counterbalanced by a decrease of 4,013,000 in the native states, half of it in Rajputana. The Mohammedans in ten years increased in

numbers from 57,321,100 to 62,458,000, or 9 per cent. The growth is attributed in part to the relative prosperity of the regions where Mohammedans reside and in part to conversions. In Bengal they increased twice as fast as Hindus. Buddhists increased from 6,888,000 to 9,184,000, or 33 per cent. Their increase in Burma outstripped the rapid growth of the population as a whole. In India proper there are only 287,000 Buddhists. The Sikhs, who dwell in native states and in the Punjab, increased by 287,000 to 2,195,000. The Jains, living in Bombay and Rajputana, were reduced from 1,417,000 to 1,334,000. The animistic or pagan tribes of the hill country in Bengal and Assam, the Central Provinces and central India, Madras, Baroda, and Burma, numbered 8,584,000, a reduction of 696,000 from the former census. The Christian population increased in this year to 2,923,000, the Parsees from 89,900 to 94,200, the Jews from 17,194 to 18,228. The reformed Hindus of the Brahmo-Somaj number only 4,000, while the Orya Hindus, another new sect of Brahmans not a quarter of a century old, have grown to 67,000. Of the total population 70 per cent. are Hindus, 21 per cent. Mohammedans, 3 per cent. Buddhists, 3 per cent. animists, 3 per cent. Christians, etc.

Finances.—The total revenue of British India in the year ending March 31, 1900, was 1,029,557,468 rupees, and the total expenditure was 987,938,121 rupees, of which 742,045,431 rupees were expended in India and 245,892,690 rupees in England. The revenue for 1901, according to the revised estimates, was 1,127,490,500 rupees, and the expenditure 1,102,884,500 rupees. For 1902 the budget estimate of revenue was 1,082,878,000 rupees, of which 272,559,000 rupees were land revenue, 276,414,000 rupees railroad receipts, 89,068,000 rupees salt revenue, 68,140,000 rupees revenue from opium, 50,209,000 rupees stamp-duties, 59,506,000 rupees excise duties, 40,839,000 rupees provincial rates, 47,821,000 rupees customs duties, 19,559,060 rupees assessed taxes, 18,817,000 rupees forest revenues, 4,521,000 rupees registration dues, 9,613,000 rupees tribute, 10,235,000 rupees interest, 33,074,000 rupees revenue from the post-office, telegraphs, and mint, 18,146,000 rupees receipts of the civil departments, 8,606,000 rupees miscellaneous receipts, 37,298,000 rupees receipts from irrigation works, 6,606,000 rupees receipts from other public works, and 11,847,000 rupees receipts of the military department. The budget estimate of expenditures for 1902 was 1,075,254,000 rupees, of which 2,740,000 rupees were charged to provincial balances, leaving expenditure of the Indian exchequer 1,072,514,500 rupees. Of the total expenditure the railroads took 278,886,500 rupees; the army services, 257,030,500 rupees; civil salaries, etc., 171,883,000 rupees; costs of collection, 97,922,000 rupees; miscellaneous civil charges, 61,987,000 rupees; irrigation, 36,082,000 rupees; other public works, 72,871,000 rupees; the post-

office, telegraphs, and mint, 33,477,000 rupees; interest, 31,490,500 rupees; refunds and compensation, 18,625,000 rupees; and the famine insurance fund, 15,000,000 rupees. The capital expenditure on railroads and irrigation works, which is not included in the accounts of revenue and expenditure, was 27,750,000 rupees in 1901 and 40,291,500 rupees in 1902. In addition to this 88,836,000 rupees were applied in 1901 to the redemption of the debentures of the Great Indian Peninsula Railroad, which was transferred to the Government on June 30, 1900.

The debt of British India on March 31, 1900, amounted to 3,066,652,854 rupees, of which 1,124,747,010 rupees were permanent debt in India, 1,794,666,015 rupees permanent debt in England, and 147,239,829 rupees unfunded debt. The total has increased in ten years from 2,184,260,690 rupees.

One of the main causes of famine in India has been supposed to be the land tax. The Government in 1902 promised to allow for improvements, to make no assessments on prospective values, to revise local taxation, to impose large enhancements only by degrees, to adjust collections to the variations of crops and the circumstances of the people, to reduce assessments in declining localities. No change of system was considered necessary, and the land revenue was officially reported to be more lenient now than at any former period. The development of industrial resources is held by the Government to be the best safeguard against famine, and therefore it is intended to devote a part of the surplus to promote industry.

The capital outlay for 1903 is £9,809,000, consisting of £8,152,000 of direct expenditure on railroads and irrigation works, £979,000 of deposits and advances, £341,000 advanced to companies by the Imperial and provincial governments, and the difference between £16,837,000 paid on Council bills and £16,500,000, the amount drawn. The addition to the permanent debt for the year is £1,041,000, of which £1,000,000 was raised in India; increase of unfunded debt, £543,000; capital raised through companies for state railroads, £2,200,000; deposited by railroad companies, £1,613,000; imperial surplus, £838,000; remittances, £562,000; reduction of cash balances, £3,011,000; leaving balances of £14,883,000 in India and England on March 31, 1903. The expenditure for railroad construction is estimated at £7,334,000, and for irrigation the sum appropriated is £927,000. Two-thirds of the surplus was devoted to the building of railroads, the rest to reimbursing provincial treasuries for their losses from famine, while the collections of arrears of land revenue from the famine-stricken districts, already suspended for the years of total drought, were written off as a permanent loss to the treasury. The grants to the provincial governments, to be spent largely upon education, amounted to £866,000, remission of arrears of land revenue to £1,320,000.

Currency.—The money standard was the silver rupee from 1835 till 1893. When the price of silver bullion fell below 39*d.* an ounce and the exchange value of the rupee below 1*s.* 3*d.* the Government on June 26, 1893, closed the mints to the free and unrestricted coinage of silver for the public. Gold coin and bullion was received at the mints in exchange for rupees at the ratio of 1*s.* 4*d.* per rupee or 15 rupees for the English sovereign. On Sept. 15, 1899, the gold sovereign was declared legal tender in India and the mints were opened for the free coinage of gold. The amount of silver and copper coined from 1835 down to March 31, 1901, was 4,030,695,874 rupees. This includes 92,496,821 British dollars coined since

1894 at Bombay and Calcutta for the Straits Settlements and Hong-Kong, of the value of 209,883,703 rupees. The coinage of silver by the Government, aside from these dollars, almost ceased until the recent famine came. In the year ending March 31, 1897, the coinage of silver was 19,655,830 rupees, of which 13,922,299 rupees represent British dollars; in 1898 it was 58,157,750 rupees, including 48,300,826 rupees in the form of dollars; in 1899 it was 55,872,480 rupees, of which 48,888,833 rupees were in dollars; in 1900 it was 92,018,798 rupees, of which 69,759,048 rupees were in dollars; in 1901 it rose to 194,136,972 rupees, the heaviest coinage of any one year since the mints were established, the value of the British dollars included in this amount being 21,488,248 rupees.

The Army.—The established strength of the military forces as provided in the estimates for the year ending March 31, 1900, was 228,887 of all ranks, comprising 73,638 British and 155,249 native Indian troops. The British army in India consisted of 346 staff-officers, 4 cavalry and 31 infantry generals, 26 general officers unemployed, 509 officers and 13,198 men of the royal artillery, 211 officers and 5,355 men of the cavalry, 324 officers and 171 men of the royal engineers, 1,277 officers and 52,174 men in the infantry regiments, and 5 officers and 7 men belonging to the veteran and invalid establishment. The native army consisted of 4,010 artillery, 25,316 cavalry, 3,904 sappers and miners, and 122,019 infantry, including 61 European officers in the artillery, 482 in the cavalry, 64 in the sappers and miners, and 1,561 in the infantry. The number of European and Eurasian volunteers on May 1, 1901, was 30,830 enrolled, of whom 26,583 were counted as efficient. The Imperial Service Corps, consisting of picked contingents from the armies of the native chiefs trained by 19 British officers, numbered 16,451 in 1901, comprising 6,399 cavalry, 298 artillery, and 9,754 infantry. In October, 1902, Lord Kitchener succeeded Gen. Sir A. Power Palmer as commander-in-chief. The Indian army has been rearmed with a quick-firing rifle, transport has been organized, the present system of frontier defense is regarded as vastly superior to the schemes that preceded it, the artillery has been rearmed, and factories have been established to supply munitions and materials of war. The reduction of the army to the extent of the troops lent to Great Britain for the South African War saved for the Indian Government the sum of £2,180,000, which was applied to military reorganization and equipment. India sent 13,200 British officers and men to South Africa, with 9,000 natives, principally followers, and to China were sent 1,300 British officers and men, 20,000 native troops and 17,500 followers.

Commerce and Production.—Out of 732,285,223 acres surveyed in British and native territory reports were made of 545,069,496 acres in 1900, of which 65,843,924 acres were forest, 135,506,014 waste, 106,404,704 acres available land not cultivated, 57,163,761 acres fallow, and 180,151,093 acres bearing crops. The area under rice was 72,808,952 acres; under wheat, 16,104,779 acres; under other grains, 75,965,064 acres; under oil-seeds, 10,327,641 acres; under cotton, 8,375,841 acres; under sugar-cane, 2,693,029 acres; under indigo, 1,046,434 acres; under tobacco, 915,321 acres; under tea, 493,187 acres; under jute, 2,070,668 acres; under other fibrous plants, 404,478 acres; under coffee, 132,565 acres. Reckoning double land cropped twice in the year, the total area under crops was 203,895,561 acres, of which 33,096,031 acres were irrigated. The actual surface irrigated was 18,611,106 acres, of which 11,409,528 acres were ir-

rigated by major works, which paid a revenue of 87,723,507 rupees, and 7,201,578 acres by minor works, realizing a revenue of 86,534,306 rupees. The irrigation works, for which a capital account is kept, paid 6.10 per cent. on their capital in 1899 and 1900. The value of the crops that they irrigated is estimated at 460,000,000 rupees.

There were 190 cotton-mills in 1901, with 4,932,002 spindles and 40,542 looms, employing on the average 156,039 persons, with 165,304,591 rupees of capital invested; 35 jute-mills, having 315,204 spindles and 15,242 looms, employing 110,462 persons, in which the capital investment was 54,060,000 rupees; 4 woollen-mills, with 22,088 spindles and 504 looms; and 8 paper-mills, employing 4,871 persons, having a capital of 7,022,000 rupees, and producing 46,800,000 pounds of paper in 1900, valued at 8,251,748 rupees. The quantity of beer brewed in 1900 was 4,961,666 gallons. The output of coal from 296 mines was 6,118,692 tons, valued at 20,146,222 rupees. The number of persons employed in the mines was 80,198. The imports of coal and coke in 1901 were only 127,318 tons, including pressed fuel.

The total value of imports by sea in the year ending March 31, 1901, was 1,064,713,514 rupees, an increase of 9.56 per cent. on the imports of the preceding year; total value of exports by sea, 1,216,908,103 rupees, an increase of 4.23 per cent. The value of imports comprised 806,945,896 rupees of merchandise and 245,767,618 rupees of treasure; the total value of exports comprised 1,077,634,157 rupees of merchandise and 142,273,946 rupees of treasure. Excluding Government stores and treasure, the imports were 762,778,853 rupees of merchandise and 164,636,080 rupees of treasure, a total of 927,414,933 rupees; and the exports were 1,074,138,798 rupees of merchandise and 74,744,551 rupees of treasure, a total of 1,148,883,349 rupees. The exports of domestic merchandise were 1,042,053,484 rupees; foreign merchandise reexported, 32,085,314 rupees. The imports of merchandise and treasure, excluding Government stores and treasure, into Bengal were 376,184,296 rupees, and exports from Bengal 557,818,808 rupees; in Burma the imports were 69,915,067 rupees, and exports 100,817,147 rupees; in Madras the imports were 74,212,132 rupees, and exports 120,064,963 rupees; in Bombay the imports were 361,132,423 rupees, and exports 336,286,061 rupees; in Sind the imports were 46,971,013 rupees, and exports 33,907,292 rupees. Excluding Government stores, imports of live animals in 1901 were 4,873,197 rupees in value, and exports 2,187,491 rupees; imports of articles of food and drink were 120,725,412 rupees, and exports 263,045,344 rupees; imports of hardware and cutlery were 18,414,739 rupees, and exports 226,007 rupees; imports of metals were 64,314,863 rupees, and exports 4,335,292 rupees; imports of machinery were 22,575,592 rupees, and exports 6,747 rupees; imports of railroad materials and rolling-stock were 13,411,195 rupees, and exports 162,349 rupees; imports of chemicals, drugs, and colors were 22,256,241 rupees, and exports 128,883,296 rupees; imports of oils were 37,570,196 rupees, and exports 6,565,180 rupees; imports of raw materials were 37,075,368 rupees, and exports 427,160,535 rupees; imports of textile fabrics and yarns were 339,011,763 rupees, and exports 139,023,482 rupees; imports of clothing were 15,397,776 rupees, and exports 2,019,814 rupees; imports of other articles were 67,152,519 rupees, and exports 67,537,947 rupees; total imports of private merchandise, 762,778,853 rupees; total exports of private merchandise, 1,042,053,484 rupees.

The value of cotton goods imported was 206,

363,421 rupees; of sugar, 60,562,163 rupees; of silk, raw and manufactured, 26,827,510 rupees; of woollen goods, 21,125,756 rupees; of liquors, 10,100,004 rupees; of grain and pulse, 9,560,291 rupees; of dyes and tanning materials, 6,761,936 rupees; of glass, 7,551,762 rupees; of spices, 8,791,064 rupees; of salt, 5,660,075 rupees; of coal, 3,067,462 rupees; of paper, 4,529,966 rupees; of umbrellas, 2,700,332 rupees. The exports of rice were 132,191,491 rupees in value, of which Burma furnished the value of 79,242,788 rupees, Bengal 43,865,982 rupees, Madras 5,147,545 rupees, Bombay 3,163,806 rupees, and Sind 771,310 rupees. The exports of wheat were only 300,832 rupees. Opium exports amounted to 101,274,007 rupees, 61,224,355 rupees coming from Bengal and 33,330,002 rupees from Bombay. The value of seeds exported was 90,140,351 rupees, of which 41,707,023 rupees came from Bengal, 40,990,484 rupees from Bombay, and the rest mainly from Sind and Madras. The exports of indigo were 21,359,808 rupees, of which 15,689,574 rupees came from Bengal, 3,925,851 rupees from Madras, and the rest from Bombay and Sind. Cotton exports amounted to 101,274,007 rupees, of which 60,096,726 rupees were Bombay produce, 15,306,228 rupees came from Madras, 10,281,663 rupees from Sind, 5,990,757 rupees from Bengal, and Burma exported the value of 569,633 rupees. The value of cotton manufactures exported was 57,029,566 rupees; of raw jute, 108,677,562 rupees; of jute manufactures, 108,677,562 rupees; of raw wool, 9,029,944 rupees; of wool manufactures, 2,964,332 rupees; of hides and skins, 114,626,371 rupees; of dyes and tans, 5,940,106 rupees; of lac, 10,853,970 rupees; of raw silk and cocoons, 5,122,057 rupees; of silk manufactures, 1,254,447 rupees; of oils, 6,565,180 rupees; of tea, 96,509,301 rupees, of coffee, 12,284,496 rupees; of spices, 5,415,153 rupees; of sugar, 1,709,504 rupees; of wood, 10,706,080 rupees; of saltpeter, 3,305,324 rupees; of provisions, 5,775,562 rupees. The imports of gold bullion and specie on Government and private account during the year ending March 31, 1901, amounted to 118,980,197 rupees, and exports to 110,558,846 rupees; imports of silver were 126,787,421 rupees in value, and exports 31,715,100 rupees. The values in rupees of merchandise imports from and exports to various countries during the year ending March 31, 1901, are given in the following table:

COUNTRY.	Imports.	Exports.
Great Britain...	104	228,775,507
China...	80	117,488,180
Germany...	110	16,087,100
Straits Settlements...	20	60,081,000
United States...	40	78,170,149
France...	80	56,881,000
Belgium...	94	26,479,287
Austria-Hungary...	91	27,074,883
Egypt...	79	48,080,408
Ceylon...	70	47,897,878
Italy...	72	20,989,679
Mauritius...	52	12,081,100
Russia...	80	3,498,577
Japan...	74	30,645,986
Australia...	91	18,109,871
East Africa...	80	12,079,008
South America...	40	18,164,489
Arabia...	60	3,704,689
Peru...	71	3,161,966
Netherlands...	61	4,829,004
Spain...	88	4,445,760

Of the total sea-borne commerce for 1901, exports and imports, Calcutta had 860,184,677 rupees; Bombay, 535,083,953 rupees; Rangoon, 139,692,716 rupees; Madras, 110,093,034 rupees; Karachi, 78,794,651 rupees; Tuticorin, 24,861,687 rupees. Of the merchandise 620,867,039 rupees of imports and 606,257,737 of exports passed through

the Suez Canal. The total value of the coasting-trade, imports and exports, was 835,159,862 rupees, exclusive of Government stores and treasure. The overland trade had a total value of 118,410,481 rupees, the imports of merchandise by the land frontiers being 64,148,758 rupees, and exports 54,261,723 rupees.

In the year ending March 31, 1902, the imports were 75,000,000 rupees more in value, and the exports, 165,000,000 rupees in excess of those of the previous year, though prices were lower. Grain imports decreased, owing to diminution of the famine areas. There was a growth of the import trade in cotton piece goods and yarn, copper, silver, sugar, petroleum, matches, and cigarettes, and in machinery, steel, coal, dyes, and other imports for industrial purposes. Cotton goods from Lancashire constitute over a third of the total imports of India and a third of England's cotton manufactures. The United States and the Continent of Europe furnish special classes of cotton goods, but the amount compared with English imports is small. The total imports of cotton manufactures in 1902 were £21,930,000 in value, 40 per cent. of the total imported merchandise. The value of metals and metal manufactures was £8,769,000, 15 per cent. of the total; and in steel, which tends to supplant iron, England finds Belgium a serious rival, and Germany one in hardware and cutlery. Sugar imports were larger in all the provinces except Burma. The average imports of refined sugar from 1890 on were 2,358,000 hundredweight, 539,000 hundredweight of it bounty-fed, till 1899, when the total imports rose to 3,765,000 hundredweight, the bounty-fed sugar to 1,510,000 hundredweight. In that year a countervailing duty was imposed, and in 1900 the total imports declined to 2,936,000 hundredweight owing to famine, the bounty-fed to 840,000 hundredweight. In 1901 the total rose to 4,842,000 hundredweight, the bounty-fed to 1,740,000 hundredweight; in 1902 the total increased to 5,429,000 hundredweight, of which 2,850,000 hundredweight was bounty-fed, 2,258,000 hundredweight from Austria, and 577,000 hundredweight from Germany, while cane-sugar from Mauritius, owing to a less abundant crop, fell off from 2,085,000 hundredweight in 1901 to 1,759,000 hundredweight, which was still above the average. The countervailing duty averaged 1s. 6d. per hundredweight, yielding £270,000 of revenue to the Government. Before the sugar conference at Brussels had concluded a compact to abolish bounties the countervailing duties were increased to 4s. 4d. on Austrian and 3s. 10d. on German sugars in order to counteract the cartels and stimulate Indian production. In Behar modern central factories have been erected. Nine-tenths of the sugar consumed in India is produced within its confines, but methods of cultivation and manufacture are an age behindhand.

Petroleum, fourth in magnitude among imports, was imported to the extent of 100,000,000 gallons, the trade being partly speculative. Russia sent 84,000,000 gallons, an increase of 25 per cent.; the United States less than 6,000,000 gallons, an increase of 12 per cent. The production of crude oil in Burma rose from 19,000,000 gallons in 1898 to 50,000,000 in 1901. German woolens, Austrian and Belgium glass, and Austrian and German paper are supplanting British, and aniline and alizarine from Europe are displacing natural Indian dyes. American manufactures of shoes, bicycles, tools, hardware, sewing-machines, furniture, agricultural implements, pumps, electrical machinery, etc., are beginning to establish direct trade relations with India. The total exports of merchan-

dise in 1902 were 16 per cent. more in value than in the preceding year. The cotton factories were busy again after a long period of inactivity. Jute manufactures showed continued progress. Oil-seeds were the leading export, amounting to £11,186,000, the trade having revived after several years of depression. The linseed exports were 50 per cent. greater in quantity than in 1901, although Argentine linseed competes now with Indian. A heavy crop in the Punjab enabled India to export four times as much rape-seed as in the previous year. Earthnuts, after a series of bad crops, were exported in large quantities, and exports of cotton-seed increased from 225,000 to 2,036,000 hundredweight. The crops of gingelly, poppy, and castor were also abundant, but in 1902 the crops of oil-seeds were generally poor. Rice exports increased rapidly till 1895, but since then there has not been much surplus for export, and 70 per cent. of what there is comes from Burma. The wheat harvest in 1901 was poor except in Sind, which furnished the whole of the export of 67,000 tons, and in 1902 the harvest again averaged low. The jute-crop was heavy and 14,755,000 hundredweight was exported, half of it to England and the rest to the United States, France, and Germany. In 1902 the crop was poor, not much exceeding the requirements of Indian mills, which manufacture as much as the European mills. Jute and its manufactures taken together form the most important of India's exports. Gunny-bags, over 230,000,000 in number, were exported to Australia, Great Britain, China, the United States, Singapore, Chile, and Germany, and 419,000,000 yards of cloth, of which the United States took 273,000,000 yards. Exports of raw cotton amounted to 5,700,000 hundredweight, which went to Japan, Germany, Italy, and China. Cotton manufactures in Bombay recovered from a long depression, and exports of yarn rose from 118,000,000 pounds in 1901 to 272,000,000 pounds in 1902, of which 95 per cent. went to China, constituting more than half the requirements of the Chinese mills, while Japan furnished a fifth and China the rest. The raw skins exported went mainly to the United States, hides to Germany and other countries, leather and dressed skins to England. Poor seasons and the competition of the cheaper drug of western China reduce the exports of opium. The indigo-crop was poor and the area in Bengal was reduced two-fifths on account of the competition of artificial indigo, but in Madras there was a larger crop. Shipments, having averaged 148,000 hundredweight, declined to 102,000 hundredweight in 1901 and less than 90,000 hundredweight in 1902. Exports of tea were 180,000,000 pounds, 10,000,000 pounds less than in 1901, with lower prices. Overproduction brought on a crisis which the planters try to overcome by reducing the output of common grades, improving qualities by finer plucking, and promoting the demand both in India and in foreign countries, where Ceylon tea makes more headway at present. India exports coal to Ceylon, Aden, and Singapore, and only Indian coal is used now on the railroads. Shellac goes to the United States in greater quantity than to any other country. Coffee, small in quantity, though good, goes to England and France, but the price declined. Tobacco is grown and exported in increasing quantities in the manufactured and the raw state. Exports of hemp increase. Pepper advances in quantity and value. Manganese ore is preferred to the Russian, and the foreign demand is growing. Exports of raw silk increased in 1902, and France took over half. Silk goods, wool, shawls, rugs, and teak show a

decrease. The Government operations in the precious metals were small compared with the abnormal transactions of 1901, but private imports of silver increased.

Navigation.—The number of vessels in the foreign trade entered at the ports of British India during the year ending March 31, 1901, was 4,232, of 4,225,242 tons, of which 2,000, of 3,333,480 tons, were British; 622, of 92,236 tons, British Indian; 969, of 59,386 tons, native; and 641, of 740,140 tons, foreign. The total number cleared was 4,070, of 4,044,188 tons, of which 1,935, of 3,197,027 tons, were British; 587, of 88,981 tons, British Indian; 958, of 58,695 tons, native; and 590, of 699,485 tons, foreign. The number arriving by way of the Suez Canal was 531, of 1,384,993 tons; and cleared for ports beyond the canal, 808, of 2,010,787 tons. In the coasting-trade 99,033 vessels, of 10,404,105 tons, were entered and 91,004, of 10,421,286 tons, cleared with cargoes. There were 86 vessels, of 4,540 tons, built in India in 1901, and the number first registered was 122, of 12,207 tons. Of the vessels built at Indian ports 46 were built in Bombay, 16 in Sind, and 16 in Madras.

Railroads, Posts, and Telegraphs.—The total length of railroads in operation in the beginning of 1901 was 24,707 miles, of which 5,859 miles were owned and operated by the Government, 12,335 miles were state lines operated by companies, 1,305 miles were guaranteed lines, 2,267 miles were assisted lines, 1,602 miles were lines owned by native states worked by companies, 208 miles were lines belonging to native states worked by the Indian Government, 1,157 miles were lines owned and operated by native states, and 74 miles were foreign lines. The capital of the Government railroads operated by the state was 891,151,975 rupees; of Government railroads leased to companies, 1,395,506,127 rupees; of guaranteed lines, 670,958,145 rupees; of assisted lines, 167,335,501 rupees; of lines belonging to native states, 160,904,092 rupees; of foreign lines, 17,627,520 rupees; total, 3,303,483,360 rupees for existing lines, besides which 8,913,365 rupees were subscribed for new lines and 15,114,112 rupees represent the coal-mines and unclassified expenditure, including surveys, making a total capital expenditure of 3,327,510,837 rupees. The receipts of all the railroads in 1900 amounted to 315,967,327 rupees; operating expenses, 150,995,875 rupees, being 47.79 per cent. of the gross earnings; net earnings, 154,124,192 rupees, being 4.99 per cent. on the capital; number of passengers carried, 174,824,483, paying 102,644,273 rupees; tons of freight, 43,615,289, paying 204,094,792 rupees. The guaranteed lines have been taken over by the Government, except the Madras Railroad, which cost £11,607,973, and the Bombay, Baroda, and Central Indian Railroad, which cost £10,397,910, and in 1906 and 1908 these will be transferred. In 1870 the Government gave up its claims for the repayment of interest advanced under the guarantees and the companies their right to more than half the surplus profits. British investors have over £200,000,000 in Indian railroads. There were no profits for the Government until it took the guaranteed lines. In 1900 the railroads of India for the first time brought a profit to the state, a small surplus of £58,000, which grew to £767,000 in 1901. There were 567 miles built in 1901, making the total mileage 25,373 miles, five times as great as it was in 1871. The average net profits on all Indian railroads was 5.26 per cent. in 1901. Many of the lines were built for famine protection and for strategic purposes, and some of these yielded a profit, while some purely commercial lines earned as much as 9.50 per cent. The Bengal and Assam Railroad,

constructed principally to benefit the tea districts in which much English capital is invested, was extended with difficulty over the hills into the Brahmaputra valley as a strategic railroad for the defense of the northeastern frontier, and the original estimate of £4,180,000 and the time of construction were doubled. The military lines from Jamrud to Peshawar and from Dargai to Nowshera were completed in 1901. The latter line has developed considerable trade between the frontier province and the recently hostile countries from which the occupying Indian garrisons were withdrawn, though trade with Kabul continues to decline, owing to restrictions imposed by the late Ameer. The line from Mandalay northward, which was originally intended to penetrate the Chinese province of Yunnan, will stop at Lashio, 50 miles short of the Salween river, but is expected to be of advantage in developing the northern Shan states. A line from Pegu to Moulmein has been surveyed and a line from Quetta to Nushki will be built, with a prospect of continuing it into the Persian province of Seistan. The Bengal and Nagpur Railroad taps the Jheriah coal-fields and affords a new outlet to Calcutta and Bombay. While English coal was abnormally dear the railroads had a large traffic in Indian coal. The general traffic has grown steadily since 1893. In 1901 there were 195,000,000 passengers carried, 10 per cent. more than in 1900. The increase was in third-class passengers, who pay average fares of less than a farthing a mile. The removal of plague restrictions and the disappearance of famine enabled many more natives to travel. The working expenses in 1901 were 48.81 per cent. of the gross earnings, having been diminished from 48.74 per cent. in 1897.

The post-office in 1900 forwarded 521,664,746 letters, newspapers, and other mail-matter; receipts, 19,624,722 rupees; expenses, 17,733,705 rupees.

The Government telegraph-lines on April 1, 1900, had a total length of 52,909 miles, with 170,766 miles of wire. The number of messages in the financial year was 6,237,301; receipts, 12,489,684 rupees; expenses, 10,890,819 rupees.

Financial and Economical Conditions.—Indians assert that there are two Indias—English India and the India of the natives. The native and unofficial members of the Viceroy's Council, whether they think that famine is due to the assessment of land revenue or to other causes, plead for a reduction of taxes, especially since the rupee has been made dearer by the currency laws, and consider that the cost of the army and defenses, which are to a great extent intended for the protection of the British Empire against enemies of Great Britain, ought to be shared by Great Britain or the army reduced, especially the British troops in India. The Government denied that the people of India were overtaxed, arguing that when revenues were elastic the taxes could not be excessive. That the people were exceedingly poor was admitted, and that the cultivators were running deeper in debt. Lord Curzon places the average annual income at 20 rupees a head. The average expenses of a farmer's family are 95 rupees a year. It is estimated that 40,000,000 of the people of India live their whole lives in a half-starved condition and 50,000,000 more subsist solely on the coarsest cereals and vegetables. The estimated total indebtedness of the farming population is £230,000,000, averaging £1 6s. a head. The famine commissioners found that in Bombay one-fourth of the cultivators had lost possession of their land and were mere serfs of the money-lenders, and that not one in five was free from

debt. The same conditions prevail throughout India. The investigations into land revenue showed that where assessments were lowest the people were most in debt, and from that the conclusion was drawn that the land tax was nowhere excessive. The system of exacting prompt payment in years of drought the same as in years of plenty was condemned, although it has been the British policy in India from the beginning, and the Government decided not only to remit arrears of land revenue altogether or postpone collection in the districts lately affected by famine, but for the future to introduce elasticity into the system of collection where it is required, as was the practise of the rulers who preceded the British in India and is generally customary with Oriental rulers. The Government has also undertaken to combat the evil of usury, which is transferring the land from the possession of the occupiers to that of a small class of money-lenders. In the Punjab and Bombay laws have been enacted giving courts power to review contracts of debt, and similar legislation is proposed for other parts of India. Agricultural banks are to be introduced experimentally. More restrictions are to be placed on the alienation of property. The Government continues to advance loans to the cultivators in the distressed districts. The drought of 1899 was considered by the Famine Commission, of which Sir Anthony McDonnell was president, to have been the severest that India had experienced. The crop losses in that season were over £50,000,000 in British India and £20,000,000 in the native states. The direct expenditure of the Government on relief up to March 31, 1901, was £6,300,000; agricultural advances and loans, £1,200,000; loss of revenue and indirect expenditure, £2,700,000, deducting £700,000 of additional receipts from railroads and canals. The excess of deaths due to famine was estimated for British India at 1,250,000. In the native states affected by famine population declined from 42,000,000 in 1891 to 36,000,000 in 1901, while in states not visited by famine, population increased over 12 per cent. The Indian Government loaned £2,333,000 to native states and guaranteed loans amounting to £700,000 to aid them in their operations of famine relief. Owing to the system of productive railroads the famines of 1897 and 1899 did not entail want of food in any district, as was the case in the Madras famine of 1877, the famine in Orissa in 1866, and all previous ones, but in the last two famines there was want of money to buy the surplus crops of the granary districts that the railroads brought into the stricken region. Careful and intelligent cultivation and incessant hard labor of men, women, and children do not prevent the peasantry from growing poorer and falling hopelessly in debt to the middle and higher classes, which are becoming richer. The argument in favor of a permanent settlement of the land throughout India, such as was made with the zemindars of Bengal, the Government meets by saying that the unearned increment, which the Government appropriates to itself by periodically raising the land taxes, would not be retained by the cultivators, but any extension of permanent settlements would multiply landlords to the detriment of the cultivators. Where the zemindari system has been established the Government generally limits its demands to half the net assets of the landlords, and has progressively reduced them in the Northwest Provinces, the Punjab, the Central Provinces, and Orissa, while laws have been enacted to protect rent-paying tenants against the landlords; where ryotwari, or peasant proprietary tenure under temporary settlements,

exists an assessment all round of one-fifth of the gross produce would be severer than the present assessments, which are half the net produce in Madras and Burma, not more than a tenth of the gross produce in the Central Provinces, less than a twelfth in the Punjab and the Deccan, and in Bombay, Assam, and all parts of India tend to diminish. The policy of settlements for longer terms is being extended. Where land is fully cultivated, rents are fair, and production is stable a readjustment is made only once in a generation; where rents are low, where there is much waste land and a fluctuating cultivation, or where the construction of roads, railroads, or canals, an increasing population, or rising prices cause resources to develop shorter settlements are necessary, but in order to leave more money to the landholder the Government has made the concession of taking the actual yield at the time of assessment, not the prospective yield, as the basis. Until the next revision the landowner enjoys all benefits arising from his improvements or the unearned increment accruing from outside circumstances. In Bombay and Madras special rules exempt improvements made by the enterprise of the cultivators from all future assessments, and rules are to be framed for zemindari provinces which will afford sufficient exemption of private outlay to stimulate the investment of capital in improvements. While some contend that only irrigation works or a rise in the price of produce can give a just right to increase assessments in ryotwari tracts, the Government claims the ancient right to share in the produce, and wherever there is an increase in the produce or in its value the state requires its share, though the right has been waived in some provinces and limited in others as regards increments due to the expenditure of labor or capital on the land. The Famine Commission found the incidence of land revenue moderate in good years except in Bombay. Among secondary causes of famine are enumerated subdivision of holdings, rack-renting by landlords and middlemen, the decline of indigenous industries, the usury of money-lenders, expenditure on litigation, extravagance in festivals, and payments of petty bribes. The famine fund, although diverted in war scares, has been repaid in famine relief amounting to £12,750,000, protective works costing £9,000,000, and reduction of debt to the amount of £1,500,000, so that at the end of twenty-five years only £1,750,000 of the £1,000,000 a year is owing. The excess of exports with which India pays the home charges of £16,000,000 a year is considered by many Indians to be the cause of gradual impoverishment and periodical famines. About £6,000,000 of these home charges are interest on capital, invested mainly in railroads and irrigation works, which pay the interest and earn a net profit besides; £6,000,000 are remitted to pay for civil and military services, which are officially regarded as more than equivalent to their cost, as the English *raj* has saved India from the internal strife by which she was formerly devastated and protected her from foreign invaders, and it secures justice and promotes the welfare of the people in various ways; £1,000,000 are remitted in payment for stores; and £3,000,000 represent interest on the ordinary debt, which is less than it has been. The more extensive employment of natives in higher posts would lessen the drain for leave pay and pensions, but it rests with the supreme Government to judge how far such posts can be safely and efficiently filled by natives. The practise of charging India with the cost of maintaining troops sent out of India to fight the battles of

the British Empire in other countries has always seemed to Indians a rank injustice and in some cases these charges have been contested by the Indian Government. After an investigation by a royal commission on Indian expenditure and a long discussion between the Indian Government and the British treasury officials, an arrangement was come to recognizing that India has sole interest in punitive expeditions on her borders, a direct and substantial interest in questions affecting Afghanistan and adjacent parts of central Asia, in questions affecting Siam, in questions affecting Persia and the coasts and islands of Arabia and the Persian Gulf, and in the security of the Suez Canal and the maintenance of established government in Egypt as affecting that security, and the interest in keeping open the Suez Canal might extend to the coasts of the Red Sea, but not to the Soudan or the upper Nile. In East Africa there may be a modified interest, and there is in questions affecting China and the Malay peninsula. In Japan or islands east and south of China, in the African coast south of Zanzibar or any part of Africa west of the Cape of Good Hope, or in Europe as a rule India has no direct or substantial interest in the employment of forces, and if cases arise in which the two governments do not agree no contribution shall be made by India until the sanction of Parliament is obtained. When disputes arise as to the interpretation of the agreement, or minor points of difference, the Lord Chief Justice, Lord Alverstone, will for the next three years be the arbitrator. By recommendation of the commission an annual charge of £260,000 has been transferred from the Indian to the imperial treasury.

The Indian revenue prospered even in the famine year ending March 31, 1901, when instead of the expected deficit of £826,000, there was a surplus of £1,670,000, not counting £3,100,000 of profits from the enormous coinage of rupees. The budget for 1902 figured out a surplus of £690,000, but owing to the withdrawal of troops for South Africa and China the actual surplus reached £4,900,000. The money saved was spent in rearming the Indian army. For 1903 it was decided to remit taxes and make grants for the relief of provinces that had suffered from drought and for the promotion of industries to the total extent of £1,500,000, leaving still an estimated surplus of £837,000, which was increased in the revised estimate to £1,700,000. Notwithstanding the disbursements to meet famine distress, the accounts for the three years show a surplus of £8,300,000, and during the same period the Government has spent £20,000,000 on railroads and £2,000,000 on irrigation. Moreover, a special gold fund was established, including the investment of £3,600,000 in British consols, for the purpose of giving stability to exchange. The Government looks for an increase of income under the main heads of revenue except opium, but makes no remission of taxes for 1903 except arrears of the land tax where there were no crops on account of the drought. The customs revenue promises to increase with the steady growth of external trade, which advanced from £130,000,000 in 1891 to £163,000,000 in 1901. The customs duties are levied mainly on articles consumed by the poorer classes, whose friends ask not merely for a reduction of the salt duty, but remissions on other necessities, and especially the abolition of the excise duty on domestic cotton cloth, imposed for the benefit of the Lancashire manufacturers. The railroads, on which there was a loss in 1891 of £458,000 on 17,300 miles costing £151,000,000, returned a profit of £795,000 to the Government in 1901, when there were 25,300 miles

open and £235,000,000 invested. In the meantime the state has acquired the guaranteed railroads, worth £80,000,000, giving annuities running fifty years, and these annuities are paid out of ordinary revenue. The capital of the productive debt has been largely increased, but whereas the investments entailed a loss of £1,550,000 in 1891, they returned a profit of £800,000 in 1901, while in the same period the service of the non-productive debt diminished from £2,450,000 to £1,487,000, so that the annual debt charge has been reduced £3,323,000 in ten years. The revenue from opium fell in ten years from £8,000,000 to £4,000,000, and in 1902 to £2,600,000. The area of poppy culture has been increased, and the Indian Government is accused of trying by increasing production to make up for the lessened profit due to Chinese competition. After the Indian Government had in 1889 reduced the area under poppy cultivation on account of overproduction, the British Government in 1891 gave a qualified pledge to gradually reduce opium production, and in 1893 Parliament passed a resolution in that sense and authorized the appointment of a commission to study the question. The commission adopted the view of the Indian Government that the large revenue then obtained from opium could not be replaced and reported against a policy of prohibition or any action tending to the destruction, unasked by China, of the export trade in opium. The annual product of Bengal opium, owing to bad years and consequent reduction of area, averaged only 40,500 chests between 1890 and 1893, but in 1899, a good year with increased area, gave 51,700 chests, and in 1900 the manufactured product was 52,400 chests, equal to the average for the ten years preceding the report of the Opium Commission in 1893. The Government has reduced the export to China, and this with increased demand elsewhere has kept up the price, which averaged 1,361 rupees a chest in 1901, compared with the 1,037 rupees for 1891, when 57,000 chests were sold. The Government now restricts cultivation to an area sufficient to produce for export not more than an average of 48,000 chests a year. The salt revenue has been disappointing because improved facilities for transportation have not increased consumption. The deduction is that the tax keeps consumption down, and the Government contemplates making a large reduction in the tax if financial conditions continue to be favorable, not for the reasons advanced by the Indians, that it is an unjust tax on an article of prime necessity for the health and comfort of the people, but with the object of making the consumption of salt general, so that the tax may be reimposed when fiscal needs require it. The tax of 2 rupees per maund of 82 pounds imposed in 1882 was increased in 1888 to 2½ rupees, but the increase was described as temporary. The proceeds of the tax in ten years increased only from £5,500,000 to £5,800,000. The consumption per capita remained stationary, though it increased when the tax was lower. The civil and military estimates and general administration increased only £3,500,000, or from £32,000,000 to £35,500,000, in ten years, and when £3,300,000 saved in the debt charge is reckoned the increase to the taxpayer was only £200,000. Increased expenditure is contemplated in connection with education and police and allotments to provincial governments, and expenditure on the army, instead of being diminished, will be increased. The British garrison is to be augmented. The British soldiers will receive 2d. more a day. As to paying the extra 6d. to reenlisted men the Indian Government demurred, and

the question has been referred to arbitration. The army expenditure had already increased from an average of £130,000,000 before 1892 to an average of £153,000,000 a year. The expense of entertaining Indian potentates who visited England as public guests in the times of the East India Company and later was always defrayed out of the Indian revenue. This was changed when the Indian princes went to attend the coronation in 1902, but the English Government restricted the expenditure to £100,000. Deeming this entirely inadequate, the Indian Government offered to pay the excess. The British treasury later assumed the entire cost, but there was a dispute and much public criticism regarding the size of the bill, although this was the first coronation at which the sovereign of the British Islands was recognized as Lord Paramount of India, and eventually the cost was shared by both governments. For the coronation durbār to be held at Delhi on Jan. 1, 1903, the Indian Government appropriated £250,000.

The total revenue for 1902 amounted to £44,000,000 and expenditure to £39,000,000. For 1903 revenue was estimated at £42,500,000 and expenditure at £41,500,000. The sum allowed for remission of arrears to tenants was £1,250,000. There was an increase in the land revenue of £299,000 in the revised estimate for 1902 over receipts in 1901. Customs revenue showed an increase of £644,000; stamps, £147,000; the mint, £515,000; railroads, £1,750,000. In the estimates for 1903 the land revenue, counting remission of arrears, was reckoned at £680,000 less than in 1902; the mint receipts, at £482,000 less, as no rupees were to be coined; customs revenue, at £232,000 less, as a continuance of abnormal importation was not expected; railroad receipts, at £229,000 less, the extraordinary traffic being expected to subside. With the return of the troops the army expenses were increased £1,535,000, and there were increases for civil departments, including education and police, and for irrigation, so that with a decrease in provincial balances of £2,585,000, instead of an increase of £1,400,000 in the previous budget, the estimated surplus, which was £4,673,000 in 1902, fell to £838,000. The opium revenue showed an increase of £311,000 in 1902, and fell off again £680,000 in the estimate for 1903, owing to lower prices; the excise revenue, after increasing £119,000 in 1902, was taken at the same figure for 1903. The Indian Government is criticized for licensing the retail traffic in opium and Indian hemp and for introducing liquor of a quality so bad that it is not allowed to be sold to soldiers, which is made in Government distilleries and purveyed in licensed shops. The Government promised to investigate the conditions of the traffic in Assam after the tea-planters had complained of the demoralizing influence of the liquor shops. The labor question is always a pressing one in Assam. Only 3 per cent. of the people living there are laborers, and consequently the British planters have to depend on coolies brought from other provinces. The Government licenses labor contractors and places those who are unlicensed under severe restrictions. Native Indians accuse the planters of abusing their laborers in spite of the Assam labor act of 1882, for their protection, which fixed a minimum rate of wages. The labor supply actually diminished after the protective act went into operation, and this, combined with overproduction and the English duty on tea, brought on a crisis in the industry. There were over 1,000 tea-gardens, with 660,000 laborers, in 1900. The immigration in that year

was 62,733, about the average number, but in 1901 it fell to less than half that number and recruits grew continually scarcer. The Chief Commissioner of Assam, Sir Henry Cotton, in 1900 reported that the laborers were underpaid and badly treated; yet remunerative and inviting employment could alone attract Indians far from their homes into a region so unhealthy. The statutory rate was 5 rupees a month for men and 4 rupees for women for three years of the contract and 1 rupee more for the fourth year, working nine hours a day, with Sunday a holiday. A new act was passed in March, 1901, which was intended to lessen the expenses of recruiting labor for the planters and secure from them better wages for the laborers, viz., 6 rupees for men and 5 rupees for women for the whole contract period of four years. Their influence with the Government was stronger than that of the Chief Commissioner, and on the plea of depressed conditions of trade they secured a continuance for two years of the old rates and after that a scale of wages beginning at the same rates as before and rising by yearly increments to the proposed higher rates, which are given only in the last year, as before. The contract laborer has free housing and medical attendance, and must be supplied with rice at a certain price, while the employer can arrest him without warrant if he absconds and can have him punished as a criminal if he will not work. In the best gardens the laborers, after they are broken in and acclimatized, are allowed to cultivate a piece of ground and keep live stock, and thus contentedly settle down and gradually become merged with the peasantry of the country, although this prevents the laborer from working full time after he has become efficient, and consequently from earning full wages. In some districts the planters, in order to avoid the inconvenience and expense of Government inspection, have generally given up the advantages of the act and hire free labor at higher rates. It is so in the more accessible regions, but there is no supply of migratory or indigenous labor for the Brahmaputra valley, and there the penal act is in practical operation with all its abuses. The mortality among the laborers was 85 per 1,000, but during the chief commissionership of Sir Henry Cotton it was reduced to 48. In practice the laborers are often, by fines and other subterfuges, cheated out of their wages, illegally and cruelly punished, deprived of their rice at the statutory price, and turned out when sick. Sir Henry Cotton and native writers believe that the statutory wages are insufficient to obtain wholesome food, and that under the penal system as applied the laborers are oppressed in various ways, and therefore they would prefer to have the act abolished. The planters pay the cost of the journey to Assam, equal to six months' wages, and they pay much more for recruiting the laborers, who are often, with the bought aid of relatives or local officials, forcibly abducted. Hence the planters are charged with preferring to pay a high price for kidnaping men and women whom they can practically treat as slaves under the penal clauses of the act, by the favor of accommodating inspectors, to giving market rates for free labor hired in the open market. The emigrant laborer suffers sickness and fever for the first two years, but if he survives that period he becomes attached to Assam and seldom returns to his old home when the contract expires. The new law did not make contract labor in the tea-gardens more attractive to immigrants, as was proved by the rise of the prices for recruitment and finally the total cessation of immigration.

While the military policy of the Indian Government has undergone no change and military charges continue to increase, while no attempts are made to reform the fiscal system or to introduce representative government, Lord Curzon, who has succeeded better than any of his predecessors in winning the confidence of both Anglo-Indians and natives, has adopted a safer frontier policy and has instituted inquiries having for their object reforms in the administration and important projects for the economic progress of the people. Commissions have investigated famine relief and prevention, the breeding of horses for farm and draft purposes, railroad building and management, irrigation, improvements in the general system of education and the universities, and the starting of industrial schools and technical colleges, the police, military decentralization, and the scheme of agricultural banks.

Frontier Disturbances.—In the new Northwest Frontier Province the policy of blockade has been adopted against border tribes that give trouble instead of that of punitive expeditions. Tribal allowances are paid for keeping open the passes, maintaining order, and punishing crime. The tribes are independent, and any form of government or whatever ruler any particular tribe chooses to have the Government of India is willing to acknowledge and deal with. Tribal levies receive pay and arms as militia employed to defend the Indian frontier against external attack. Whenever any tribe commits depredations or breaks the peace its allowances are withdrawn and all trade and intercourse with it are cut off until it makes peace. A blockade against the Mahsud Waziris, who failed to pay fines due for various offenses and were held collectively liable, the plan of making the head men responsible for order having been abandoned, was conducted by Col. C. C. Egerton from Dec. 1, 1900, till Nov. 1, 1901, without producing the desired results. A series of raids, with 1,000 to 2,000 men, who seized sheep and cattle and destroyed crops and villages, in four months brought the tribe to terms of peace, with a prospect that they would remain peaceful in order to earn the allowances that the Government promised them. The casualties of the blockade were 31 killed and 113 wounded. The garrisons holding Kuram pass and the Samana range on the frontier of Kohat were withdrawn in April and their places taken by subsidized tribal militia, the frontier railroad having been completed through Kohat. The regulars were concentrated at Nowshera, Kohat, Bannu, Dera Ismail, and other posts connected with the base by railroad. The Kabul Khel Waziris of Yagistan, whose country is on the Afghan border between the Tochi and Kuram valleys and between the British posts of Bannu and Thal, carried on predatory raids and blood feuds until it became necessary to chastise them. The guilty persons, when a demand was made for their punishment or surrender, invariably escaped over the frontier into Khost, and however willing the Afghan officials at Kabul might be to give them up, it was useless to demand of the Ameer's Pathan soldiers on the spot that they should betray their kinsmen. The officer who had conducted the campaign against the Mahsuds, now Major-Gen. Egerton, on Nov. 17 led out a force of 3,500 men with mountain guns, divided into four columns. Col. Tonnochy's column met a stubborn and unexpected resistance in storming one of the strong towers of the Waziris at Gumati, and the commander was fatally wounded, another officer killed, and three others were wounded. Reinforcements were sent and several villages notori-

ous for harboring outlaws were destroyed. The boundaries between India and Afghanistan in this region have been demarcated. All the territory formally annexed to India in 1902 was an area of 350 miles on the border of Tibet.

INDIANA. (See under UNITED STATES.)

INTERNATIONAL CONFERENCE OF AMERICAN STATES. The first International American Congress was held in Washington in 1889 and 1890, for the purpose of "discussing and recommending for adoption to their respective governments some plan of arbitration for the settlement of disagreements and disputes that may hereafter arise between them and for considering questions relating to the improvement of business intercourse and means of direct communication between said countries, and to encourage such reciprocal commercial relations as will be beneficial to all and secure more extensive markets for the products of each of said countries." The outcome of this conference, though judged a failure by many, was the creation of an association under the title of The International Union of American Republics, to be represented by an Executive Committee at Washington under the supervision of the Secretary of State of the United States, forming a bureau to be known as the Commercial Bureau of the American Republics. This International Union was to continue in force for ten years from the date of its organization. As the international conference made no express provision for the meeting of subsequent conferences, the provision that the International Union, through the bureau, should be conducted for the period of ten years under the plan then adopted, was regarded as an implication that at about the expiration of that period another conference would be held. Consequently the first official action looking to the assembling of a second conference was taken by the late President McKinley, who, in his annual message to Congress of Dec. 5, 1899, after referring to the interest taken by all the states forming the International Union in the work of its organic bureau, and the assurance that the bureau would continue for another ten years, suggested that it seemed expedient that the various American republics be invited at an early date to hold another conference, and that it should be held in the capital of one of the countries other than the United States.

In pursuance of these suggestions, the Secretary of State addressed a circular note to the diplomatic representatives of all the American republics accredited in Washington, proposing that the second conference be called to meet as soon as possible. In conversation with the Mexican ambassador, he informed him that it would give the United States Government much pleasure if the City of Mexico should be selected as the place of meeting, and the Mexican Government shortly afterward, through its Minister of Foreign Relations, announced that it would greatly appreciate the honor that would be conferred upon it by the selection of its capital as the place for holding the conference. This led to the selection of that city as the place of meeting, and on Aug. 15, 1900, the Mexican Minister of Foreign Relations addressed a note to the government of each of the American republics, inviting them to send delegates to the proposed conference, the date being fixed for Oct. 22, 1902. This invitation was at once accepted by all the countries with the exception of Chile, the Government of which replied that she could not do less than accept the ideas of the proposed conference as expressed by President McKinley, but, referring to the former conference, said that, regardless of the program naming the subjects proposed for dis-

cussion, a project on arbitration had been presented which was in direct contradiction with it, and was distasteful to her, for which reason the Chilean delegation had to abstain absolutely from taking part in the deliberations at that time. Consequently, before accepting the invitation, Chile insisted upon a clearly defined program, which could not lend itself to the stirring up of offensive questions, nor take up pending or past questions in which any of the states were interested. A tentative program being formed by the Executive Committee of the International Union and submitted to the countries, Chile replied that she would assist with pleasure, provided that, in conformity with this program, the proposed conference would not take upon itself the adoption of resolutions of a retroactive character relating to actual or past questions concerning any of the republics invited. This reply was considered at an executive meeting, and resolutions were adopted informing Chile that the tentative program in reference to arbitration "meant prospective, and in no wise retrospective, for the differences that may arise among the American republics at a date posterior to the date of the exchange of the treaty of arbitration that the conference may adopt." This reply was satisfactory to Chile, and she at once accepted, congratulating the committee on the elimination from the tentative program of all vexatious questions.

Mexico was lavish in her preparations for the entertainment of her guests. One end of the old palace of the viceroys, which flanks one side of the Zocolo, or great plaza, was fitted up for the assembly rooms of the conference in a most elaborate and artistic style, with a buffet, where lunches, wines, and liquors, and even cigars, were served without charge, and tips to waiters were prohibited. The arrival of the delegates at the capital was followed by an almost continual round of invitations to theaters, banquets, operas, and excursions. The conference was called to order by Señor Mariscal, Mexico's Minister of Foreign Relations, who delivered an address in which he referred to the results of the first congress and predicted success for the second. He spoke of Mexico's confidence in the friendly character of the gathering, and welcomed the delegates in the name of his Government and the people of Mexico. His speech was replied to by Señor Alzamora, chairman of the Peruvian delegation, reechoing his sentiments, refuting energetically any discord, and thanking the Government and people of Mexico for their hospitable welcome. The conference then elected a temporary chairman, and proceeded to its permanent organization by the election of Señor Mariscal and Hon. John Hay as honorary presidents; Señor Genaro Raigosa, of Mexico, president; Señor José Higinio Duarte Pereira, of Brazil, first vice-president; and Señor Baltasar Estupinian, of Salvador, second vice-president.

In anticipation of the opening of the conference, the Mexican delegation had prepared a project of rules and regulations governing the sessions, which provided for the appointment of 19 committees to take up the work and report upon the various projects before the conference. As no provisions had been made for the admission of press representatives to the sessions, this matter was taken up after the appointment of the various committees, and it appeared to be productive of the first friction among the delegations. Mexico explained that the omission of provision for press representatives was owing to scarcity of room, while Delegate Alzamora, of Peru, in a speech favoring the admission of the press, in

addition to giving out fairly full reports by the secretary of the conference after each session, said in part: "The public does not want merely a precise and cold relation of the propositions of the conference, but they wish to feel its pulsations moment by moment, which will give them some idea of its moral features. The subjects before the assembly are of public interest; they affect popular governments, and they should be made known through the press, which is the authorized organ of public opinion. Consequently the Peruvian delegation desires to have the press representatives admitted to the sessions, although the number may be limited."

Chile appeared to oppose the admission of the press, but later declared that she merely stood by Mexico in basing her objections on the scarcity of room, and she even went so far as to insinuate that Peru, in favoring the admission of the press, did so with the object in view of appearing as the champion of the press representatives. Señor Baez, of Paraguay, championed the cause of the press even more than Alzamora, saying that the press is an institution that forms a part of the political organism; in the same manner as the jury and other free institutions which have been adopted by the American republics, and he hoped that the admission of the press representatives would be a stimulus to the delegates, who more than once would receive useful advice from that very press. Señor Matte, of Chile, then moved that the press representatives be admitted in such number and in accordance with such regulations as the president should determine, which was precisely what Señor Alzamora had expressed; whereupon Señor Alzamora rose and in a dramatic manner declared that "principles were everything, and persons nothing," that once they had arrived at a certain conclusion, it made no difference whether it came from one delegation or another. His original motion was lost, while the motion of the Chilean delegate was carried, the United States, Mexico, and Hayti being the only votes cast in the negative. The delegations of the Argentine Republic, Venezuela, Ecuador, and Paraguay explained that they gave their votes in the affirmative because they considered the Peruvian and Chilean propositions equal.

After the election of officers, appointment of the committees, and adoption of rules and regulations, with a few minor recommendations, the conference adjourned for two weeks to allow the delegates and certain press representatives who had been admitted to the sessions to accept the invitations extended to them by the states of Puebla and Vera Cruz, to visit them for the purpose of forming an idea of their advance in industrial pursuits, arts, and sciences during Mexico's recent years of peace. A special train was provided for the excursionists, and they were winned and dined by the people of Puebla for several days, and inspected cotton-mills, breweries, tobacco factories, and a penitentiary which would be a credit to any country. From Puebla they were taken across the high table-lands to the point where the railroad winds down the mountainside back and forth, furnishing one of the most magnificent views of scenery perhaps in the world, into the state of Vera Cruz. At Orizaba, they were banqueted and inspected more cotton-mills, one at Rio Blanco representing an investment of \$18,000,000, and employing 3,200 persons in spinning, weaving, dyeing, and printing cotton, and turning it out in imitation of the finest French fabrics, even to the labels of the imported article. They were shown a jute-mill where the raw material from India is manufactured into sack-

cloth, rugs, carpets, etc., a brewery turning out a very fine product with the best machinery known, and a cigar factory where the guests were treated to boxes of cigars rivaling those produced in Cuba, and then they were taken farther down the coast to a great coffee plantation, at which a sumptuous banquet was prepared for them and there was music and good cheer.

When the conference reconvened in Mexico city, the president announced the receipt of a telegram from President Castro of Venezuela, replying to the offer of the conference to mediate in the conflict that appeared inevitable between that country and Colombia. This offer of mediation was one of the first acts of the conference, made on the motion of the delegation of the Argentine Republic, seconded by those of Bolivia, Brazil, Paraguay, Peru, and Uruguay. Chile looked upon this as a determined plan on the part of the above-named countries to establish a precedent by which an analogous mediation could be proposed in her questions on the Pacific with Peru and Bolivia, and consequently the motion was earnestly opposed by her delegates, who spoke one after the other against it, notwithstanding which it was adopted. Accordingly, a telegram was addressed to the presidents of each of the countries, tendering the good offices of the conference for the settlement of their difficulties. President Castro's telegram replied brusquely that his Government acted with a clear conscience in their affairs, understanding their own duties; and that the conference had no right to undertake to meddle in the differences between Venezuela and Colombia. Although this reply was received by President Raigosa during the adjournment of the conference, it was so carefully guarded by him that no word or hint of it was given out till the reassembling of the conference, when it was read in secret session, with the result that it fell upon the South American combination against Chile like a shower of cold water, while Chile regarded it as a triumph for her.

The strained feeling between the other South American countries and Chile culminated a little later, when, in a long essay by Cecilio Baez, of Paraguay, setting forth the opinions of his delegation in regard to obligatory arbitration, the most striking part of which was the lamenting of the terrible effects of war, and while admitting that there were wars called to diffuse civilization and to assure the reign of liberty and independence of a people, it was declared that there were others which nations carry on with the object of extending their frontiers or merely because they feel themselves strong and wish to put down their weaker neighbors. This declaration fell as a shot aimed directly at Chile; but when the secretary treated it as a digression from the order of the day by announcing that the discussion of the report of the Committee on International Bank and Monetary Exchanges was before the session, the Chilean delegate, Señor Matte, declared that he saw with pleasure that practical discussions were to begin, leaving aside platonic ones that were calculated to sow discord within the conference; that inasmuch as the delegation of Chile had come with the intention of giving preference to questions that were calculated to unite, and not divide the members of the assembly, it could only applaud the proposed resolutions offered by the Committee on Banking; and he urged that the congress should keep aloof from all digressions, limiting itself to the discussion of purely practical questions with effective results. To this Señor Bermejo, of the Argentine Republic, replied that, in his opinion,

arbitration was the main question to be treated by the conference; and that, in his opinion, it could not be said that any time had been wasted in listening to the Paraguayan's interesting speech. As it was evident that the South American opposition to Chile did not intend to let the matter be passed over, Señor Walker-Martínez, for Chile, made a few remarks which brought forth at once requests to be heard by delegates of Chile, the Argentine Republic, and Paraguay, whereupon the president announced that the hour fixed for adjournment had elapsed, and the session was adjourned. This day's proceedings promised to disturb the peace and harmony of the deliberations, if not to result in the withdrawal of certain of the delegates; but in the interval between the adjournment and the following session other delegates used their influence upon those who were desirous of continuing the discussion, and at the following meeting Señor Baez, on taking the floor, said he understood that both the chairman and the delegates desired the incident closed, and therefore he renounced his right to the floor, and regretted that any remarks by him should have given rise to any unpleasantness; and thus the incident was closed, the other members who had asked the floor withdrawing their requests.

A gloom was cast over the conference by the sudden death of the first vice-president, one of its most esteemed members, the Brazilian delegate, Señor José Higinio Duarte Pereira. The Hall of Sessions the morning after his death was draped in mourning, and resolutions were adopted adjourning the assembly till after the funeral. The body of the dead delegate was taken to the hall, where it lay in state a day and a night, covered with floral wreaths and decorations, tributes from the various delegations. Members of the press joined with the delegates in taking their turn guarding the body during the long hours of the night, and on the following day it was interred with becoming ceremony by the Mexican Government, President Díaz in person leading the funeral *cortège*.

It was the expectation of many of the delegates that the conference would finish its labors by the middle of December, thus enabling them to return to their homes for the Christmas holidays, but the middle of December found them with little actual work accomplished. There was a general feeling that the United States delegates should have taken more of an initiative in advancing the work. One of the Latin-American delegates even declared on the floor that it was useless to continue the discussion of the committee report on the project before the assembly unless the position of the United States was clearly defined upon the subject. This lack of initiative on the part of the United States delegates was the result of President Roosevelt's instructions, which instructions, contrary to the advice of Mr. W. C. Fox, acting director of the Bureau of American Republics, were not made public. The delegates themselves objected to the instructions being made public, and later brought their influence to bear upon Mr. Fox to have him reverse his opinion as to the advisability of their publication. President Roosevelt, in these instructions, after pointing out that the chief interest of the United States in relation to the other republics was the safety and permanence of the political system that underlies their and our existence as nations, and that it should be the effort of our commission to impress upon the representatives of our sister republics that above all we desire their material prosperity and their political security, said that "it is not,

therefore, opportune for the delegates of the United States to assume the part of leadership in the conference, either in its official organization or in its discussions, a position which naturally belongs to Mexico, the inviting nation and host of the occasion." It was desirable, he said, that the plans and propositions of the Latin-American states should be solicited, received with consideration, and, if possible, brought to fruition; and great care should be taken not to wound the sensibilities of any of the republics or take sides upon issues between them. He warned the delegation to proceed with great caution with respect to political differences subsisting between the states, the general principle being to enter as little as possible into these questions, at the same time it being useful to impress upon all the deep interest which the Government of the United States has in the peace and tranquillity of all the American states and their territorial integrity.

The sessions dragged on through the month of December, during which the nervous strain caused by the important question of arbitration was apparent. Several times it appeared to be the rock upon which the conference was to be wrecked. While Chile had insisted from the very inception of the congress that she did not purpose to assist at a conference where she would be open to attack by her enemies, for which reason she insisted upon the tentative program being defined as not bringing up vexatious questions, nor the arbitration of past differences, on the other hand her South American neighbors appeared determined to force upon her the disagreeable project of obligatory arbitration. Mexico, in trying to act as peacemaker, incurred the animosity of both parties, and it was said that while she promised Chile that she, to her, disagreeable subject should not be brought up in the conference, she agreed to sign the obligatory arbitration project in the committee report, in which case the Chilean delegates accused her of duplicity and double-dealing, which they would expose on the floor of the conference if she persisted in signing the project. Mexico, fairly driven into a corner, hesitated to act; and she was accused by the South American combination of having no blood, and, mid threats to withdraw from the conference, several of the delegations remained away from the sessions. Mr. Buchanan worked incessantly and propounded various measures to get the delegations together on the subject and prevent the conference from going to smash, when a note of alarm was sounded in open session, about the middle of January, by the presentation of a proposition, signed by nearly all the delegations, proposing a slight change in the rules and regulations, which Chile, not having been consulted in the matter, took as part of a determined plan to cut her out of the proceedings. This led to the Chilean delegate, Walker-Martinez, leaving the hall in a rage, the president having refused to adjourn the session upon his calling attention to the fact that the hour for adjournment had passed. But immediately afterward, on motion of Mr. Pardo, one of the Mexican delegates, recognizing the right of the Chilean delegate to ask for time to study the proposed change in the regulations, the meeting was adjourned. At the following session, Mr. Walker-Martinez explained his reasons for leaving the hall, expressing, by a few words, in the time necessary for him to walk across the floor, his severe opinion of the conduct of the chairman. His few words, he said, were changed in the columns of a certain newspaper into a series of observations and strictures regarding Mexico, which nation he could not possibly

involve in reproach, whatever might be his opinion regarding the conduct of the president of the conference. Finding himself in discord with Mr. Raigosa, he should have acted as he would have acted in the parliament of his own country; but as he was a foreigner and, like every other delegate, was indebted to Mexico for its hospitality, he could not ask a vote of censure, for which reason he was compelled to leave the hall quietly. There was a difference of opinion between the president and the speaker, but the time when the incident happened had passed, and he fully accepted the minutes of the previous meeting. Immediately upon the adoption of the minutes, the secretary read a note addressed to the president by the delegations of the Argentine Republic, Bolivia, Colombia, Costa Rica, the Dominican Republic, Salvador, the United States, Guatemala, Hayti, Honduras, Mexico, Nicaragua, Paraguay, Peru, and Uruguay, saying that they had signed a protocol in which they declare that the principles established in the convention of The Hague should be considered as American public law, and that the governments of the United States and Mexico had been entrusted with the mission to negotiate their adherence to said treaties accompanying the text of the resolutions approved, in order that they be sent through the secretary to the Mexican Minister of Foreign Relations, so that the resolutions be duly executed. This was in accordance with a well-defined plan agreed upon outside of the conference in order to avoid the discussion that had so long threatened the disruption of the conference. But Chile, determined to have her way, through her delegate, Mr. Blest Gana, requested that before giving the customary ruling, the president should order the reading of a project on the same subject presented by his delegation, since said project coincided in ideas and desires with the treaty that had been read. He concluded by saying it was with great pleasure that he saw that his ideas were shared by the majority of the delegations represented. Mr. Carbo, for Ecuador, said he was a partizan to the adherence to the treaty of The Hague, and that he had not signed the protocol presented because the instructions he had from his Government did not allow him to sign anything outside of the conference. The president replied to Mr. Blest Gana that the chairman was obliged to have the documents presented to the secretary in the order in which they were received, and that the Chilean project would be read in its turn. When the secretary announced this ruling, a stormy discussion ensued, and the president said that as the ruling of the chairman had been attacked, the assembly would be asked whether it would approve the ruling or not. But before this was put to a vote Mr. Walker-Martinez, for Chile, questioned the right of any of the delegations to sign the protocol of any treaty outside of the conference, and a long discussion on this point ensued. Gen. Reyes, of Colombia, said his delegation was one of the 15 signing the protocol, and when he attached his signature to it he believed that in that way all kinds of obstacles would be avoided; but as these obstacles unfortunately had increased he proposed that the proposition submitted by the Chilean delegation be read, together with that presented by the 15 delegations on the same matter, and a report be submitted thereon. It was finally proposed by the Chilean delegation, in order to overcome the difficulties and facilitate the termination of the matter, that the following proposition be accepted by the conference.

"The Chilean delegation takes as its own the

project of adherence to the convention of The Hague, signed by 15 delegations, and submits it to the consideration of the conference, in order that as soon as it may be approved it be transmitted by the secretary to the Department of Foreign Relations of Mexico."

Mr. Carbo, for Ecuador, entreated the conference to accept this proposition. The discussion being continued without any apparent hope of reaching an end, the president said that, in view of the constant censures made by Mr. Walker-Martinez on the rulings of the chairman, he was obliged to break the silence which his official capacity as president imposed upon him not only to determine the precise matter under debate, but also to appeal to the delegation of Chile, on whose answer would depend the ruling that the chairman would make and the course that would be given to the discussion. He said the only thing under debate was the previous ruling, and concluded by asking the delegation of Chile to be good enough to say if it withdrew its opposition to that ruling. As Chile refused to do this, the discussion of the ruling was continued. Two days were taken up in the stormy discussion without the question of the ruling being brought to a vote, when a happy solution at last was devised by Mr. Buchanan, of the United States, who said that the minutes of the conference for the two days past showed, in the remarks officially made by each of the Chilean delegates and by the delegate from Ecuador, their entire and hearty concurrence in the principles of The Hague convention, and their cordial and unqualified acceptance thereof. These facts were therefore on record, and to the end that these expressions of adherence on the part of the two delegations might have the proper, courteous, and consistent weight and voice given to the similar expressions made in the protocol on the part of the other delegations, he requested the president, in the name of those delegations, with the consent of those of Chile and Ecuador, to transmit with said protocol the minutes of the two past days referred to, in order that the protocol and said minutes should be communicated to the Mexican Minister of Foreign Relations, and that the documents be communicated to the respective governments as an expression of the general adherence to the conventions of The Hague. Chile and Ecuador announced their acceptance of this proposition because it fulfilled the desires expressed by them in the course of the debate. This part of the question on arbitration being closed, the secretary read a note addressed to the president by the delegations of the Argentine Republic, Bolivia, the Dominican Republic, Guatemala, Salvador, Mexico, Paraguay, Peru, Uruguay, and Venezuela, in which they announced that they had concluded a treaty of compulsory arbitration besides the one of adherence to the conventions of The Hague, and that they sent the said treaty to the conference in order that it should transmit it to the Department of Foreign Relations of Mexico to be perfected. The president ruled that this treaty be transmitted to the Department of Foreign Affairs for the purpose stated, and the all-important question of arbitration was closed, after which the work of the conference was speedily brought to an end. On the afternoon of Thursday, Jan. 30, all remaining business being disposed of, a vote of thanks was extended to the secretaries of the various delegations, as also to the press representatives; farewells were said, and complimentary remarks and a general feeling of good-fellowship prevailed. Closing remarks were read by the president, after which it was an-

nounced that there would be a closing session on the following afternoon to which the friends and families of the delegates and their secretaries were invited. These closing exercises took place after a sumptuous banquet given at Chapultepec by the Peruvian delegation. A farewell speech was read by Señor Mariscal, Mexico's Minister of Foreign Relations, after which the delegates, their secretaries, and the press representatives and their families were escorted to the other end of the palace, where they were congratulated on their good work by President Diaz, who took leave of them all, shaking hands with them as they passed out.

The work of the conference is represented by the following protocol, treaties, conventions, resolutions, and recommendations:

Protocol of adhesion by the American republics to the convention for the pacific settlement of international disputes signed at The Hague July 29, 1899; treaty of compulsory arbitration signed by 10 delegations; treaty for arbitration of pecuniary claims; resolution favoring construction of the Pan-American Railway; resolution providing for an international customs congress; resolutions for consideration by the customs congress of means to facilitate American international commerce; resolution on quarantine and international sanitation; resolution providing for reorganization of the International Bureau of the American Republics; resolution providing for collection and publication of more complete information regarding the sources of production and statistics of the American republics; resolution providing for an international American congress to consider the crisis in the coffee industry; recommendation for establishment of an international American archeological commission; resolution approving the construction of an interoceanic canal by the Government of the United States; recommendation for establishment of an international American bank; resolutions of greeting to the future Republic of Cuba; recommendation in favor of the Philadelphia Commercial Museum; resolution approving the Louisiana-Purchase Exposition; resolution congratulating the officials of the Pan-American Exposition and the citizens of Buffalo; resolution communicating to the American republics the invitation of the International Association of Olympic Games to participate in the games to take place in Chicago in 1904; resolution thanking Gen. Rafael Reyes, of Colombia, for his work in exploring the river systems of South America, and commending his work to the several governments; resolution congratulating Mr. Santos-Dumont, the Brazilian aeronaut; resolution expressing esteem for Mr. Carlos Calvo, the Argentine writer on international law; resolution thanking the officers of the conference; resolution thanking the President of Mexico and other officials for their hospitality to the conference; treaty for extradition of criminals and for protection against anarchy; convention for practise of the learned professions; convention for formation of codes of public and private international law; convention on literary and artistic copyrights; convention for exchange of documents and government publications; treaty on patents and trade-marks; convention on the rights of aliens; resolution providing for future international American conferences; and a convention signed by the delegations of the Argentine Republic, Bolivia, Colombia, Ecuador, Paraguay, and Uruguay for a geographical congress at Rio de Janeiro.

It is believed that the results of the conference will be of great and lasting benefit to the nations

participating in its deliberations. That the relations between the American republics have been improved as a result, can not be doubted, as is clearly demonstrated by the change of sentiment on the part of the Latin-American countries and their representatives since the convening of the first conference twelve years ago. The countries then looked upon the project of an international conference, coming from the United States, with distrust and suspicion, believing that it was a scheme of the United States to extend its expansion over those countries; but the delegates returned to their homes fully satisfied that the United States was inspired only by a desire for their safety and well-being. At the second conference, instead of the United States being looked upon with distrust, just the reverse happened, the tendency of all the countries being to regard our country as the big brother who should take the lead in their various projects and deliberations, and guide them with a benevolent and protecting hand. The intimate daily association for nearly four months of representative men from every American republic tended toward this result, and the careful way in which the United States delegates avoided meddling with, or giving any opinion upon the political differences between the other states, convinced them of our determined policy that they maintain their political autonomy, and our desire, above all, for their material prosperity. Some of the projects and resolutions are doomed to remain in the air, owing to a little want of foresight on the part of their projectors, who failed to put them in the hands of some permanent committee or board to attend to the details of carrying them out, as was done with the proposed coffee congress, the custom-house congress, and the congress of sanitation. It was recognized, however, that the action of the conference on many matters could not be final, and that it ought to be followed up by further action at a subsequent congress, and consequently it was decided that not more than five years should intervene between the adjournment of this and the meeting of a third, unless it should be found, at the expiration of five years, that a postponement is desirable. The resolution passed to this effect specified that the congress should meet at a place to be selected by the Secretary of State of the United States and the diplomatic representatives in Washington, who should prepare the program and arrange details for the meeting.

IOWA. (See under UNITED STATES.)

ITALY, a kingdom in southern Europe. The throne is hereditary in the line of Savoy by male descent in the order of primogeniture. The reigning King is Vittorio Emanuele III, born Nov. 11, 1869, only son of Umberto I and Queen Margherita, daughter of Prince Ferdinando of Savoy. He succeeded to the throne in consequence of the assassination of his father on July 29, 1900, married on Oct. 26, 1896, Princess Helena, daughter of the Prince of Montenegro. The legislative authority is vested in the Parliament, consisting of a Senate and a Chamber of Deputies. The Senate had 348 members in 1901, including 5 royal princes who are Senators by right of birth. Senators are appointed from among citizens who have held high office or attained distinction in science, art, literature, or have conferred benefit on the nation in other pursuits. The number of Senators who may be appointed is not limited by law. The Chamber of Deputies contains 508 members, 1 to 64,000 inhabitants, elected in separate districts by all male citizens twenty-one years of age who have an elementary education or pay

a certain amount of taxes or rent or occupy a shop or farm or have served two years in the army. Soldiers in active service are debarred from voting and salaried officials and ecclesiastics from sitting in the Chamber. The parliamentary period is five years. The Cabinet in the beginning of 1902, first constituted on Feb. 14, 1901, was composed as follows: President of the Council, Giuseppe Zanardelli; Minister of the Interior, Giovanni Giolitti; Minister of Foreign Affairs, Giulio Prinetti; Minister of the Treasury, Signor di Broglio; Minister of Finance, Paolo Carcano, appointed Aug. 9, 1901; Minister of Justice and Ecclesiastical Affairs, Francesco Cocco-Ortu; Minister of War, Gen. Count Coriolano Ponza di San Martino; Minister of Marine, Vice-Admiral Constantino Enrico Morin; Minister of Commerce, Industry, and Agriculture, Guido Baccelli, appointed Aug. 4, 1901; Minister of Education, Nunzio Nasi; Minister of Public Works *ad interim*, Signor Zanardelli; Minister of Posts and Telegraphs, Tancredi Galimberti. Count Giussio afterward was made Minister of Public Works.

Area and Population.—The area of Italy is 110,646 square miles. The population at the census of Feb. 9, 1901, was 32,449,754, showing an increase of 0.73 per cent. per annum since 1881, as compared with 0.619 per cent. in the previous ten years and 0.40 per cent. between 1861 and 1871. With the exception of 90,000 of Albanian, 90,200 of French, 31,200 of Greek, 30,000 of Slavic, 11,400 of German, and 9,800 of Spanish origin settled in various parts of the country all the inhabitants of Italy are of ancient Italian stock. The number of marriages in 1900 was 232,631; of births, 1,067,376; of deaths, 768,917; excess of births, 298,459. The number of emigrants in 1900 was 352,782, of whom 181,047 went to other countries in Europe, 87,714 to the United States, 42,720 to the Argentine Republic, Uruguay, and Paraguay, 27,438 to Brazil, 1,686 to Canada, 2,523 to Mexico, Colombia, Venezuela, and Central America, 409 to Chile, Peru, and Bolivia, 3,137 to America without designation of their destination, and 904 to other countries. Of the total number 199,573 declared their emigration to be temporary. This was the case of nearly all who left for other European countries, although many of these decide later to emigrate to America and embark in foreign ports. Of the total of emigrants 23,322, including 15,282, went from Piedmont; 3,804, including 328 temporary, from Liguria; 21,401, including 16,678 temporary, from Lombardy; 104,910, including 100,931 temporary, from Venetia; 22,594, including 19,429 temporary, from Emilia; 21,971, including 16,146 temporary, from Tuscany; 9,381, including 2,926 temporary, from the Marches; 2,415, including 1,900 temporary, from Umbria; 1,489, including 1,253 temporary, from Lazio; 22,932, including 4,296 temporary, from Abruzzi and Molise; 49,970, including 11,812 temporary, from Campania; 4,936, including 367 temporary, from Apulia; 10,797 from Basilicata; 23,328, including 6 temporary, from Calabria; 28,838, including 7,530 temporary, from Sicily; 694, including 689 temporary, from Sardinia. The population of the chief Italian towns on Feb. 9, 1901, was as follows: Naples, 563,731; Milan, 491,460; Rome, 463,000; Turin, 335,639; Palermo, 310,352; Genoa, 310,352; Florence, 204,950; Bologna, 152,009; Venice, 151,841; Messina, 149,823; Catania, 149,694.

Finances.—The budget estimate of revenue for the year ending June 30, 1902, was 1,811,924,509 lire. The ordinary receipts were estimated at 1,732,167,444 lire, and the extraordinary receipts at 79,757,065 lire. The ordinary expenditures

were estimated at 1,627,033,526 lire, and the extraordinary expenditures at 163,926,253 lire; total expenditures, 1,790,959,779 lire. The revenue from railroads was reckoned at 88,832,200 lire; from real property, 11,152,000 lire; from other state property, 1,586,000 lire; from the land tax, 100,840,000 lire; from income tax, 290,715,000 lire; from the tax on buildings, 89,400,000 lire; from succession duties, 37,500,000 lire; from registration, 59,000,000 lire; from stamps, 68,000,000 lire; from various taxes on transactions, 58,640,000 lire; from excise duties, 103,000,000 lire; from customs, 211,050,000 lire; from *octrois*, 52,325,000 lire; from the tobacco monopoly, 201,000,000 lire; from the salt monopoly, 75,500,000 lire; from lotteries, 67,500,000 lire; from quinin, 1,440,000 lire; from the post-office, 64,000,000 lire; from telegraphs, 15,500,000 lire; from other public services, 23,024,100 lire; repayments, 24,585,570 lire; various receipts, 24,627,000 lire; total effective receipts, 1,669,217,470 lire; *recettes d'ordre*, 62,949,974 lire; total ordinary revenue, 1,732,167,444 lire. The effective extraordinary receipts were 5,584,237 lire; receipts on account of railroad construction, 232,537 lire; movement of capital, 5,378,840 lire from sales of land, etc., 43,497,000 lire from new loans, etc., and 25,064,451 lire from compensation, etc.; total extraordinary revenue, 79,757,065 lire. The expenditure for the service of the consolidated debt was 478,226,196 lire; service of redeemable debt, 60,129,183 lire; service of floating debt, 121,756,522 lire; railroad annuities, 26,288,150 lire; fixed annuities, 5,759,000 lire; civil list and appanages, 16,050,000 lire; Senate and Chamber of Deputies, 2,177,000 lire; various expenditures of the Treasury, 14,845,360 lire; *dépenses d'ordre* of the Treasury, 8,076,363 lire; collection of taxes, 75,941,841 lire; monopolies, 89,524,220 lire; various expenditures of the Finance Ministry, 23,752,084 lire; *dépenses d'ordre* of the Finance Ministry, 30,231,864 lire; Ministry of Justice, 41,327,301 lire; Ministry of Foreign Affairs, 16,392,461 lire; Ministry of Public Instruction, 48,476,268 lire; Ministry of the Interior, 67,936,582 lire; Ministry of Public Works, 38,338,841 lire; Ministry of Posts and Telegraphs, 68,560,694 lire; Ministry of War, 264,877,132 lire; Ministry of Marine, 118,318,016 lire; Ministry of Agriculture, Industry, and Commerce, 10,047,548 lire; total ordinary expenditures, 1,627,033,526 lire. The extraordinary expenditure of the Ministry of the Treasury was 84,247,862 lire; of the Ministry of Finance, 9,007,891 lire; of the Ministry of Justice, 19,600 lire; of the Ministry of Foreign Affairs, 24,000 lire; of the Ministry of Public Instruction, 635,431 lire; of the Ministry of the Interior, 3,718,569 lire; of the Ministry of Public Works, 53,988,884 lire; of the Ministry of Posts and Telegraphs, 551,516 lire; of the Ministry of War, 4,076,000 lire; of the Ministry of Marine, 4,498,540 lire; of the Ministry of Agriculture, Industry, and Commerce, 3,157,960 lire; total extraordinary expenditures, 163,926,253 lire. In the category of effective revenue and expenditure receipts were calculated at a total of 1,674,801,707 lire and disbursements at 1,620,590,602 lire, showing a surplus of 53,211,105 lire; under the head of construction of railroads receipts were 232,537 and expenditures 17,533,927 lire, leaving a deficit of 17,533,927 lire, and under the head of movement of capital 88,652,739 lire of expenditures to 73,940,291 lire of receipts left a deficit of 14,712,448 lire. The ordinary revenue is 105,133,919 lire in excess of the ordinary expenditure as estimated in the budget, while the extraordinary revenue falls short of the extraordinary expenditure by 84,169,188 lire.

The capital of the consolidated and redeemable debt on July 1, 1900, amounted to 12,645,289,334 lire. The annual interest was 579,855,494 lire. The interest on all the debts, including the permanent annuity of 3,225,000 lire due to the Holy See and 11,850,000 lire on treasury bonds and other floating debt, amounted in 1901 to 588,634,644 lire and the sinking-fund of the redeemable debt amounted to 2,506,905 lire. The 5-per-cent. perpetual *rentes* amounted to 400,392,409 lire, 3-per-cent. *rentes* to 4,803,262 lire, 4½-per-cent. *rentes* to 60,384,131 lire, and the 4-per-cent. *rentes* to 7,741,256 lire, making the annual charge of the consolidated debt 473,321,058 lire. The debts separately inscribed called for 11,735,598 lire for interest at 3 to 5 per cent. and sinking-funds of 443,099 lire extinguishing them between 1907 and 1961. Other redeemable debts required 88,502,988 lire for interest at 3 to 6 per cent. and 2,063,806 lire for their sinking-funds, which will extinguish them between 1902 and 1986. For several years the Government has aimed to create such confidence in the stability of Italian finance that it will be able to convert 9,000,000,000 lire of consolidated debt into 3½-per-cent. stock at par. Baron Sonnino restored the financial equilibrium, and for eight years there has been a constant surplus, even with some remissions of taxation, bringing the credit of the Italian Government up to the level of that of the richest nations in Europe. Signor di Broglio, a Conservative, was taken into the Zanardelli-Giolitti Cabinet as Minister of the Treasury as a guarantee that a cautious financial policy would be still pursued. His resistance to the demands of his colleagues grew so weak, however, that a deficit was escaped by a narrow margin in 1902, when abnormal wheat importations and some more solid improvements brought an increase of 12,500,000 lire in the revenue, but disbursements were increased nearly 25,000,000 lire. For 1903 he committed himself to 12,500,000 lire of additional expenditure. The year ending June 30, 1901, showed a surplus of nearly 50,000,000 lire, and one of 25,000,000 lire was predicted for the next year, but half of this disappeared in supplementary estimates and the cost of militarizing railroad employees and mobilizing one class of the reserves to avert a railroad strike was 9,500,000 lire, reducing the surplus to 3,000,000 lire. In the summer the treasury issued 100,000,000 francs of 3½ per cent. to take up floating debt. It was sold at 96 to Italian banks and brokers and rose almost to par in Paris where Italian Government securities are marketable again after many years. The condition of the state banks in Italy has become satisfactory and the premium on gold almost disappeared in 1902. The general prosperity of the country has helped much to uplift the Government credit, in conjunction with rigid economy enforced by Ministers Sonnino, Luzzati, Boselli, and Rubini, and expanding production and good crops are not the only factors in this prosperity; other causes, which have helped to promote industrial expansion and agricultural betterment, are the enormous amount of money remitted or brought home by Italian emigrants and the increasing amount spent by tourists in Italy.

The Army.—All able-bodied Italians are bound to military service between the ages of twenty and thirty-nine. The annual levy is divided into 3 categories. Those who are drawn by lot in the first category, or who volunteer, serve two or three years with the colors and five to seven years on leave in the permanent army, then three or four years in the mobile militia, and seven years in the territorial militia; except cara-

bineers and non-commissioned officers, who serve five years with the colors and four years on leave in the permanent army and ten years in the territorial militia. Conscripts of the second category are enrolled in the permanent army for eight or nine years, in the mobile militia for three or four years, and in the territorial militia for seven years, but receive only from two to six months of training. Those of the third category have one month of instruction and are inscribed at once in the territorial militia, the final reserve which has garrison duty to perform in case of war. In 1899 the number of recruits examined was 364,747, of whom 102,422 were assigned to the first category, 16 to the second, 96,956 to the third, 87,166 were put back, and 78,187 were found unfit for service. In 1900, by a special act of Parliament, all young men called up for service who did not of right belong to the third category as the props of their families, were assigned to the first category. Non-commissioned officers who after completing their term of five years continue in the service for twelve years receive posts in Government employment. The army is organized in 12 corps: 1st, Turin; 2d, Alexandria; 3d, Milan; 4th, Genoa; 5th, Verona; 6th, Bologna; 7th, Ancona; 8th, Florence; 9th, Rome; 10th, Naples; 11th, Bari; 12th, Palermo. The Roman corps has 3 divisions, the others 2 divisions, each comprising from 2 to 7 of the 88 military districts. The officers are generally graduates of the military colleges. There are 13,572 active officers in the permanent army, 291 retired, 11,162 supplementary officers on leave, 843 auxiliary officers for the mobile militia, and 4,118 effective and 6,263 reserve officers for the territorial militia; total, 13,863 officers in the permanent army, 11,997 reserve officers, and 10,381 officers of the territorial militia. The rank and file of the permanent army in active service in 1900 numbered 249,821 of all arms, comprising 24,760 carabinieri, 124,794 infantry, 15,477 bersaglieri, 11,989 Alpine troops, 874 in military districts, 22,342 cavalry, 31,435 artillery, 8,812 engineers, 1,377 in military schools, 2,811 sanitary troops, 2,189 in the commissariat, 156 in the invalid and veteran corps, 2,423 in penal establishments and disciplinary companies, and 382 in remount depots. The troops of the permanent army on unlimited leave were 4,721 carabinieri, 269,487 infantry, 31,100 bersaglieri, 21,699 Alpine troops, 10,403 in military districts, 28,738 cavalry, 80,483 artillery, 21,211 engineers, 10,052 sanitary troops, 4,297 commissary troops, and 10,064 in the police, railroad, and telegraph services; total, 492,255. The mobile militia consisted of 366 carabinieri, 192,104 infantry, 21,082 bersaglieri, 14,299 Alpine troops, 3,656 unassigned, 46,891 artillery, 12,592 engineers, 7,758 sanitary troops, 2,901 commissary troops, and 6,117 in the police, railroad, and telegraph services. The total number of men enrolled in the ranks of the territorial army was 2,222,637, making the total war strength of the army 36,241 officers and 3,308,650 non-commissioned officers and men. In Africa a special corps is maintained consisting of 1,062 Europeans and 5,787 native troops, besides 755 irregulars. The infantry weapon of the Italian army is the Carcano-Mannlicher rifle of the model of 1891, having a caliber of 6.5 millimeters and a magazine holding 6 cartridges. The territorial militia is provided with Vetterli rifles.

The Navy.—The Italian fleet in 1901 consisted of 3 second-class and 4 third-class battleships, 8 armored cruisers, 5 old battle-ships, 12 protected cruisers, 15 torpedo-gunboats, 5 destroyers, 11 first-class, 100 second-class, and 71 third-

class torpedo-boats, and 1 submarine boat. The barquette ships *Lauria*, *Andrea Doria*, and *Francesco Morosini*, of 11,174 to 11,324 tons, built in 1884 and 1885, and at that time accounted the most formidable vessels afloat, each carrying 4 17-inch guns, are now antiquated. The refitted and rearmed *Dandolo*, of 12,265 tons, armed with 2 10.8-inch guns in turrets, with 6 6-inch guns and 5 4.7-inch quick-firers, is considered more effective, and they are surpassed by the *Ammiraglio di Saint Bon* and *Emanuele Filiberto*, of 9,800 tons, launched in 1897 and armed with 4 10-inch guns in barbettes and 8 6-inch and 8 4.7-inch quick-firers. The first-class battle-ships *Regina Margherita* and *Benedetto Brin*, launched in 1901, having a displacement of 13,500 tons and a speed of 21 knots, with engines of 18,000 horse-power, and 8-inch steel plates, will carry 4 12-inch guns in turrets and a quick-firing armament of 4 8-inch, 12 6-inch, and 8 3-inch guns. Two other turret-ships, the *Regina Elena* and *Vittorio Emanuele III*, will have a displacement of 12,625 tons, 10 inches of armor, engines of 20,000 horse-power to give a speed of 22 knots, and an armament of 2 12-inch guns and 12 8-inch and 12 3-inch quick-firers. The protected cruisers *Italia* and *Lepanto*, of 15,654 and 15,900 tons, launched in 1880 and 1883, are to be reconstructed, and their 100-ton guns are to be replaced with 10-inch or 12-inch breech-loaders, as has been done in the *Dandolo* and will be in other vessels armed with these monster cannons. The *Re Umberto*, *Sardegna*, and *Sicilia*, launched in 1888, 1890, and 1891, of 13,893, 14,860, and 13,298 tons, were the fastest and most powerfully armed cruisers of their time, carrying pairs of 67-ton guns in barbettes fore and aft and 8 6-inch and 16 4.7-inch quick-firers, but with an armor belt only 4 inches thick. The *Marco Polo*, of 4,583 tons, launched in 1892, and the *Vettor Pisani* and *Carlo Alberti*, of 6,500 tons, launched in 1895 and 1897, were likewise designed for quick maneuvering, speed, and weight of fire, the former carrying 6 6-inch and 10 4.7-inch, the two latter 12 6-inch and 6 4.7-inch quick-firers. In the new *Varese*, *Giuseppe Garibaldi*, and *Francesco Ferruccio*, of 7,400 tons, the armament consists of 1 10-inch turret-gun and 2 8-inch, 10 6-inch, and 6 4.7-inch quick-firers, while their speed is 20 knots, equal to that of the others. In the later Italian vessels due attention is paid to protection. The *Ammiraglio di Saint Bon* and *Emanuele Filiberto* have a complete 10-inch belt and 3-inch decks, and the later vessels have a complete belt at the water-line and their batteries protected down to the base. The armor is the Terni system and is strong enough at all points to keep out shell, though pervious to heavy shot. The *Vittorio Emanuele* and *Regina Elena* have 10 inches on the water-line and the turrets, 8 inches on the bulkheads, and 6 inches over the 8-inch guns. A program of construction to be completed in 1912 requires the expenditure of 203,000,000 lire on the vessels not yet completed and 5 more armor-clads of 10,000 tons to be built before 1905; from that date till 1909 the expenditure of 139,000,000 lire on 5 more 10,000-ton armor-clads, 1 smaller one, 2 auxiliary ships, and 11 torpedo-boats to replace some that are obsolete; and from 1909 to 1912 the expenditure of 77,000,000 lire to replace obsolete ships. The retrenchments forced upon the Government by its financial embarrassments necessitated the sacrifice by Italy of her rank as a first-class naval power, and only a few years of parsimony left the fleet antiquated and ineffective. When the financial position improved sufficiently the Ministry of Marine gave its at-

tention first to reconstructing and rearming the old vessels, and next to building a few new ones that would give Italy a modern navy, though not of the ambitious kind that she had when her ships and her guns were the biggest in the world. In 1900 the Government began to replace the superannuated vessels. In 1902 the annual allowance for ship-building was increased to 29,000,000 lire for five years. The appropriation for 1903 was applied to fitting out the *Benedetto Brin* and *Regina Margherita* and the cruiser *Francesco Ferruccio*, completing the *Vittorio Emanuele* and *Regina Elena*, and beginning 3 battle-ships of the same type. The Italian navy has contained a variety of ingenious designs, but uniformity of type is now considered desirable. One of the earliest submarines was built in Italy, and now after the other naval powers have adopted them the constructors of the navy are authorized to try their ingenuity on a new one.

Commerce and Production.—The production of wheat in 1900 was 45,030,000 hectoliters; of corn, 30,400,000 hectoliters; of rice, 5,950,000 hectoliters. The yield of olive-oil was 1,493,000 hectoliters; of wine, 29,900,000 hectoliters; of citrus fruits, 2,852,000,000 in number. The wheat-crop for 1901 was estimated at 52,000,000 hectoliters. The annual production of silk cocoons is about 50,500,000 kilograms; of silk, 4,470,000 kilograms. The production of sugar in 1900 was 30,820 metric tons, and in 1901 it was estimated at 55,000 tons. The mines in 1900 yielded 247,276 metric tons of iron ore, 6,014 tons of manganese ore, 25,800 tons of ferro-manganese ore, 95,824 tons of zinc ore, 35,103 tons of lead ore, 584 tons of silver ore, 5,840 tons of gold ore, 7,607 tons of antimony ore, 33,230 tons of quicksilver ore, 6 tons of arsenic ore, 4,005 tons of mixed ores, 71,616 tons of iron and copper pyrites, 479,896 tons of mineral fuel, 3,628,613 tons of sulfur ore, and minor quantities of salt, graphite, boric acid, petroleum, asphaltum, etc., the total product of 1,103 mines of all kinds, employing 67,748 persons, being valued at 85,060,000 lire. The marble-quarries employ 7,500 men, and their product is worth 32,831,000 lire per annum. The number of fishing craft in 1900 was 23,668, of 60,259 tons, including 185, of 1,791 tons, employed in coral fishing. The number of fishermen was 83,834, and of these the number engaged in deep-sea and foreign fishing was 8,446. There were 1,348 boats, of 15,399 tons, employed in the deep-sea fisheries in 1900, of which 160, of 2,352 tons, fished for coral. The value of fish caught in Italian waters in 1899 was estimated at 12,759,684 lire. The tunny-fish landed in Italy were valued at 2,564,099 lire. The quantity of coral was 391,127 kilograms, value 1,800,595 lire.

The special imports of merchandise in 1900 were valued at 1,700,235,665 lire; special exports, 1,338,246,253 lire. The imports of coal were 207,781,500 lire in value; raw cotton, 150,908,085 lire; wheat, 143,117,620 lire; machinery, 89,318,073 lire; raw and twisted silk, 74,406,350 lire; lumber, 54,578,100 lire; raw hides, 43,208,970 lire; wool, 42,821,940 lire; fish, 30,522,230 lire; horses, 29,284,800 lire; leaf tobacco, 22,221,312 lire; iron and steel bars, 21,429,992 lire; olive-oil, 17,994,333 lire; coffee, 16,207,085 lire; kerosene, 16,079,514 lire; raw sugar, 13,863,685 lire; linen and hemp yarn, 10,296,305 lire; cheese, 5,938,940 lire; cotton yarn, 5,128,606 lire; railroad materials, 4,009,120 lire; silkworm eggs on cards, 2,513,500 lire; cotton prints, 2,567,725 lire; dyed cotton cloth, 1,503,255 lire; bleached cotton cloth, 1,072,235 lire; indigo, 2,084,800 lire; unbleached cotton cloth, 546,145 lire; refined sugar, 327,744 lire; rice, 4,020 lire.

The value of raw and thrown silk exported was 349,061,500 lire; silk waste, 31,632,150 lire; cocoons, 1,431,960 lire; wine in casks, 57,378,248 lire; eggs, 50,035,440 lire; sulfur, 47,434,711 lire; hemp and flax, 43,937,737 lire; olive-oil, 31,936,708 lire; coral manufactures, 22,411,420 lire; raw skins, 21,583,935 lire; meat, fresh and salted, 17,000,185 lire; marble, 17,454,310 lire; cattle, 16,596,490 lire; rice, 16,467,445 lire; zinc ore, 12,305,700 lire; straw plait, 9,816,000 lire; cereals, 9,384,860 lire; dyes and tans, 7,794,871 lire; hogs, 3,978,610 lire; raw cotton, 2,610,400 lire; lead ore, 710,190 lire. The imports of precious metals in 1900 were 7,244,000 lire; exports, 16,553,500 lire. The values in lire of imports of merchandise from and exports to the principal foreign countries in the special trade of 1900 are given in the following table:

COUNTRIES.	Imports.	Exports.
Great Britain.....	81	100
Germany.....	25	100
United States and Canada.....	22	100
France.....	14	100
Austria.....	11	100
Switzerland.....	1	100
Russia.....	1	100
Argentine Republic.....	1	100
India.....	1	100
Turkey and Balkan States.....	1	100
Belgium.....	1	100
Spain.....	1	100
Egypt.....	1	100
Brazil.....	1	100
Central America.....	1	100

Navigation.—The number of vessels entered at Italian ports during 1900 was 103,601, of 30,107,329 tons; cleared, 103,439, of 30,148,455 tons. At Genoa 5,938, of 4,833,260 tons, were entered and 5,926, of 4,816,550 tons, cleared; at Naples 6,093, of 3,356,435 tons, were entered and 6,073, of 3,357,595 tons, cleared; at Leghorn 4,080, of 1,761,643 tons, were entered and 4,082, of 1,770,116 tons, cleared; at Messina 3,348, of 1,083,244 tons, were entered and 3,346, of 1,681,573 tons, cleared; at Palermo 3,372, of 1,658,848 tons, were entered and 3,378, of 1,669,662 tons, cleared; at Venice 3,097, of 1,288,940 tons, were entered and 3,105, of 1,302,776 tons, cleared; at Catania, 3,349, of 1,245,954 tons, were entered and 3,345, of 1,245,526 tons, cleared.

The merchant navy on Jan. 1, 1900, consisted of 5,665 sailing vessels of over 50 tons, having an aggregate tonnage of 658,224 tons, and 409 steamers of over 100 tons, having an aggregate tonnage of 873,064 tons.

Railroads, Posts, and Telegraphs.—The length of railroads on Jan. 1, 1900, was 9,610 miles. The number of passengers carried in 1899 was 57,914,709; tons of freight, 1,482,016 tons by express and 22,370,910 tons by slow trains. The passenger receipts were 112,882,545 lire. The total gross earnings were 305,764,483 lire, and expenses 216,847,919 lire. Most of the railroads belong to the Government, but since 1885 they have been leased to private corporations for sixty years, or for forty or twenty years if the Government exercises its option of terminating the contracts earlier.

The post-office in the year ending June 30, 1899, carried 276,921,850 postpaid letters and postal cards, 46,432,041 Government letters, 8,455,358 manuscripts and documents, 287,042,103 newspapers and printed enclosures, and 11,844,531 money-orders of the total amount of 887,921,232 lire.

The length of telegraph-lines belonging to the Government on June 30, 1899, was 24,459 miles, with 80,123 miles of wire; of railroad lines, 1,908

miles, with 22,340 miles of wire. The number of paid domestic telegrams in 1899 was 7,896,081; foreign telegrams, 1,164,403. The length of telephone-lines was 280 miles, with 375 miles of wire; number of conversations in the year, 111,772. The receipts of the post-office in the year ending June 30, 1899, were 59,667,014 lire; of telegraph offices, 14,611,268; total expenses, 58,990,597 lire.

Politics and Legislation.—Zanardelli, the last surviving statesman of the historic Left, took the premiership, and the supple Giolitti became Minister of the Interior after Gen. Pelloux, the last of a series of Conservative ministers who had trouble with the revolutionary parties, himself appointed to deal in military fashion with revolutionists and labor organizers, nearly provoked a revolution with his public safety bill. The Radical Minister had to rely on Socialist support, and its guiding principle was, not the prevention of social disturbance, but the repression of disorder. The Socialists organized labor unions and leagues of resistance throughout the country without interference from the Government. The agricultural laborers formed leagues. The labor party increased to over 1,000 sections with over 50,000 members. Strikes took place everywhere, at the rate of 1,000 a year, often successful; but only one was accompanied with violence, and only then did the Government interfere.

The traditional Radicalism of Signor Zanardelli and the Socialistic affiliations of Signor Giolitti were reflected in the speech from the throne delivered by King Vittorio Emanuele at the opening of Parliament on Feb. 20. In the reference to foreign relations the Government could boast with better reason than its predecessors of being in a position to defend Italian interests by fidelity to alliances and cordial bonds of friendship and of securing the esteem of foreign nations by a policy mindful of every right and duty. The Government promised to reduce the price of salt and to build extensive public works for the development of Apulia and Naples. The separation of religion from the civil powers was to be maintained, the clergy honored when confined to the sanctuary. The Radicals were expected to introduce divorce in Italy, since France and other Catholic countries have divorce laws now, but the action of Count Giusso, a Conservative member of the Cabinet who leaned toward Clericalism in resigning because his colleagues contemplated a divorce bill, though they were not ready to introduce it immediately, not having prepared the country for such an innovation, precipitated the bill, which was described as a proposal to deal, in harmony with the common law of other nations, with the ideal principle of the indissolubility of civil marriage and to reform by just regulations the law which deprives illegitimate sons of any right to a name and a career. A bill on judicial reform was intended to secure a higher degree of respect for the magistracy and confidence in the administration of justice. Labor legislation occupied a prominent place in the program. In addition to the increase by a recent law of the old-age pension fund and bills already submitted to Parliament, other measures were promised for relieving the working classes and developing social legislation, especially a bill on labor contracts. The happy consequences of the new civilization were said to be that labor is honored and strengthened by equitable compensation and prudent protection, raising the condition of those abandoned by fortune. The speech dwelt on the work of the Government for social justice and peace, on the pacification obtained

by the policy of harmonizing law and liberty because there was a rock ahead on which this policy must split, and the Government was compelled to take preventive measures in defiance of the Socialists, indicating its purpose by a reference to public peace, strongly protected. Among the many classes of laborers that formed unions were the railroad employees, who demanded of the companies higher wages and a classification and grading of their positions, with regular scales of pay and promotion. This organization of the men was a condition in the contracts when the companies leased the railroads, but had never been fulfilled. The Opposition watched with eager anticipation the development of a situation in which the Government must either break with the Socialists and resort to the Conservative policy of suppressing labor organizations in order to prevent strikes or face the consequences of a tie-up of the railroads. The ministers found a logical and legal way out of the dilemma and indicated their policy plainly enough in good time. The railroad employees were public servants, and if two or more of them combined to stop working they would commit an unlawful act. In their case it was the duty of the Government to prevent a strike, and a correlative duty was to bring pressure to bear to make the companies pay fair wages and to compel them, if necessary, to carry out the terms of their contract. The Socialists would not support a policy restricting in any way the right of workers to strike. They issued a declaration that the *bourgeois* Cabinet had enabled them to organize throughout the country and could offer nothing more worth having, hence they renounced the alliance and would be independent. They set up a candidate for president of the Chamber, and consequently the Government candidate failed to get an absolute majority of votes. Having no longer a majority to support them, the ministers on Feb. 21 offered their resignations to the King, who proposed to Signor Zanardelli the reconstruction of the Cabinet, as no other leader could form a combination and Signor Giolitti, who had secured Socialist support for the ministry, was bent on retiring now that this support was withheld. He was persuaded to remain, all the ministers yielding to the persuasion of the King. They decided to put their policy toward the railroad workers to the test of a vote of confidence. Labor disturbances in Turin in connection with a gas strike were met by strengthening the garrison. The threatened railroad strike was forestalled by an order placing on a military footing all railroad men who were liable to service and calling out one class of the army reserves. About 24,000 out of 86,000 railroad employees were under the age of forty and subject to the order of militarization, the effect of which was to place them under martial law and subject them to the penalty for desertion in case they left their posts. They wore badges to signify that they were under military orders, and, unlike the men who in 1898 in a similar contingency had been militarized in the same way, they received their pay as soldiers in addition to their wages on the railroads. The ultimatum of the railroad employees expired on Feb. 10, but the time was extended till March 4, as the railroad companies offered to raise wages to the extent of 1,700,000 lire a year and to discuss the question of fixed scales of rank, promotion, and salaries, which was already before the courts of law, the Government having brought suit to compel them to introduce such a system according to agreement. In 1905 the

railroad conventions will expire, and while the men aimed to strengthen their position before their renewal, the Government hesitated to bring pressure upon the companies lest any concessions gained from them now would be advanced as a ground for more lenient conditions to be given in the new contracts. The Government urged the companies to make concessions to the men. The companies offered to present a scheme of bureaucratic organization provided the Government would withdraw its suit. This the Government would not do. Besides the militarization of railroad employees, the Government called out the reserves of the class of 1878, some 55,000 men. On Feb. 23, on receiving a report that a strike was to be proclaimed immediately, the Government seized the telegraph-lines and for a day and a half let no private messages go over the wires, so that no strike orders could be sent. War-ships were sent to Naples, Leghorn, and Genoa to have marines present to aid the police. The railroad strike was settled by an agreement to pay the men 42,000,000 lire in increased wages, of which the Government contributes 33,000,000 lire and the companies 9,000,000 lire, in the next three years, after which the railroad conventions will be renewed and the men will formulate their demands for the future. When Parliament reassembled on March 10 the Opposition voted for the Government candidate for president, Signor Biancheri, who received 350 votes, while Signor Costa, the Socialist candidate, received 24. Thousands of peasants belonging to the agricultural Socialist leagues in the north of Italy, struck work, and Signor Giolitti, when charged by the Conservatives with permitting the growth of a subversive Socialistic movement, said that before social peace could be restored the wealthy classes would need to make more sacrifices to the just demands of the proletariat. On the question of confidence in the policy of the Government, a section of the Extreme Left once more voted with the ministerial party and 45 others abstained from voting, giving the Cabinet a majority of 250 to 158. The portfolio of Public Works was given on March 27 to Nicola Balenzano, a southerner, like Count Giusso. The reservists of 1878, who were called to arms for three months, became restive after the railroad troubles were settled, and in Piacenza, Milan, and other places they made public demonstrations in favor of immediate discharge. The Minister of War issued a circular ordering the prevention of further insubordination, and in the Senate endeavored to minimize the incidents, and said that discipline was restored. His own military prestige could not be restored, and on April 28 he resigned. Admiral Morin took charge of the department until a successor was found on May 14 in Gen. Giuseppe Ottolenghi. The immediate occasion of Gen. Ponzà's retirement was an altercation between Signor Giolitti and Gen. Pelloux by which the latter, a corps commander, deserved either a reprimand or justification. Gen. Pelloux, who had obtained a bill of indemnity for the militarization of railroad men by order of his predecessor, the Marquis di Rudini, argued that the present ministry ought to legalize their action in the same way. The Minister of the Interior was indignant that the legality of the proceeding should be called in question and accused the ex-minister of seeking to undermine discipline in the army. Agrarian strikes, which generally failed in the north, broke out in Apulia, where there was more misery, and the strikers became disorderly and were quelled by carabinieri. The Chamber authorized the ex-

penditure for an aqueduct from the Apennines through the province of Apulia to cost 200,000,000 lire, of which the state and provincial authorities contribute 125,000,000 lire and 75,000,000 lire will be furnished by a company which has the concession for ninety-nine years. This is the most important work yet undertaken in Italy, and another project for the development of the South is the improvement of communications between Rome and Naples. A score of bills were passed in haste just before adjournment on July 1. Early in the year, at the close of the previous session, Parliament sanctioned the gradual reduction of *octroi* duties on bread and flour, together with measures for compensating the consequent loss of revenue. The economical distress prevailing in the southern provinces, aggravated by these local duties and other fiscal burdens and by a temporary financial crisis resulting from easy credit at usurious interest, was caused by the destruction of forests, the injury wrought by the phylloxera among the vineyards, and depreciation of the olive-crop.

The trial of Raffaele Palizzolo, an ex-Deputy and man of wealth and influence in Sicily, which lasted eight months and resulted in his conviction and that of his agents in crime, and sentences of thirty years' imprisonment for each on July 30, was a victory of the Italian Government over the Mafia. Emanuele Notobartolo at the time of the bank frauds in 1893 was appointed by Premier Crispi president of the Bank of Sicily. Palizzolo, who was a director and one of the chief looters of the bank, procured his removal before he had completely unearthed the rascalities and fastened them on their authors. Public opinion compelled the Government to reappoint him, but on the journey to Palermo he was shot dead through the window of a railroad-carriage. The trainmen and all who might know, and even the police, as is usual when crimes against life occur in Sicily, helped to cover the tracks of the criminals. Lieut. Notobartolo hunted the murderer of his father for years, obtained proofs that Palizzolo had procured this murder and that of Francesco Miceli, steward of an estate that Palizzolo sought to acquire by fraud, and denounced him and his accomplices who committed the murders in 1899. The Sicilian judges pretended to investigate the case, and after several fruitless examinations the venue was changed to Bologna, where a jury found the three guilty. In Naples and Calabria the Camorra is as powerful as the Mafia in Sicily. A bandit named Musolini, who had combined robbery with private vengeance and pursued a career of blood for many years with the connivance of all the people in his district, was caught at last, and after a trial at Lucca was sentenced to imprisonment for life.

The laws and local government suited to Lombardy and Piedmont when extended to the old kingdom of Naples proved too complex and costly. The land tax has reached 39 per cent. of the valuation. Baron Sonnino proposed to reduce this one-half, and also the 34-per-cent. interest of mortgages held by the state banks, amounting to 100,000,000 lire. Premier Zanardelli's proposal is to reduce the land tax on small farms, new buildings, and lands which have been re-afforested, and to exempt from income tax new farm buildings, grazing land, and workmen's wages throughout Italy, and to reduce the salt tax. In strike riots at Candela soldiers were stoned and at Giaratana some of them were killed. They fired and killed many peasants, and the ministers who defended their action were assailed by the Socialists. But the Extreme Left

was no longer a solid phalanx of 100 members. It was divided into half a dozen warring factions. The Socialists, who denounced anarchists and ridiculed Republicans, were themselves divided into irreconcilable schools. The revolutionary Socialists, led by Prof. Ferri and Andrea Costa, who have been most active and numerous, were defeated in the party congress at Imola in October by the evolutionary or opportunist group, the leader of which, Signor Turati, had been read out of the party in the spring as too lax and lukewarm in his socialism. The question of divorce was brought forward by a Socialist who introduced a bill in Parliament, the principle of which was approved by members of all parties, even Conservatives, who considered it unjust that, while the wealthy can obtain recognition in Italian courts of divorces they have obtained in foreign countries or sometimes get a divorce in the form of an annulment of marriage by the Church, for the poorer classes marriage is indissoluble. The Premier deemed it imprudent to leave this question in the hands of the Socialists, especially since the Pope delivered an allocution against divorce and the Clericals started an agitation against divorce. A Government bill was introduced, but was not pushed forward because public opinion was not yet ripe.

Foreign Relations.—After the occupation of Tunis by France in 1881 with the consent of England and Germany, Italy appealed in vain to Austria and Germany to protect her Mediterranean interests, which were in no way guaranteed by the triple alliance. She complained of the French naval station of Bizerta as a menace to Sicily, and though her allies declined to intervene, France abstained from going on with the fortifications. A naval agreement was made with England in 1887, when the triple alliance was renewed, for the preservation of the *status quo* in the Mediterranean. In 1896 the convention with Tunis expired, and a new one was concluded with France in which French suzerainty over the regency was recognized and Italy abandoned her rights under the capitulations. In 1898 England offended Italy by recognizing as within the French sphere of interest the Tripolitan Hinterland. The Italian Government sounded the European cabinets with regard to an eventual occupation of Tripoli. Germany disclaimed any interest in the matter; France could recognize no right to appropriate a Turkish province and had no desire to occupy Tripoli herself, having given assurances to the Porte to that effect, but she had no interest in placing obstacles in the way of any action of Italy; England disclaimed all intention of occupying Tripoli, but declined to contract an engagement to support Italy in such an enterprise and was in general opposed to the vivisection of Turkey. Italy assured France that she had no objections to the French occupation of the oasis of Tuat and that occurrences in the Hinterland of Morocco could not be considered as a Mediterranean question. When afterward the French made incursions into the Tripolitan Hinterland to punish tribes for raiding territory under French protection Italy invariably asked explanations, and those that were given were evasive and unsatisfactory. When the trade relations between Italy and France improved Italy asked for a categorical statement and a formal assurance, and was reminded that she had joined other Mediterranean powers in urging the Sultan of Morocco to oppose the extension of the Sahara Railroad as dangerous to his dominions, which he declined to do unless the same powers would guarantee him against receiving any detri-

ment. The result of the *pourparlers* thus opened was a formal declaration on the part of Italy that she would not oppose any development of French power in Morocco and of one on the part of France that she would not encroach upon Tripoli nor oppose in any way the eventual Italian occupation. England afterward formally declared that she would not object to the annexation by Italy of Tripoli and would suffer no encroachment by Egypt on the eastern frontier. Italy and Austria-Hungary had an agreement to preserve the *status quo* in Albania, where Italian trade and education were fostered by the Italian Government. After an understanding was reached with France the fortification of Bizerta was resumed and the port opened as a great naval harbor. An Italian fleet visited Toulon. King Vittorio Emanuele visited various European courts in the summer of 1902, but not the court of Vienna, which preserves relations with the Vatican that preclude royal visits between the courts. He went to Berlin, but his first visit was to the court of the Czar, where Signor Prinetti and Count Lamsdorff discussed the concordance of Italian and Russian interests in the Adriatic and the Balkans. An Italian fleet visited Tripoli as a sign of the claim, now formally recognized, of the heritage of Italy in this part of the Turkish Empire. The fleet was received with courtesy, but the Porte at the same time increased the garrison and strengthened the fortifications. The Italian squadron visited later the Adriatic ports of Turkey and Montenegro. The Italian Government made a demand later on the Porte that the pirates of the Red Sea be suppressed, and before the Turkish war-vessels appeared Italian ships captured and punished some of the offenders. A diplomatic conflict arose in the spring between Italy and Switzerland. The Italian minister in Berne, Commendatore Silvestrelli, called the attention of the Swiss Federal Council in the summer of 1901 to attacks on the royal family of Italy printed in the anarchist journal *Risveglio* of Geneva. He did not urge the matter, but in the spring of 1902, when articles appeared praising the murder of King Umberto, he called on the Federal authorities to prosecute the editor under the Swiss penal code for inciting to crime. The Federal Council replied that there was no infraction of the law he cited; but if he would appeal in the name of his sovereign for proceedings to be taken against the editor based on any article vilifying the King of Italy, action could be brought under the law for the protection of foreign sovereigns, which required such a preliminary request. He did not wish a trial in which scandalous stories about the royal family could be repeated, and therefore he demanded the application of the penal law against incitement to murder. The Federal Council resented his pretension to interpret Swiss law, and requested his recall when his imperative demand was repeated. The Italian Government declined to recall the minister, and in consequence the Swiss Government broke off diplomatic relations with Italy in April. Through the mediation of Germany direct relations were resumed in August, when both governments appointed a new representative.

Dependencies.—Eritrea is an Italian colony embracing the port of Massowah, on the Red Sea, where Egypt had a garrison before the evacuation of the Soudan, and a Hinterland formerly claimed by Abyssinia and ceded to Italy in the treaty of Ucciali, signed May 2, 1889. The treaty of Adis Abeba, signed Oct. 26, 1896, in which Italy renounced the claim of a protectorate over Abyssinia, concedes to Italy all territory north of

the Mareb, Belesa, and Muna rivers. The delimitation of Eritrea from the Egyptian Soudan was arranged in a treaty signed April 15, 1891, supplemented by the protocols of Dec. 7, 1898, June 1, 1899, and April 16, 1901, and the Anglo-Italian agreement of Nov. 22, 1901. The boundary starts from the coast at Ras Kasar, runs to Barca, and thence to Sabderat, near Kassala, and from that point due south to the Atbara. The colony is administered by a royal Commissioner under instructions from the Italian Minister of Foreign Affairs. Ferdinando Martini was Commissioner in 1902. The area is estimated at 88,500 square miles, with 450,000 inhabitants, mostly Arab nomads. The Europeans number about 2,000. The expenditure for the year ending June 30, 1901, was estimated at 10,430,500 lire, of which local taxation produced 2,229,700 lire and 8,130,800 lire were contributed by the Italian Government. Camels, cattle, sheep, and goats find plenty of pasture, but agriculture will not be possible without irrigation. Meat, hides, and butter are exported and mother-of-pearl and pearls, which are produced to the amount of about 1,050,000 lire per annum. An Italian company organized in 1898 received the rights of the pearl fisheries and contracted to cultivate mother-of-pearl oysters. The total value of imports at Massowah in 1900 was 9,376,543 lire, and of exports 2,745,470 lire. There were 2,939 vessels, of 129,499 tons, entered and 2,929, of 129,349 tons, cleared. A railroad, 17 miles long, from Massowah to Saati, is being continued to Asmara, the seat of the administration; and a telegraph-line is to be constructed to Adis Abeba, the capital of Abyssinia. A telegraph-line now runs from Massowah to Assab, 319 miles, and thence to Perim, 62 miles. The common unit of value is the Maria Theresa dollar, coined in

Austria. To take their place the Italian mint has coined 2,175,999 Eritrean dollars.

South of Abyssinia, on the Somali coast, Italy has a protectorate over the Sultan of Obbia and the Mijertain and occupies the ports of Brava, Merka, Mogadoscio, and Warsheik, which were ceded by the Sultan of Zanzibar in 1892. (See EAST AFRICA.)

The frontiers between Eritrea and the Egyptian Soudan and Abyssinia were settled by a convention with England and one with Abyssinia. The Anglo-Egyptian authorities agreed to transfer to Italy the territory between the Mareb and the boundary of the Soudan which Menelek had ceded to them, and he ratified the arrangement in return for the retrocession to Abyssinia by Italy of the *enclave* of Tomat. The Ethiopian Negus furthermore sanctioned the occupation by Italy of the Kunama country. He granted in another document mining, industrial, and trading concessions to Italians covering Tigré, Gondar, and the upper basin of the Takazze.

When the British operations against the Mad Mullah were extended so that it was desirable for a British force to pursue the foe into Italian Somaliland the Italian Government gave permission on condition that an Italian officer should accompany the expedition. At the same time Italian war-vessels endeavored to stop the importation of arms into Somaliland. The delimitation of French and Italian possessions on the Red Sea recognized territory north of Ras Dumeira as Italian, including Raheita. The Sultan of Raheita, whose predecessor ceded to Italy in 1870 her first African possession, the settlement of Assab, caused a disturbance which led to the annexation in May, 1902, of his dominion to Eritrea.

J

JAPAN, a constitutional empire in the Pacific Ocean, between the possessions of Russia and the United States, governed by the oldest continuous line of political rulers in the world. Of the unknown number of islands, of which more than 4,000 have been counted, about 500 are inhabited. Area, exclusive of Formosa, 147,655 square miles. Seventy-five per cent. of the people live on the main island, and the important part of the nation's history has taken place on the three islands of Hondu, Kiushiu, and Shikoku. The northern limit of the empire is fixed at 56° 56', and the southern at 21° 48' north latitude, the other boundaries being at east longitude 119° 20' and 156° 32'. By the census of 1898 the population was 46,558,297. With the normal rate of increase the figures would now show very nearly 50,000,000 souls, of whom 50,000 are registered as living abroad, 24,034 being in Western countries or possessions, 1,068 being students or in Government service. The money standard is gold, the yen being worth 50 cents. The present ruler, Mutsuhito, born in Kioto, Nov. 3, 1852, is the one hundred and twenty-second of the imperial line. His fiftieth birthday was celebrated with great popular rejoicings. He married in February, 1869, the Princess Haruko, born May 28, 1850, daughter of Prince Ichijo; but no children have been born of the union. The heir apparent, Prince Yoshihito, born Aug. 31, 1879, of the imperial concubine Yanagiwara Aiko, married, May 10, 1900, the Princess Sada, daughter of Prince Kujo, born June 25, 1884. Two male children, Hirohito, born

May 5, 1901, and Haruhito, born June 25, 1902, are the fruit of this union. The corner-stone of the new palace for the imperial prince, which is built of American structural steel, was laid on May 9, with imposing ceremonies in foreign style, these taking the place of the usual native customs at the completion of the roof-timbers. The civil list is 3,000,000 yen.

Since 1889 the Emperor has shared legislative powers with the Imperial Diet, consisting of two houses. By the new election law there is, besides 316 peers and imperial nominees in the upper house, an increase of 13 new members in the lower house, making 382. Franchise-holders must pay at least 10 yen in direct taxes. These now number 967,227. With numerous changes of the Cabinet since 1889, constitutional reform has been steadily continuous toward the British rather than the German system, and the general tendency of political life is toward democracy. The last lower house was the only one that lived out its full term, and the Katsura Cabinet, formed in July, still holds office. The seventeenth annual meeting of the Diet began Dec. 6, 1902.

The Emperor presides actively over the imperial Cabinet, which consists of the Ministers Present of State and 9 heads of departments. He is also assisted by a Privy Council of 20 veteran statesmen, who are especially influential in the appointment of the Mikado's servants, from Cabinet officers to consuls.

The Army.—The whole male population between the ages of twenty-one and forty is liable to military service, and the total number avail-

able is 600,000, divided into three classes: (1) The active army and reserve; (2) the army of depot and reserve, divided into classes; (3) the territorial army and reserve. Military service lasts three years in the active army and four years and four months in the reserve of the active army, seven years and four months in the first class of the army of depot, and one year and four months in the second class of the same army, five years in the territorial army, and eight years in the reserve of the territorial army. There are 12 military districts, in each of which is an army division, in addition to the Imperial Guard, which is stationed usually in Tokio. The actual military strength, including the police, is 7,650 officers, 162,000 non-commissioned officers and privates, and 30,000 horsemen, which on a war footing is increased to 8,055 officers, 221,074 non-commissioned officers and privates, and 44,000 horses. In the reserve are 950 officers, 33,389 non-commissioned officers and privates, and 5,000 horses. The territorial army consists of 3,198 officers, 125,564 non-commissioned officers and privates, and 21,000 horses. There are 19 regiments of artillery, each divided into three sections of 2 batteries, and each battery has 6 pieces. The field-pieces in use were invented by Gen. Arisaka, who was recently decorated by the Emperor for his services. They are quick-firing guns, with a caliber of 75 millimeters. In each of the 13 divisions are 2 brigades of infantry, each of 2 regiments of 3 battalions of 4 companies, 1 regiment of cavalry (3 squadrons), 1 regiment of artillery, and 1 battalion of engineers (3 companies). To each division belongs 1 "état-major" chosen from experienced officers who have been graduated at the Academy of War. Besides the 13 divisions are 2 brigades of cavalry, 2 brigades of field-artillery, and 15 battalions of fortress-artillery. The active army is equipped with the Arisaka rifle, adopted in 1897. It has a caliber of 6 millimeters and fires a projectile of 22 grams, with an initial velocity of 725 miles. The Murata rifle, used in the Chino-Japanese War in 1895, and in use by the reserve and territorial armies, has but 580 miles of initial velocity. There are training-schools in every branch of the service, and all the cannon, small arms, and ammunition are made in the Government arsenals at Tokio and Osaka. The Red Cross Society has a membership of 728,507 members, a total income of 4,657,575 yen, and 2 fully equipped hospital ships.

The Navy.—Within seven years after seeing Commodore Perry's war steamers in Yedo Bay, the Japanese navigated a steamer of their own across the Pacific, and naval development has since made steady progress. There are five maritime districts, in three of which are thorough facilities for the repairing and building of ships. Of the post-bellum program, formulated in 1895, from 57,900 tons in 1894 to 200,000 tons by 1905, there are now afloat and in commission 6 new battle-ships of 276 guns (the Mikasa, of 15,362 tons, arrived in May, 1902); 2 old battle-ships of 46 guns; 10 old battle-ships for coast-defense of 99 guns; 6 first-class cruisers with 103 guns, 2 first-class gunboats with 19 guns, making with despatch-boats, torpedo-destroyers, and torpedo-boats, 59 ships with 1,110 guns; besides which, a fleet of between 20 and 30 modern vessels are kept in reserve, ready for service. At first it was difficult to get sailors, but now the needs of the navy are amply met in this respect, the great difficulty being to secure trained officers, especially those in the lower grades. While the tonnage has increased 400 per cent., the number of men has increased but 100 per cent., or from

17,140, in 1895, to somewhat over 33,000 in 1902. There is only one naval college, at Edajima, capable of accommodating 600 cadets, another being planned for Yokosaka. Great improvement has taken place in the weight of the personnel of the navy. The average body weight of 19,983 persons, measured in 1886 and in 1901, shows an increase from 123 to 126 pounds. The total military expenses of Japan on land and water average per head of population 1.74 yen, against 2.60 of administrative expenses, and much less than that of any other country.

Resources.—The total available wealth of Japan is reckoned by her own economists at 15,000,000,000 yen, but the large number of enterprises required to change the nation from an insular and agricultural to a commercial, manufacturing, and maritime people has made a drain upon the ready capital of the country, which has revealed at once both its wealth and its poverty. The rates of interest are being lowered, and the gold reserve in the Bank of Japan has been substantially increased, showing greater financial stability. On Oct. 1, 1897, Japan adopted the gold standard. The coins issued in 1901 amounted in value to 15,949,645 yen. The coinage of 1901, compared with that of 1900, shows an increase, chiefly in gold, of 2,100,059 yen. Largely through defects of management the postal savings-banks show but 2,275,680 depositors, or 4.8 per cent. of the population, which in 1901 averaged in deposits 11.77 yen, making a total of 26,806,859 yen. In the same year 6,248,700 yen were sent home from Japanese living abroad.

Finances.—The expenditures of recent years have raised the aggregate debt of the cities and prefectures from 8,093,801 yen in 1893 to 33,187,806 yen in 1901. The national unredeemed debt in 1900 was 503,200,664 yen or 11.5 per person. The chief items of national revenue are taxes on land, saké, income, business, sugar, soy, customs, and stamps, the revenue derived from posts and telegraphs, state monopolies, railways, and in recent years the Chinese indemnity, making a grand total in the budget of 1902 of 273,631,176 yen; the total expenditures amounted to 270,424,495 yen, these in their order being for the departments of Finance, Communications, War, Navy, Home, Justice, and Education. The trial budget for 1903 shows a revenue of 256,000,000 yen and an expenditure of 262,000,000 yen. Among the items are the custom-house works at Kobe, 3,500,000 yen; riverine works, dikes, etc., a census on scientific principles, 450,000 yen; telephones, 1,450,000 yen; various industrial outlays, including a subsidy for the St. Louis Exposition, amounting in all to 5,500,000 yen. Among the details of the foreign offices appropriations of 6,500,000 yen are allowances for 4 new consulates and 9 honorary consulates, all in China and Korea. The cost of military operations in China for the year ending March 31, 1902, was 13,887,920; of sending a squadron to England for the coronation, 397,841 yen; of overseeing the elections, 119,690 yen; of floating and repairing stranded men-of-war, 288,618 yen; of gathering up bodies from the Awomori disaster and for funeral rites, 150,000 yen. Through Messrs. Baring Brothers a loan to the Japanese Government for 5,000,000 yen at 5 per cent. interest was subscribed several times over in London. There are 2,414 banks in the empire, with a total capital of 517,766,000 yen. In Formosa, where silver is temporarily the standard, 1,256,252 pieces of silver yen of the same type of the old coinage system were struck at the Osaka mint in 1901 to serve as the reserve fund for the notes of the Bank of Formosa.

Hokkaido.—The Hokkaido, especially in Yezo, is developing in all lines of industry, notably in harbor improvement, placer mining—in which American placer diggers have introduced great improvement since 1900—in the opening of new ports, and in the working of coal-mines and petroleum wells. Muroran, opened as a port of export in 1894, is now the third largest port in Japan and the chief coaling-station of steamers between North America and China. In 1901 89 foreign steamers, of 190,921 tons, and 7 Japanese steamers, of 42,035 tons, entered the port. Hakodate is the chief port, able to accommodate 109 vessels of 5,000 tons, while Muroran can harbor 38. Otaru is the next port of importance. The total population of the Hokkaido in 1899 was 58,467; in 1899, 922,508; in 1901, 1,020,000; total trade in 1901, \$450,000.

Products and Enterprises.—Contrary to early supposition, Japan is not rich in minerals, yet the total mineral output in 1900 was 49,936,378 yen, showing an increase of 4.5 times, compared with a decade ago. The value per person in 1898 was 0.91, compared with England's 19.23, Austria's 3.91, and Russia's 1.15. Most branches of the mining industry are, as to the methods employed, still in their infancy. The output of iron in 1900 was 23,632 tons, worth 956,000 yen in value. Japanese coal is of two kinds, the soft and the hard, which latter is greatly inferior to British coal. In 1900 7,429,457 tons were mined, to the value of 24,583,038 yen. In petroleum, Echigo leads. The total output of Japan in 1900 was 31,000,000 gallons of oil, worth 1,941,518 yen. Of sulfur, 14,435 tons, worth 312,835 yen, were mined.

The import of petroleum in 1901 was 55,197,080 gallons, worth 14,943,400 yen. Despite the imported supply, the demand for Echigo oil, which supplies three-tenths of the petroleum used in Japan, has increased. In 1895 6,334,160 gallons, worth 526,976 yen, and in 1901 44,632,280 gallons, worth 2,345,916 yen, were produced. Refined native petroleum is equal to the best American and Russian oils.

The average rice-crop for the seven-year period ending in 1901 was 204,281,085 bushels. The crop for 1902 is 2.6 per cent. below the average, and 15.2 per cent. below last year's crop, or 179,023,195 bushels.

In 1900 the Japanese constructed in their own dockyards 77 steamers, aggregating 12,828 tons, and 48 sailing ships, with a tonnage of 16,243, while buying abroad 346 steam and sailing ships, with a tonnage of 133,668. In Japanese waters 7 vessels or steam-yachts are engaged which use the harpoon gun to hunt the minor species of whales.

The mercantile marine shows a total tonnage of 648,328, of which 179,894 are of sailing ships and 477,430 in steamers, making her, as to power of steam sea transit, sixth on the list of the great nations of the world—ahead of Russia and Sweden, and only slightly below Spain and Italy.

In Yokohama dwell 5,588 foreigners, of whom 3,550 are Chinese, 915 British, and 452 Americans.

Emigration to Korea increases steadily. In 1902 44,000 Japanese went thither.

Trade and Labor.—For the first time, the volume of exports and imports has exceeded 500,000,000 yen, the exports being in value 248,000,000 yen, or 44,000,000 yen larger than last year's figure; whereas the volume of imports was 253,000,000 yen, being 33,000,000 yen less than last year, the total bulk of the trade showing an increase of 11,000,000 yen, and the imports exceeding exports by only 5,000,000 yen.

The silk trade shows in exports an increase from 7,743,393 pounds, worth 47,866,256 yen in 1895, to 11,537,924 pounds, valued at 74,460,947 yen, in 1901. Up to 1900 the United States took 0.6 of Japan's sales of silks, but last year the American share was 0.7.

The number of American and European firms in Japan is decreasing. At Yokohama in 1899 there were 303, while in 1900 there were but 241. Whereas in 1898 the value of exports from Japan amounted to 13,823,843 yen and the imports from China 21,344,521 yen, the exports in 1901 were 42,925,579 yen and the imports from China 27,265,986 yen, or a total volume in 1891 of over 70,000,000 yen.

It was permitted until July, 1902, to establish an exchange with a capital as small as 30,000 yen, but the Government now requires a capital of 100,000 yen, and the time of the transactions in negotiable securities must not be for a longer period than two months; the previous limit was three months.

The chief imports from the United States are raw ginned cotton and petroleum, these two making up more than half the value of the whole, and different kinds of machinery, engines, electric apparatus, etc. The value of exports to the United States was \$36,010,060, and of imports \$21,299,176. This was by far the largest bulk of traffic with any Western country, and more than twice as much as with any country except China.

In 1892 about one-eleventh of Japanese trade was carried in native bottoms. In 1901 about three-fourths of the exports and imports was moved in native vessels. In 1901 the Japanese steamer tonnage in Japanese ports was 3,861,659, and was surpassed only by British ships, with a tonnage of 4,080,583. Germany and Russia both exceeded the United States, only 175 American ships, with a tonnage of 404,724, entered Japanese ports.

The Japan Steam Mail Company, which has lines of steamers making regular trips to ports in Europe, America, Australia, British India, China, and Korea, have begun the establishment, in connection with the Hunan Company, of China, of a line of steamers in the Yangtze valley, in order to secure feeders for their steamers at the Shanghai terminal.

In 1901 185,000 tourists traveled in Japan or stopped over during steamer calls, and it is computed that they spent \$20,500,000 in the country.

Education.—Japan has now four universities, two of them being on Government foundation, at Tokio and Kyoto respectively, and two in Tokio under private auspices. Commissioner Wu, sent out by the Chinese Government, has been for three months investigating the various grades of Japanese schools and their methods. There are 43 public libraries, with a total of 728,067 volumes, of which 65,595 are foreign. One in Tokio, on Government foundation, has 401,519 volumes. Fifteen libraries, with a total of 169,946 books, have been established by local authorities, and 27 libraries, with a total of 156,602 volumes, established by private individuals. A new public library, opened June 15 in Tokio, was founded by the late Mr. Ohashi, who made his money in publishing standard Japanese literature, chiefly fiction in cheap form. He devoted 125,000 yen for its building, equipment, and maintenance. At Osaka Mr. Sumitomo bestowed 200,000 yen for a public library. Another instance of private liberality is the mercantile school of Mr. Okura.

Religion.—In 1901 the number of Protestant missionaries was 782; of churches, 456; of mem-

bers, 46,634; and the money raised by natives amounted to 117,817 yen.

The Roman Catholics have 1 archbishop, 3 bishops, 109 foreign missionaries, 34 native priests, 201 churches and stations, and 55,824 members.

The Russo-Greek Church has 4 foreign missionaries, 283 native priests or evangelists, and 26,680 members, who contributed 7,364 yen to Christian work. In Tokio there are 23 Christian sects, 103 church-buildings, 127 foreign missionaries, and 66 native pastors. The Buddhist sects show considerable activity, and have adopted not a few features of work and methods borrowed from the Christians. The Salvation Army has been active in the reformation of the social evil. In 1899 there were in the empire 52,274 prostitutes, and in 1901 there were but 40,195, with a heavy decrease in visitors to brothels and in brothel receipts, largely through the regulation granting "free cessation" to prostitutes. The total decrease of numbers in 1901 was 23 per cent.

Politics and Events.—On Jan. 23 Major Yamaguchi with a battalion of infantry left Awamori to practise marching in the snow; but, owing to the heavy storm, they were overwhelmed and most of them were frozen to death, there being only 12 survivors of the 210. The sum of 1,830 yen was raised by the foreigners in Japan for the relief of the families of the dead, and 150,000 yen was appropriated for the same purpose by the Japanese Government. The cold weather was exceptional, some places in the Hokkaido showing 40° below zero.

Major-Gen. Arisaka was awarded by the Emperor the second-class order of the Rising Sun and a donation of 2,000 yen for his inventions in arms and ammunition.

On Feb. 11, on the date of the promulgation of the Constitution, announcement was made of the conclusion of an alliance between Japan and Great Britain, and great popular rejoicings followed. Its objects are to maintain the *status quo* and general peace in the extreme East, and especially the independence and integrity of the Chinese and Korean Empires, and to secure to the signatories full and free enjoyment of the opportunities created by treaty. During the year the agitation of the payment by foreigners of a house tax was kept up, the matter being finally referred for arbitration to the International Tribunal at The Hague.

The session of the Diet closed March 10. Of 79 Government bills presented during the 29 sessions of the lower house, 69 were passed. Of 5 bills sent down from the upper house, 1 was passed. Of 94 bills presented by its own members, 37 were passed. The House dealt with 146 measures in all, most of the work being done in committee. In the upper house, of 42 Government bills received, 36 were passed. Of 36 bills sent up from the lower house, 17 were passed. Of 5 bills presented by the peers themselves, 1 was passed. The relations between the two houses were, during part of the time, rather unpleasant.

A great fire broke out in Fukui, March 30, destroying 4,000 houses in the business part of the city. The princes of Riukiu (Loo Choo Islands), after years of expectation that China would resume rule over the archipelago, cut off their hair, put on foreign clothes, sent their children to the Government schools, and paid social visits in Tokio, where they now reside. After more than thirty years of retirement in Shidzuoka, Keiki, the last of the shoguns has been invited to the capital, to appear often at the court, and recently was exalted to a high degree in the nobility.

Marcus island, occupied by the Japanese for some years, was visited by the Kasagi, man-of-war, the Japanese Government having been formally notified that the United States had no claim. It was discovered by a Japanese in 1879, and was formally annexed in 1898 under the name of Minami-Tori Shima.

The imperial Postal Department celebrated on June 25 the twenty-fifth anniversary of its entrance into the Universal Postal Union by the issue of memorial postal cards, in a set of five, of elegant execution.

The faction fights, with a purpose of ethical reform, in view of the licentiousness of the abbots and priests in the Shinshiu sect, the richest and strongest sect among the Buddhist denominations, were continued during the year with personal violence.

A great typhoon, beginning below the Riukiu Islands, swept the coast of Japan for three days until the afternoon of Aug. 28, doing immense damage, unroofing or destroying edifices, demolishing wharves and breakwaters and the famous Red Bridge at Nikko, driving gunboats and battle-ships on the rocks, besides pouring a tidal wave 60 feet high over the Odawara district, which spent its force a half-mile inland, lifting bodily a railway from its bed, covering rice-fields with sand, and killing or drowning more than 300 persons, besides overturning railway-trains.

This year the Chinese Imperial Government and local authorities summoned to their assistance in China about 50 Japanese teachers, railway engineers, experts for industrial enterprises, legal advisers, chiefs of police, and other helpers in various lines of progress.

Formosa.—The area of this island, ceded by China to Japan in 1895, including adjacent islets, is 5,535 square miles. The number of obnoxious insects has greatly decreased, and the death-rate among the Japanese has decreased by more than 75 per cent. The twenty years' program of improvement, inaugurated by the Government, estimated to cost 35,000,000 yen, includes a trunk-line railway, a thorough survey of the whole land, and the settlement and confirmation of landholders' rights, harbor improvement, and the building of Government offices and residences, with drainage, water-works, etc.

The year 1902 was notable for a steady development of the physical resources of this island, for the education, tranquillity, and prosperity of the more civilized portion of the inhabitants, and for active military operations against the rebellious savages of the mountains and forests, resulting in hundreds of casualties on both sides, but with steady loss to the savages. In the national budget the subsidy for encouragement of navigation in Formosa amounted to 800,000 yen. The foreign trade of Taiwan in 1900 amounted to 24,141,949 yen, and in 1901 to 21,166,015 yen.

Besides 1,500 private schools attended by 25,000 pupils, there are 1,496 small elementary schools sustained by the Government, attended by 27,590 pupils, or 6 per cent. of the eligible children of school age. In the Pescadores 96 elementary schools were attended by 10,000 pupils. The principle is to Japonize as much as possible the natives, whose minds are impregnated with Chinese thought, and who are pro-Chinese in nearly everything. There are also medical and normal schools, besides a score or more in which the Japanese language and literature are taught.

The problem of malaria has been successfully attacked by segregating one battalion of infantry from the bites of mosquitos for one hundred and

sixty-one days, during which not a single case of malaria occurred, whereas 259 cases occurred in a battalion not similarly protected.

The Japanese population, mostly from Kiushiu and Osaka, numbers, exclusive of the military, more than 40,000, more than 8,000 having come in 1900. During the past five years of Chinese occupation imports increased from 7,127,534 yen to 9,254,010 yen, an increase of less than 30 per cent., against 140 per cent. increase for a similar period under Japanese rule, the total imports in 1900 being 22,009,695 yen. The entire revenue of the island is expended on local improvements, and 150,000,000 yen have been put into circulation. Modern improvements and industries are springing up all over the island. The city of Taihoku is virtually Japanese, cleanly built and well drained, with macadamized streets, brick and stone houses, and well-stocked shops. A thousand miles of ordinary roads, often with great engineering difficulties to overcome, have been constructed, and the old railways of Chinese days have been entirely reconstructed. There are now 93 miles of ordinary, and 200 miles of narrow-gage railway, and 1,400 miles of telegraphic wire on land. New cables to Japan, Foo-Chow, and the Pescadores have been laid, and several telephone-lines put in operation. Hospitals have been established in the leading cities, at which poor Chinese receive treatment. The actual revenue of the island in 1900 was 15,000,000 yen. The Director-General reports that from 1895 to 1901 the total amount expended by Japan, including military expenses, was 150,000,000 yen, the total revenue during this period being 40,000,000 yen, but the annual revenue now yields between 14,000,000 and 20,000,000 yen.

JEWES. The most important event of the year for the Jews of the United States was the arrival of Dr. Solomon Schechter, a native of Roumania, but for many years a resident of England, where he was reader of Rabbinic at Cambridge University and occupied a high place in the learned world. For some time negotiations had been in progress to secure his services for the Jewish Theological Seminary of New York. On its complete reorganization and ample endowment, largely due to gifts from Jacob H. Schiff, he left England and reached New York on April 17. His active duties as director of the seminary began in the autumn. The new institution is practically a post-graduate school; its course of study is broad and thorough, and its aim is to impart a wide scholarship. Prof. Schechter has been identified with positive traditional Judaism. His inaugural address, on Nov. 20, was a stirring plea for breadth and scholarship in Jewish seminary training. His view of Judaism was pithily expressed in the words: "Judaism is not a religion which does not oppose itself to anything in particular. Judaism is opposed to any number of things, and says distinctly 'Thou shalt not.' It permeates the whole of your life. It demands control over all your actions, and interferes even with your menu. It insists upon the observance both of the spirit and the letter. In a word, Judaism is absolutely incompatible with the abandonment of the Torah (law). We must leave off talking about Occidentalizing our religion, as if the Occident has ever shown the least genius for religion, or freeing the conscience by abolishing various laws. These and similar platitudes and stock phrases, borrowed from Christian apologetics, must be abandoned entirely, if we do not want to drift slowly but surely into Paulinism, which entered the world as the deadliest enemy of Judaism, pursued it through all its course, and

is still finding its abettors among us, working for their own destruction. There is no other Jewish religion than that taught by the Torah, confirmed by history and tradition, and sunk into the conscience of catholic Israel."

A further evidence of educational progress was the issue of the second and third volumes of the Jewish Encyclopedia, whose successful publication is now assured. It is difficult to overestimate the value of this undertaking, not only for the popularization of Jewish knowledge, but for the spectacle afforded of Christian and Jewish scholars in kindly cooperation. The Jewish Publication Society, which has now 4,808 members, issued several works in 1902: *Strangers at the Gate*, by Samuel Gordon; *Idyls of the Gass*, by Martha Wolfenstein; *Hearth and Home Essays*, by Esther J. Russkay; and the first volume of a new edition of Grace Aguilar's writings. The new edition of the Bible is under preparation; its first volume, the book of Psalms, is ready for the press. The expenses for the year reached \$14,984; receipts, \$15,271; permanent fund, \$17,145.

At the annual convention of the Central Conference of American Rabbis, held in New Orleans, May 7, the discussion of the Sabbath question aroused much interest. Papers were read on *The Jewish Religious School*, by H. H. Mayer; *The Bible and Modern Thought*, by S. Sale; *The Sabbath Question*, by Jacob Voorsanger; and *Congregational Activities outside of Pulpit and School*, by L. M. Franklin.

The fifth annual convention of the Federation of American Zionists was held in Boston, May 25. The strength of the federation was shown to be 174 societies. The income was \$3,214; expenses, \$1,329.

At the quinquennial convention of the order Free Sons of Israel, in Philadelphia, May 18, the number of lodges had increased to 103, all funds amounting to \$333,277. There were 11,000 members, and a reserve fund of \$935,000.

At the triennial convention of the Sons of Benjamin, in Philadelphia, July 6, the strength of the order had risen to 30,000 members, with a guarantee fund of \$137,167.

The summer session of the Jewish Chautauqua, in Atlantic City, July 6-27, was memorable for a variety of lectures and discussions on subjects like Palestine, by Rev. M. A. Meyer; *The Attitude of Non-Jewish Scholars to Jewish Literature*, by Rev. D. Kohler; *The Uses of Hebrew Manuscripts*, by Prof. S. Schechter; *Jewish Characters in English Fiction*, by Max J. Kohler; *Assyria and Egypt and the Monuments*, by Rev. C. H. Levy; *Gorky*, by Dr. E. G. Hirsch; *Shylock*, by Dr. Leon Harrison; *Modern Hebrew Literature*, by G. B. Levi. In addition there were a school of practise for teachers, popular conferences on Jewish university students and religious training after confirmation, and a course on applied philanthropy, with addresses on Social Unrest, Needy Families in their Homes, Organization in Relief Work, Dependent and Destitute Children, Preventive Work, Neighborhood Work, etc.

The second biennial Conference of Jewish Charities was held in Detroit, May 26, 25 cities being represented, about half of the membership. Among the subjects discussed were the diffusion of Jewish immigrants from the East Side of New York, the value of free loan societies, chattel-mortgage loan companies and pawn societies, delinquent children, the placing of immigrants, consumption, and the training of sociological workers. At the meeting of the American Jewish Historical Society, Jan. 30, papers were presented,

among others, on Jewish Activity in Early American Commerce, Jewish Names in the Maryland Muster Rolls, 1775-'83, Solomon Heydenfeldt, The Jews of Georgia during the American Revolution, Sampson Simson, References to Jews in the Diary of Ezra Stiles.

A resolution was introduced in the House of Representatives on April 30 by Hon. H. M. Goldfogle, of New York, asking for information from the Department of State, whether American citizens of Jewish faith holding passports issued by the American Government are excluded from Russia, and what action on the subject, if any, had been taken by any department of the United States Government. Secretary Hay's reply was that the department has no information indicating that American Jews stand upon a footing different from that occupied by Jews of other lands in the administration of Russian law, and efforts to secure uniform treatment of American citizens in Russia, begun years ago, have continued, but not with encouraging success. Far more effective was the action of the United States in reference to the Jews of Roumania, in a circular letter sent on Aug. 11 by Secretary Hay to the powers that had signed the treaty of Berlin in 1878. It referred to the violation of that treaty. As civil and religious liberty had not been enjoyed by the Jews of Roumania, in the interest of humanity it asked for more consideration and justice, and showed the cruelty and unfairness of forced emigration of any class to American shores, the only hospitable asylum left to them. Secretary Hay closed with these words: "Whether consciously and of purpose or not, these helpless people, burdened and spurned by their native land, are forced by the sovereign power of Roumania upon the charity of the United States. This Government can not be a tacit party to such an international wrong. It is constrained to protest against the treatment to which the Jews of Roumania are subjected, not alone because it has unimpeachable ground to remonstrate against the resultant injury to itself, but in the name of humanity. The United States may not authoritatively appeal to the stipulations of the treaty of Berlin, to which it was not and can not become a signatory, but it does earnestly appeal to the principles consigned therein, because they are the principles of international law and eternal justice, advocating the broad toleration which that solemn compact enjoins and standing ready to lend its moral support to the fulfilment thereof by its cosignatories, for the act of Roumania itself has effectively joined the United States to them as an interested party in this regard." While no definite action has resulted from the letter, international sympathy was aroused for the disfranchised Jews there, and the debate in the Roumanian Senate late in December on the naturalization of Jews showed the salutary influence of the American protest.

The third triennial convention of the National Council of Jewish Women was held in Baltimore

in December. It was formed in 1894, and has now 64 local sections and a membership of 7,090, with 82 study sections, in Jewish history, philanthropy, and literature; 18 mission schools; activity in kindergarten, sewing, and industrial schools; 2 day nurseries; and other helpful agencies. The receipts for the year were \$11,000, and the expenses about \$6,800. Among the addresses were Aspects of Judaism in America, by Henrietta Szold; Judaism in Small Towns, by Mrs. M. Pappe; Judaism and the Young, by Mrs. W. Miller; Federated Charities, by Max Senior; Civil Service, by Mr. Bonaparte.

There were meat riots in New York and a few other cities in May, with women as leaders, indignant at the high price of meat, which was felt keenly by the Jews in the congested districts. There was also a riot on July 30, which disturbed the funeral of Rabbi Jacob Joseph in New York, and which Mayor Low promptly investigated, censuring severely some police officials.

In January the President appointed the Hon. Oscar S. Straus a member of the Hague Court of International Arbitration, to succeed the late ex-President Harrison.

The first synagogue at Hong-Kong was dedicated on April 8, and the corner-stone of the first synagogue in Portugal since the expulsion was laid on May 25 at Lisbon.

England had its royal commission in prolonged session to investigate the evils of unrestricted immigration of aliens. A conference of Jewish women and a union of literary societies were held in London on May 13 and June 29.

At the Vienna Zionist Conference, in October, the latest results of the movement were thus summarized: First, the creation of a Jewish Statistical Bureau: The committee appointed for this purpose had organized an association in Berlin, and branches had been established in Germany and Austria. A Palestine bibliography was being prepared, and investigations were being conducted. Second, the Jewish Publication Society in Berlin: Necessary capital was provided by the section in the form of a guarantee fund to which Jewish writers and financiers contributed. It had already published a Jewish almanac and a pamphlet entitled Jewish High Schools. Third, courses on the science of Judaism, in the form of university extension lectures. Fourth, reform of religious instruction: Preparations were being made to summon a conference of teachers of religion. Fifth, art exhibitions. Sixth, Jewish high schools. For further investigations, as well as for promoting and financing the scheme for the establishment of a Jewish university, a committee had been formed in Geneva. The bureau had conducted special investigation into the conditions under which Jewish students in the various lands lived. Sums for the furtherance of this object, amounting to about 1,000,000 francs, had been guaranteed by Jewish financiers. For the whole project about 12,000,000 francs are required.

K

KANSAS. (See under UNITED STATES.)

KENTUCKY. (See under UNITED STATES.)

KOREA, Ta-Han, or Cho-Sen, an empire in eastern Asia, between China, Japan, and Russia. It is a peninsula with an estimated area of 82,000 square miles, bordering on the Yellow Sea and the Sea of Japan, with a frontier line of several hundred miles along Manchuria, and for 11 miles

on the northeast bordering on the Tumen river, which separates it from Asiatic Russia. By the Chino-Japanese War of 1894-'95 Korea became an independent state. On Oct. 14, 1897, the King assumed the title of Emperor, giving to his realm the name of Ta-Han (Great Han, meaning all Korea, in distinction from the ancient San-Han or Three Kingdoms). By the alliance between Great

Britain and Japan, entered into Feb. 11, 1902, the integrity and independence of the Korean Empire are guaranteed. The chief interests of diplomacy, trade, banking, commerce, fishing, and navigation are in the hands of the Japanese, who in 1902 numbered 30,000. Korea, on her part, agrees to raise her naval and military establishments to a footing sufficient for her own defense. In case of raising foreign loans she agrees to restrict herself to the markets of Great Britain, Japan, and the United States, and promises that no foreigners shall be appointed to places in the Korean state service, that measures shall be taken for the protection of Korean territory, and that protests shall immediately be made against any state or persons attempting to erect works or buildings calculated to injure Korea's scheme of national defense.

No exact census has yet been taken of the population, but the official report made for revenue in 1900 enumerates 5,608,351 persons. The population is variously estimated by foreigners from 8,000,000 to 15,000,000. While copper, nickel, brass, and some silver money is minted in Seoul, the regulating coinage of the country is the Japanese yen, worth 50 cents.

Government.—The present Emperor was born Aug. 28, 1841. He is assisted in government by the Council of State and 8 ministers—Royal, Household, Finance, War, Justice, Agriculture, Education, Home and Foreign Affairs. There are 14 provinces, each presided over by a governor, and 360 districts, in each of which is a magistrate with numerous assistants. An excessive number of officials keeps the country poor. Except revenue vessels, there is no navy, but an army of 7,000 men, including infantry, artillery, and cavalry, is equipped and drilled in Western style. There are 4 political parties, founded almost wholly on clan and family affiliations, with the common idea of securing as many as possible of the Government offices. Much attention and vast sums of money are devoted to graveyards, and the national revenues are lavished on royal tombs and the salaries of their keepers.

Finances.—The revenue of the empire, which in 1902 was estimated at \$7,586,530, comes chiefly from the land tax (\$4,488,235). There are taxes also on houses, mines, and the customs (\$850,000). The chief expenditures are the imperial purse (\$737,361), expenses of prefects, palace police, army, police departments, posts and telegraphs.

The currency is in a very disordered condition, native gold and silver being out of circulation, and nickel coins, many of them counterfeit, have some circulation at a heavy discount when compared with Japanese money. The Korea Society of Tokio estimates the amount of money in circulation in 1902 as follows: Copper cash, \$6,000,000; nickel, \$14,000,000; copper cents, \$890,000; brass cash, \$90,000; Japanese coins, \$1,550,000; Japanese paper, \$870,000; Korean silver dollars, \$530,000; Korean silver 20-cent pieces, \$150,000. Most of the silver money is soon withdrawn from circulation and hoarded.

Trade.—The lack of sufficient rain for more than two years, causing a famine and much distress, has also greatly hindered trade. Nevertheless, in 1901 the imports from foreign countries amounted to \$7,359,063; imports from Korean treaty ports, \$2,598,193. The exports to foreign countries were \$4,214,051; the exports at treaty ports, \$1,491,641. The import of nickel blanks for coinage was \$300,106, while gold was exported to the value of \$2,486,689.

In the Korean system of customs returns,

goods brought directly to Korea from other countries figure as imports from foreign countries, while those which are transshipped via China and Japan are entered as imports from Korean treaty ports. There is no direct commerce between the United States and Korea, so that American products, cotton, petroleum, metals, machinery, etc., do not appear separately, but are included with those from China and Japan. Most of the cotton fabrics woven in Japan are manufactured from American cotton, and the same is true of the tobacco brought from Japan, besides many other articles imported from China and Japan. In 1901 American petroleum and sundries were valued at \$312,001; mills machinery and supplies, \$249,000; electrical goods and lumber, \$236,621; or a total of \$967,622. Since Americans began mining operations in Korea, in 1896, the exports of gold have steadily increased from \$692,425 in 1896 to \$2,486,689 in 1901. The amount of gold produced in native placer mines in the province of Ping-Yang in 1901 was 44,880 ounces, on which the Government tax was \$112,000. The export of gold from the port of Wonsan in 1901 was \$1,676,245.

Communications.—The telephone system is being extended in Seoul, and from the capital to Chemulpo. The telegraphic development in the interior is about 2,500 miles of wire, in charge of 27 bureaus, employing 113 men as directors, engineers, secretaries and operators, and 303 line-men. The Morse system is in use. Electricity is generated by the use of the Leclanche batteries. Horse relays are kept at various centers to facilitate communication with distant points. Telegrams may be sent in Korean, Japanese, Chinese, or specified foreign languages. In 1899 112,450 telegrams were sent, the receipts being \$50,686; in 1900, 125,410 telegrams were sent, the receipts being \$72,443; in 1901, 152,485 telegrams were sent, the receipts being \$86,830.

The postal system, under French direction, is in a very satisfactory condition. In 1898 the Government engaged E. Clemencet, Esq., as adviser and instructor, who expanded and modernized the Korean postal service and trained assistants, till now there are, in addition to the central bureau at Seoul, 37 postal stations in full operation and 328 substations for ordinary registered correspondence. On seven main highways, with a network of postal routes, service is daily in both directions. The secondary offices are served three times a week by means of 472 foot couriers. In the center, south, and northwest of the empire each route is covered back and forth in five days. In the north and northeast eight days are required for each round trip. In 1901 1,703,000 pieces of mail-matter were carried, and the receipts were \$27,130.

The railway from the seaport of Chemulpo to Seoul, 26 miles, including a 10-span steel bridge across Han river, built and put in operation by American contractors, has reduced the time between seaport and capital from eight hours to one hour and three-quarters. There are 11 stations and 6 trains daily each way. The same American firm has built and operated an electric railway in and beyond Seoul, which is much used by the natives for daily traffic and for reaching the mausoleum of Queen Min at Keum Gok, 15 miles distant from the Great Bell in the center of Seoul. The Seoul Electric Company has the largest single electric plant in Asia. The American firm holds it under a mortgage, operating the overhead-trolley road and furnishing incandescent and arc lights for the city, the former luminaries numbering over 1,400. Two

120-kilowatt rotary converters from the Westinghouse Manufacturing Company, with boilers of the Babcock and Wilcox type, produce a direct current of 550 volts for the use of the cars, and at the same time alternating currents of 385 volts for the electric lighting. The consulting engineer is a Japanese, a graduate of the Massachusetts Institute of Technology. The official opening of the section from Seoul to Sangdo (the ancient capital) of the Seoul-Wiju Railway (under the auspices of the Korean Government, with French engineers, etc.) took place on May 4, 1902, with ceremonies and speeches by Cabinet officers in the presence of 200 persons. But it has since been temporarily abandoned for want of Korean funds. The railway from Fusan to Seoul, under Japanese direction, is steadily proceeding, with a great army of workmen, and is to have 40 stations. The first section, 1 mile, from Fusan to Chongyang, was opened to travel early in October, 1902.

Politics and Events.—The year is noted for a lack of rain and a general famine that has caused great suffering and loss of life, together with the desertion of whole districts of country by the hungry people, accompanied by outbreaks of anarchy and robbery. Considerable Government help was required for the people, there being 20,000 needy persons in Seoul, where last winter 90 persons were frozen to death. On Aug. 1 the prisons in Seoul were full to overflowing, and there were 40 executions that day.

The ginseng-crop for 1901, amounting to 68,120 pounds, was sold to a Japanese firm for \$625,239. The supply being in excess of the demand, the purchasers at once burned 13,100 pounds. The market is limited, the Chinese being almost the only consumers. It is asserted that only that raised upon the imperial farms at Sangdo have real medicinal virtues. Here the soil is a disintegrated granite, and the farms are guarded with great care, but the annual crop has been steadily growing larger. The normal annual quantity is 19,650 pounds. In some years \$8 a pound is paid for Sangdo ginseng, but always a very much lower price for other grades of the root.

On June 11 the Japanese steamers Kuma-gawa Maru and Kiso-gawa Maru, belonging to the Osaka Navigation Company, came into collision 85 miles south of Chemulpo, and the former was

sunk, the loss of life being 17 Koreans, 6 Japanese, and 1 American—the Rev. H. G. Appenzeller, for many years a most valuable missionary and teacher in Korea. The coasts of Korea are not yet furnished with lighthouses, but the Government program calls for 30 lighthouses and a lighthouse steam tender, at a cost of 1,000,000 yen. The first private-owned Korean steam-vessel entered Chinnempo this year.

A monument to the Japanese killed in the Chino-Japanese War of 1894-'95 was erected on the great mountain of Nansen, near Seoul.

A vein of fine anthracite coal was opened in the summer of 1902 at Muan, in Chulla province.

In a great storm, Sept. 24, 115 lives were lost and 4,012 houses destroyed.

A revival of Buddhism is noted in the dedication of a great monastery outside the East Gate of Seoul, in which 800 Buddhist monks took part, and in charge of which 50 soldier monks are to be permanently kept.

About 100 Korean students are pursuing their studies in Japan and 40 in the United States.

The custom of saluting by discharges of cannon on royal birthdays and other national holidays was introduced on Sept. 18, in honor of the fortieth anniversary of the Emperor's accession to the throne. The Emperor made donations in aid of the sufferers from cholera, on account of the prevalence of which disease in Seoul the national celebration was postponed until March, 1903.

A memorial intended to commemorate the brilliant events of the present Emperor's reign was begun in April, and will be set up in the capital.

A new monument to Kija, the founder of Korean civilization, already begun, is to be erected in Ping-Yang. On the site of Kija's ancient home a new palace to be built by the Emperor is to occupy a site 1,200 by 800 feet in area.

Equalization of weights and measures throughout the empire, in accordance with imperial decree, is being carried out.

The raids of Chinese bandits on the northwestern frontier were numerous in 1902, but most of them were successfully driven back by the native soldiery armed with modern rifles.

A great fire at Fusan, early in November, made 1,400 people homeless.

L

LIBRARIES, PUBLIC. Statistics for 1901-'02 relating to public libraries owned and controlled by municipalities are given in Bulletin No. 42 of the United States Department of Labor (September, 1902), covering cities having a population of 30,000 or over—137 in all. The accompanying table gives figures for the principal cities, and indicates the nature of the information.

Gifts.—The record of gifts and bequests to American and English libraries, July 1, 1901, to June 1, 1902 (single gifts of \$500 or 250 volumes and over), covers 721 gifts, representing a money value of \$11,974,298.54. Of this amount, \$7,604,000 were contributed by Andrew Carnegie to 234 libraries, including \$6,359,000 given to 214 libraries in the United States. Mr. Carnegie, during about a decade, made gifts to 368 cities and towns for public libraries.

Commissions.—Four new library commissions are to be noted, those for Nebraska, Washington, Idaho, and Delaware.

CITIES.	Number of municipal libraries.	VOLUMES.			
		Number.	Number added during the year.	WITHDRAWN.	
				For home use.	For use in reading-rooms.
New York ...	14	1,447,048	127,926	4,750,698	1,448,751
Chicago.....	1	821,081	14,480	1,772,741	600,000
Philadelphia..	1	239,188	4,962	1,915,687	Not reported.
St. Louis.....	1	170,855	20,855	778,507	208,757
Boston.....	1	812,264	30,887	1,483,513	406,598
Baltimore.....	1	211,449	7,751	635,081	130,753
Cleveland.....	1	171,592	1,469	809,515	Not reported.

Legislation.—During 1901 106 laws were passed in 31 States and Oklahoma Territory. "Much of this legislation aims at the extension of the use of existing libraries, cooperation between municipalities, and the formation of new libraries in small towns, schools, and rural dis-

tricts. Cities and library boards are given greater freedom of action in the establishment and management of libraries; special appropriations are larger, and in six States the maximum tax limit has been raised."

Increase of Books.—President C. W. Eliot, of Harvard University, advocates storing the mass of unused books in a depository away from, and on cheaper ground than the main library, so that shelves and catalogue in the latter may not be clogged by a mass of dead matter. This depository could be a storehouse for the disused books of all the libraries in a certain defined district, and the books would be "reasonably accessible to real students." While the Harvard Committee reported that the policy of discarding books from the library in any large numbers is inadmissible, yet the problem of want of shelf-room, in face of the increasing rate at which large collections are growing, certainly becomes more perplexing and seems to call for "some new policy concerning the storage of these immense masses of printed matter." This recalls the processes of sifting or weeding advocated by C. F. Adams (1893) and others. Correlated principles referred to are that of forwarding to the library which makes dead subjects a specialty books which accumulate on those subjects, and that of the exchange of duplicates, the latter bringing up the oft-discussed scheme of a general "clearing-house." At all events, a scheme like Prof. Eliot's increases the dependence on interlibrary loans.

Methods of cooperation between the great reference libraries as to purchases, by agreement as to which specialties shall be cultivated by each library, help also to avoid unnecessary duplication of certain large groups of books.

In connection with this question, Dr. Billings, in his address as president of the American Library Association, said: "I think it well, however, to remind you of your duties to this your national library, and especially that the librarian of every city, town, or village in the country should make it his or her business to see that one copy of every local, non-copyrighted imprint, including all municipal reports and documents, all reports of local institutions, and all addresses, accounts of ceremonies, etc., which are not copyrighted and do not come into the book trade, is promptly sent to our national library."

New Buildings.—Among the larger library buildings completed during the year are the following: St. Joseph, Mo., Free Public Library (\$96,500 for building, \$11,000 for site); Trenton, N. J., Free Public Library (\$115,000); Cheyenne, Wyo., Carnegie Public Library (\$50,000); first Carnegie library building in New York city—Yorkville Branch of New York Public Library.

Fiction.—The large proportion of works of fiction drawn by readers is always a fruitful subject for discussion. Herbert Putnam, of the Congressional Library, makes the radical suggestion that no work of fiction be purchased by libraries until a year after its publication. Certainly the public library can not satisfy the demand for an immediate supply of a new novel to all who desire it; some must wait, and wait long. The question of indexing fiction by subjects has also been brought up again, and in one library, at least, they have classified fiction on special subjects (as history) with the subject on the shelves.

Bibliography. Cataloguing.—An important event was the transfer of the issue of printed catalogue cards from the Publishing Board of the American Library Association to the Congressional Library. The former body issued in 1902,

as a result of cooperative effort, the carefully annotated *Literature of American History: A Bibliographical Guide*, edited by J. N. Larned, which exemplifies in a striking manner the principles of the "evaluation of literature" advocated by Mr. George Iles. The work of the board has been greatly aided by the gift of \$100,000 from Andrew Carnegie, the announcement of which gift by President John S. Billings formed a memorable event in this year's convention of the American Library Association. It is "a donation for the preparation and publication of reading lists, indexes, and other bibliographical and literary aids."

The issue of index cards for periodicals not covered by Poole's Index is going on, and cards have also been printed for miscellaneous sets, such as the British Parliamentary Papers, the Massachusetts public documents, the National Museum Bulletin, Smithsonian publications, United States Bureau of Education Circulars, and Massachusetts Historical Society Collections.

Traveling Libraries.—In New York State, which has 1,000 traveling libraries, pictures are now sent out as well as books, as also apparatus, scientific collections, and maps; even traveling libraries for the blind have been started. It appears that in many of the States the development of the traveling-library idea is largely due to women's clubs. In the lumber regions of Canada, traveling libraries not seeming expedient, permanent reading-camps are being established, and appear to have good results.

Home Libraries and Reading Clubs.—"Statistics show that the majority of a large city's population will not come to the library." The work of the "home libraries," referred to here in 1900, is extending. Boston is reported to have 60 of them, Baltimore 30, Chicago 30, Philadelphia 4, the New York Public Library 25, Cincinnati 15, Helena 2, and Pittsburg 31. They are usually managed by charitable institutions and libraries, either separately or in conjunction. In the Congressional Library readings for the blind have been begun, T. N. Page and F. H. Smith being among the readers.

Associations.—The New York Library Club has issued a manual which gives information concerning 298 libraries, with branches, 350 in all, and serves as a useful guide to the collections on important special subjects which may be found in the various libraries of the metropolis.

France.—The French Ministry of Public Instruction passed an order on Dec. 24, 1901, permitting and regulating interlibrary loans, the National, Ste.-Genevieve, Mazarin, and Arsenal Libraries, Library of the Institute, and university libraries being authorized to lend duplicates to each other.

Germany.—Adalbert Roquette's pamphlet on *Die Finanzlage der deutschen Bibliotheken* (1902) calls attention to the insufficient means at the disposal of German university libraries. Not only have but few annual endowments been increased, but the large increase in the number of books published as well as augmented prices have served further to reduce the proportion of necessary books which the libraries are able to buy. Impaired usefulness is the natural result. Besides the obvious need of larger appropriations, a well-developed system of interlibrary loans, with a few large libraries as bases of supply, is suggested.

Dr. Chr. G. Hottinger opened a library school for women in Berlin in 1900, with the purpose of opening a wider field for women's work rather than to develop the public-library idea.

Denmark.—Traveling libraries are being fitted out by the Government. These go to small libraries, and from them to the surrounding villages.

Russia.—Theodor Pavlenko, a publisher of Vladivostok, Siberia, has given 100,000 rubles to open public libraries.

Australia.—New libraries are organized with the usual Government aid under the municipalities act. Books for these libraries are furnished up to the limit of £200 by the Government.

Asia.—In April, 1901, was issued Vol. I, No. 1, of the Toheki, official organ of the Kansai Bunko Kyokai or Western Library Association (of Japan), with an interesting table of contents.

A public library of Chinese books was founded at Shanghai by Mr. Loo in 1901.

LOUISIANA. (See under UNITED STATES.)

LOUISIANA-PURCHASE EXPOSITION.

In 1889 the St. Louis Republic of May 12, in discussing centennial celebrations of great events in the history of the United States, said: "In the United States of 1903 all the present Territories of the Purchase will be States, and they will be represented with the whole union here in St. Louis at this centennial of the birth of the nation begotten by Jefferson when he wrote the Declaration of Independence. If 1776 declared our independence of the world, 1803 achieved it, and the States of the Louisiana Purchase should join in making this Western centennial the greatest of all." Discussion continued in various journals, until on June 7, 1896, David R. Francis, at the annual meeting of the Business Men's League, said: "St. Louis is the gateway of that great territory [Louisiana Purchase], and she should celebrate its centennial in 1901 by a great international exposition, second to none ever held in the world." The agitation thus begun continued, and on Feb. 5, 1898, a bill was introduced in Congress providing for the holding of an international exposition in St. Louis in 1903, in commemoration of the Louisiana Purchase. A meeting of the Missouri Historical Society in September resulted in the appointment of a Committee of Fifty, who arranged with the Governor of Missouri for a convention to which the governors of all the States and Territories in the Louisiana Territory were invited to send delegates. This convention met on Jan. 10, 1899, in St. Louis, and 14 Louisiana-Purchase States and Territories were represented. Resolutions were adopted favoring an international exposition to be held in St. Louis in 1903 to commemorate the centennial of the Louisiana Purchase. An Executive Committee, with David R. Francis as its chairman to take charge of the plans, was authorized, and it was decided to invite the United States Government to participate in the exposition and financially assist in promoting it. The Executive Committee determined upon a plan for raising \$5,000,000 by popular subscription, and asking \$5,000,000 from St. Louis and \$5,000,000 more from the United States. The Executive Committee, with increased membership, was then reorganized with Pierre Chouteau as chairman of the General Committee; David R. Francis chairman of the Executive Committee, and committees as follows: Finance, Legal, and Legislative, of which W. H. Thompson, James L. Blair, and F. W. Lehmann were respectively chairman. A bill providing an appropriation of \$5,000,000 by Congress for the exposition was framed, and it was introduced in the House by Representative Joy, of St. Louis, and in the Senate by Senator Cockrell. In April an act to incorporate the Exposition Company became a law. A mass-meeting of citizens of St. Louis, held on April 22,

elicited subscription pledges to the amount of \$4,244,670, and thereafter much activity was displayed in securing additional subscriptions until \$10,000,000 were procured, of which \$1,000,000 came from the State and \$5,000,000 from the municipality of St. Louis. This had its effect upon Congress, and the sundry civil bill passed on June 4, 1900, containing an amendment promising support and \$5,000,000 conditional on \$10,000,000 being raised by St. Louis. On Feb. 9, 1901, the Louisiana-Purchase Exposition bill passed the lower house of Congress, and on March 3 the Senate took favorable action, and the bill was at once signed by the President. A National Commission consisting of Thomas H. Carter, Montana, President; Martin H. Glynn, New York, Vice-President; John M. Thurston, Nebraska; William Lindsay, Kentucky; George W. McBride, Oregon; Frederick A. Betts, Connecticut; John M. Allen, Mississippi; John F. Miller, Indiana; Philip D. Scott, Arkansas; and Joseph Flory, Secretary, was appointed by President McKinley on March 12. The Louisiana-Purchase Exposition Company was incorporated with an authorized capital of \$6,000,000, and at its first meeting, held on May 2, the following officers were elected: President, David R. Francis; First Vice-President, Corwin H. Spencer; Second Vice-President, Samuel M. Kennard; Third Vice-President, Daniel M. Honser; Fourth Vice-President, Cyrus P. Walbridge; Fifth Vice-President, Seth W. Codd; Sixth Vice-President, Charles H. Huttig; Seventh Vice-President, August Gehner; Eighth Vice-President, Pierre Chouteau; Treasurer, William H. Thompson; and Secretary, Walter B. Stevens. Also, the following committees were appointed: Executive, Press and Publicity, Ways and Means, Transportation, Finance, Grounds and Buildings, Concessions, Insurance, and Foreign Relations. The selection of a site was immediately considered, and the municipal authorities authorized the use of the city parks. Seven proposed localities were inspected, and on June 25, 1901, the directors unanimously approved the Executive Committee's selection of Forest Park, and announced the decision, which was approved by the National Commission two days later. The announcement of the following Commission of Architects and Committee on Grounds was then made: Isaac S. Taylor, Chairman and Director of Works; Widman, Walsh, and Boisselier, St. Louis; Barnett, Haynes, and Barnett, St. Louis; Eames and Young, St. Louis; Van Brunt and Howe, Kansas City; Carrere and Hastings, New York; Cass Gilbert, New York; Walker and Kimball, Omaha and Boston; Theodore C. Link, St. Louis. With equal promptness chiefs of the different divisions were appointed as follow: Director, Frederick J. V. Skiff; Education, Howard J. Rogers; Art, Halsey C. Ives; Liberal Arts, John A. Ockerson; Manufacture, Milan H. Hulbert; Machinery, Thomas M. Moore; Electricity, W. E. Goldsborough; Agriculture and Acting Chief of Horticulture, Frederick W. Taylor; Fish and Game, Tarleton H. Bean; Mines and Metallurgy, Chief, J. A. Holmes; Honorary Chief, David T. Day; Transportation, W. A. Smith; Social Economy, Howard J. Rogers.

A Division of Exploitation was organized, and commissioners were sent to foreign countries for the purpose of creating an interest in the exposition and securing exhibits. This commission consists of Thomas W. Cridler, Europe; John Barrett, Oriental Countries; Vittorio Zeggio, Italy; José de Olivares, Argentina, Bolivia, Chile, Paraguay, Uruguay; John Taylor Lewis, Brazil; Ernest H. Wands, Colombia, Ecuador, Peru, and

Venezuela; Charles M. Pepper, Cuba; John Rice Chandler, Costa Rica, Guatemala, Honduras, Nicaragua, and Salvador; F. H. Wennerstrum, Denmark, Norway and Sweden. Resident representatives: Joseph H. Brucker, Berlin; Palmer L. Bowen, Paris; and George F. Parker, London.

The site chosen for the exposition is a well-timbered tract of about 1,300 acres inside the city boundaries, half of which will be occupied by the exhibition. The remainder of the land necessary lies just across a well-known country road, and will be connected with the main body by every device common or necessary in such cases. Within this area are the grounds of Washington University, comprising about 110 acres, which, with the use of the college buildings, only recently completed, were leased to the Exposition Company. In consideration of this privilege, the company will erect buildings to be left upon the ground for the increase of university accommodations. The main group of exhibit buildings will be 15, 11 of which are arranged in the form of a fan, the Art Palace forming the apex at the southwest. The construction of the buildings was promptly undertaken, and on Sept. 3, 1901, the first stake on the world's fair site was driven, with appropriate ceremonies.

The larger buildings include the Art Palace, which will consist of 3 fire-proof pavilions, the central 1 to be permanent. The dimensions of the united structure will be 450 by 830 feet, and the estimated cost is \$1,000,000. In the central structure will be a large International Sculpture Court. Where certain works of sculpture can be shown to better advantage in the open, space will be provided for them in the spaces adjacent to the Art Buildings. There will be spacious, well-lighted galleries for paintings, and specially adapted galleries will be provided for the installation of models of buildings, sculptures and decorations, mural paintings, wood-carvings, and various objects of applied art. Provision will be made for the installation of certain works in stained glass, carving, mosaic, etc., as portions of the Art Buildings.

The building devoted to Education and Social Economy is to be 400 feet wide and 600 feet long, and will cost \$350,000. In this building an effort will be made to bring together, for comparative investigation, the educational systems of every country in the civilized world that is noted for educational progress. In social economy the exhibits will present from each country a complete survey of its natural resources, its industrial organization, and its social problems or efforts for improvement of existing conditions. The scheme includes the study and investigation of official and private bureaus and offices, museums, boards of trade, economic and social-reform associations, congresses, and literature relating to this and all scholastic instructions in business and social economy.

The Electricity Building will be in the Corinthian style of architecture, and is to be 600 feet long by 525 wide, and will cost \$400,000. In the schedule all kinds of apparatus for generating and using electricity are included, and the development of the application of electricity to chemistry will be elaborately shown.

The indoor exhibits of Forestry and the Department of Fish and Game are to be housed in a single building with a frontage of 400 feet and a depth of 600 feet, costing \$350,000. Forestry, its development and methods, together with the products of foreign industries, including appliances for gathering wild crops or products of the

soil, without culture, will be shown in this structure.

The Palace of Liberal Arts, in the classic French Renaissance style, will be 525 feet wide and 750 feet long, and will cost about \$500,000. The subjects in this department include exhibits pertaining to printing and appliances; photography and kindred sciences; books, publications, and bookbinding; printed music; map and map-making; scientific apparatus; the theater and its equipment; science of chemistry; paper and its manufacture; civil and military engineering; sea warnings; gas, water, and sanitation, and the building of tenements.

The Machinery Building is to be 525 feet wide and 1,000 feet long, and is to cost \$496,597. It will contain the power plant for the exposition, developing 10,000 horse-power and transferring 10,000 additional horse-power. The display will show motive power; transmission; machinery for making machinery; machines and systems for preventing and fighting fire; weighing machines; hydraulic machinery; tools and apparatus, and equipment illustrating the economics of machine-shop and factory practise. A boiler-house is to be built a few rods west of Machinery Building.

The Manufactures Building will have a width of 525 feet and a length of 1,200 feet, and will cover approximately 14 acres. It fronts on the main avenue and in the center has a grand court, while over the entrance is a square tower 400 feet high. Colonnades, courts, and loggias are salient features of the architecture. The classification of the exhibits is very extensive and will include representations from nearly all the industrial arts and crafts.

The building devoted to mines and metallurgy will be in the Corinthian style of architecture, with façades of open columns and inner courts. The estimated cost is \$5,000. In this building will be shown all kinds of equipment for use in the working of mines, ore beds, or stone-quarries, including tools, instruments, explosives, lighting apparatus, safety appliances, methods for handling products and for their above-surface transportation, machinery for working purposes, apparatus for washing, devices for milling, equipment for the handling of solutions, mechanical appliances for shaping marble, granite, slate, and all building-stones, equipment for the handling of clays, and apparatus for compressing fuel.

The Textile Building will be 525 feet wide and 750 feet long, with a central court. Its estimated cost is \$320,000. The exhibits form part of those included under the general head of manufacture, although restricted to the special products indicated by the title.

The Transportation Building will cover 15 acres and will be 525 feet wide by 1,300 feet long, and will cost \$700,000. The design of the building will indicate its purposes, the great arches at the ends and to the middle of the long façades simulating entrances for railway-trains. The floor plan provides 4 miles of tracks for railway displays, and ample space for marine transportation exhibits and displays of automobiles and road and farm vehicles of all kinds. Under the heading of transportation is included aerial navigation, which is to be made a prominent feature of the exposition.

The Varied Industries Building will be 525 feet wide by 1,200 feet long, with a central court. It is adjacent to the Manufactures Building, and like it has a tower 400 feet high. Its estimated cost is \$406,000. The exhibits are broadly included under those designated as manufactures. In front of the Liberal Arts, Manufactures, and

Textile buildings is a natural amphitheater sloping to what will be a great basin. Down the slopes of the hill above the cascades will be a long curved architectural screen, with a beautiful Festival Hall in the center and restaurant pavilions at the ends. Sculpture emblematic of 14 States and Territories will constitute an important decorative feature of the screen.

Of the other larger buildings, the Government Building will be on the plateau, east of the Art Palaces, and will be 175 feet wide by 800 feet long. Its estimated cost is \$450,000. The exhibits shown in it are under the supervision of a Government board, organized as follows: J. H. Bingham, Department of Agriculture, chairman; William H. Michael, Department of State; Walter C. Hills, Treasury Department; J. B. Brownlow, Post-Office Department; Frank Strong, Department of Police; Edward M. Dawson, Department of the Interior; B. F. Peters, Navy Department; John C. Schofield, War Department; G. W. Hanger, Bureau of Labor Statistics; W. de C. Ravenel, United States Fish Commissioner; Williams C. Fox, Bureau of American Republics; W. V. Cox, Secretary; W. M. Geddes, Disbursing Officer.

Immediately adjacent to this building will be the pavilion of the United States Fish Commission.

The office of administration will be housed in the building of the Washington University, which has been leased for that purpose. It is of Missouri pink granite and Bedford (Indiana) sandstone, and will cost \$740,000.

In the extreme southwest corner of the grounds will be the department devoted to Physical Culture, which will include a gymnasium 182 feet long and 94 feet wide, to cost \$150,000. The athletic field will be 750 feet long and contain one of the finest tracks in the world.

Among the other buildings of which information is available are: Hawaiian Building, in the form of a cross, being 90 feet each way on the axial lines; Missouri Building, to be a permanent fire-proof structure, to cost \$300,000 and to be used as a museum after the exposition; Press Building, a modest but commodious structure that was dedicated on Oct. 25, 1902; Temple of Fraternity, an adaptation of the Parthenon in Athens, to cost \$200,000, paid for with funds raised by the fraternal orders. The Burns Cottage Association will produce a replica of Burns's Ayrshire cottage and Stirling Castle. Acting under the authority of Congress, the United States Government Commission has appointed a board of 21 woman managers, as follows: Miss Helen M. Gould, New York city, President; Mrs. James L. Blair, St. Louis, Mo., Vice-President; Mrs. Louise E. Frost, Winona, Minn.; Mrs. John A. McCall, New York city; Mrs. John M. Holcombe, Hartford, Conn.; Miss Anna L. Dawes, Pittsfield, Mass.; Mrs. Fannie L. Porter, Atlanta, Ga.; Mrs. Frederick Hanger, Little Rock, Ark.; Mrs. W. E. Andrews, Hastings, Neb.; Mrs. Helen Boice Hunsicker, Philadelphia, Pa.; Mrs. Emily W. Roebing, Trenton, N. J.; Mrs. Jennie Gilmore Knott, Louisville, Ky.; Mrs. Belle Everest, Atchison, Kan.; Mrs. William H. Coleman, Indianapolis, Ind.; Mrs. M. H. DeYoung, San Francisco, Cal.; Mrs. Margaret P. Daly, Anaconda, Mont.; Mrs. Finis P. Ernest, Denver, Col.; Mrs. Edward L. Buchwalter, Springfield, Ohio; Mrs. Mary Phelps Montgomery, Portland, Ore.

Thirty-eight States and Territories have appointed or authorized world's fair commissions, committees, or bureaus. These are: Alabama, Arizona, Arkansas, Colorado, Connecticut, Flor-

ida, Georgia, Hawaii, Idaho, Illinois, Indian Territory, Iowa, Kansas, Louisiana, Kentucky, Maine, Maryland, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New Mexico, New York, North Dakota, Ohio, Oklahoma, Philippine Islands, Porto Rico, South Carolina, Texas, Virginia, Washington, West Virginia, Wisconsin, and Wyoming. Also the following States have made appropriations of the amounts donated herewith: Arizona, \$30,000; California, \$300,000; Colorado, \$100,000; Delaware, \$10,000; Idaho, \$20,000; Illinois, \$800,000; Indiana, \$75,000; Iowa, \$50,000; Maine, \$40,000; Massachusetts, \$75,000; Michigan, \$100,000; Minnesota, \$50,000; Missouri, \$150,000; Montana, \$50,000; Nebraska, \$50,000; New Hampshire, \$25,000; New Jersey, \$20,000; New Mexico, \$25,000; North Carolina, \$25,000; North Dakota, \$25,000; Ohio, \$100,000; Pennsylvania, \$300,000; Rhode Island, \$25,000; Vermont, \$15,000; Washington, \$100,000; West Virginia, \$40,000; Wisconsin, \$65,000; Wyoming, \$30,000; total, \$2,695,000.

There will be, in connection with the exposition, a gathering of congresses, and it is expected that there will be meetings of the different trade-unions. Efforts will be made to procure the meetings of the national conventions and associate conventions for the nominations of candidates for President and Vice-President.

Although nearly all the larger buildings are either completed or nearly so, it was found early in 1902 that the time was too short to prepare properly for a world's fair, and it was therefore decided to have a formal dedication of the grounds and buildings with appropriate ceremonies on April 30, 1903, and to open the exposition a year later, April 30, 1904.

The usual amount of attractive advertising material has been distributed by the Exposition Company, and the World's Fair Bulletin, the first issue of which appeared in November, 1899, is published monthly in the interest of the Louisiana-Purchase Exposition.

LUTHERANS. The statistics of the Lutheran Church in the United States and Canada, gathered and collated for the Lutheran Church Almanac, show a steady progress in every department of church work. The Lutheran Church is one in faith, though, on account of its polity, due very largely to diversity in languages used, it is divided into general and district organizations or synods. The Church, as thus organized, embraces 62 district synods, classified under 4 general bodies and 15 independent synods, all together having 7,090 ministers, 11,678 congregations, and 1,723,819 communicants. It has 4,478 parochial schools, with 3,170 teachers and 184,902 pupils, and 6,104 Sunday-schools, with 57,246 officers and teachers and 525,467 pupils. The benevolent contributions, exclusive of congregational and local expenses, amount to \$1,252,466.26. The statistics of the several bodies are as follow:

BODIES.	Ministers.	Congregations.	Members.	Benevolence.
General Council.....	1,308	2,106	361,048	\$290,390.68
General Synod.....	1,281	1,578	202,531	270,546.95

The educational institutions of the Church number 116, of which 23 are theological seminaries, with 905 students, 50 colleges with 8,833 stu-

dents, 32 academies with 2,962 students, and 11 colleges for women with 1,065 students. These institutions have property valued at \$5,971,642 and endowment amounting to \$1,724,809, with 342,610 volumes in their libraries, employing 898 professors and instructors, who have under their instruction 13,765 students, of whom 2,612 have the ministry in view. Here, again, language differences supply the reason for the multiplicity of institutions, for the list includes English, German, Swedish, Norwegian, Danish, and Finnish colleges and seminaries.

The charitable institutions of the Church number 99, of which 43 are orphanages, 18 homes for the aged and needy, 19 hospitals, 11 immigrant and seamen's missions, and 8 are deaconess institutions. These have property valued at \$4,113,827, and endowment amounting to \$252,655, and care for 23,709 inmates.

The total money value of the property and endowment of the 215 educational and charitable institutions is \$12,062,933. The endowment is an insignificant sum, amounting to not quite \$2,000,000, and comparatively few have any endowment at all.

The General Council embraces 10 synods, 1,303 ministers, 361,048 communicant members. The membership of this general body consists of English, English-German, German, and Swedish congregations, with a small number of Finns and Slavonians. No convention of the general body was held in 1902, but the various mission, benevolent, and educational operations were carried on by boards or committees. The home missionary operations carried on by the General Board and the boards of the district synods received careful attention and number more than 600, with a membership of more than 30,000. The missions in Porto Rico and in East India have received special attention, the former receiving two additional missionaries and the latter 7. This more than doubles the missionary force in India, counting only those that have been sent from America, the entire force of workers being 160. Progress has been made in the erection of new buildings, increasing the teaching force, and adding new courses and new departments in the various institutions.

The General Synod, the oldest general body in America, embraces 24 district synods, mostly English, 1,231 ministers, 1,578 congregations, and 202,531 members. No convention of this body was held in 1902, but its various operations were carried on by boards charged with specific duties. Its home missionary operations are extensive and widely scattered in many of the States, and its mission in India is in a flourishing condition, with a college having more than 700 students.

The Synodical Conference.—This general body, organized in 1872 and embracing 3 district synods, 2,129 ministers, 2,772 congregations, and 599,951 members, almost exclusively German, held its nineteenth biennial convention in St. John's German Church, Milwaukee, Wis., beginning July 23, 1902. Seventy delegates were present, representing the Synod of Missouri, Ohio, and other States; the General Synod of Wisconsin, Minnesota, and Michigan; and the English Synod of Missouri and other States. The following officers were elected: The Rev. John Bading, Milwaukee, Wis., president; the Rev. Philip Brand, Pittsburg, Pa., vice-president; the Rev. Prof. John Schaller, New Ulm, Minn., secretary; Prof. A. Ackermann, New Ulm, Minn., assistant secretary; and Mr. H. A. Christiansen, Detroit, Mich., treasurer. The Norwegian Synod, numbering 340 ministers, 850 congregations, and 76,370

members, though not a member of this general body, was represented by delegates who were warmly welcomed by the president. In response, the Rev. O. P. Vangness, of Story City, Iowa, emphasized the unity of spirit and friendly relations existing between his synod and the synodical conference. As the Norwegian Synod expects to celebrate the fiftieth anniversary of its organization in 1903, a committee, representing the synods in connection with the general body then in session, was elected to attend the anniversary convention. The request of the English Synod that the general body should cooperate in their work of carrying on English missions met with favorable action to the extent that those synods that have not yet created a fund for English missions were advised to do so. The necessity of prosecuting the English work was emphasized by various speakers. The request for a standard text of Luther's Small Catechism and explanation was referred to a committee with instructions to report at the next convention. The committee was also instructed to report on the question of liturgical uniformity in English congregations within the bounds of the general body, including the congregations connected with the Norwegian Synod, which body is to be represented in this work. The committee appointed at a former convention to revise the translation of Luther's Small Catechism, reported additional changes in the proof-text already issued. It was resolved to publish the amended text with editorial notes on the changes suggested, and to take final action at the next convention of the conference. The doctrinal treatise prepared by Prof. E. A. W. Krauss, director of the seminary at Addison, Ill., on the subject of alleged contradictions in the Bible was carefully and thoroughly discussed. A full report of the missionary operations among the negroes of the South was presented and ample time was given to its consideration, much interest being manifested in this difficult, but growing work. The receipts from all sources during the past two years amounted to \$36,085.97. Additional workers are to be placed in the field, and one, or perhaps two, preparatory schools for negro students are to be established. This body also carries on missionary operations in East India and in Brazil and other South American countries, but reports of these operations are not accessible. The next convention will be held in Winona, Minn., in 1904.

The United Synod, South.—This general body, organized in 1886 and consisting of 215 ministers, 433 congregations, and 41,795 members, almost exclusively English, held its eighth biennial convention in St. John's English Church, Charleston, S. C., beginning May 7, 1902. When the convention was formally opened, the president presented his report, in which he gave an account of work done, and presented a wide field of pressing work to be done in home and foreign missions, education, work among the orphans, and other benevolent operations. The following officers were elected: The Rev. Robert A. Yoder, D. D., Newton, N. C., president; the Rev. Andrew G. Voigt, D. D., Wilmington, N. C., vice-president; the Rev. Samuel T. Hollman, D. D., Newberry, S. C., secretary, and Charles Duls, Esq., Charlotte, N. C., treasurer.

The mission in Japan is in a prosperous condition, having several native pastors on the ground. Addresses were delivered, urging an earnest prosecution of the work. Home missionary operations occupied the earnest attention of the convention. The cry comes from the West

and Southwest for missionaries, in order that congregations may be organized among the scattered Lutherans. A plan was referred to the Board of Missions to place a traveling missionary in Mississippi. The general body signified its willingness and readiness to cooperate with the Northern bodies in the effort to develop the immense territory bordering on the Gulf, into which thousands of Lutherans are pouring from all sections of the country. The most encouraging feature of the convention was the announcement of the success in the effort to raise \$30,000 toward the endowment of the theological seminary at Mount Pleasant, S. C., thus enabling the institution to secure the service of an additional professor. The Sunday-school question received careful attention, and the work was referred to a permanent committee. One of the unique features of the convention was the attendance of a group of Eskimo Lutherans who superintended an exhibit at the Charleston Exposition. The next convention of this body will be held in Newmarket, Va., in 1904.

The Norwegians in the United States are organized into 4 separate and independent synods, numbering altogether 921 ministers, 2,701 congregations, and 277,826 members. Of these, the United Norwegian Church is the most active and progressive. The thirteenth annual convention of this synod was held in Minneapolis, Minn., June 18-26, 1902. The convention was attended by more than 700 clerical and lay delegates. The recent death of the Rev. Gjermund Hoyme, president of the United Church, whose familiar figure had been so prominent at every previous meeting, caused a spirit of deep sadness to pervade the gathering. The following officers were elected: The Rev. T. H. Dahl, Stoughton, Wis., president; the Rev. Nils J. Ellestad, Norway, Minn., vice-president; the Rev. Jens C. Roseland, Austin, Minn., secretary; and Hon. Lars Swenson, Minneapolis, Minn., treasurer. President Dahl, who was acting president during the Rev. Mr. Hoyme's sickness, presented a very interesting and encouraging report, especially of the English work. He called attention to the fact that those ministers who are without parishes would more readily receive calls if they could use the English language. He emphasized the necessity for more English-speaking graduates from the theological seminary, and recommended the election of an additional English Professor of Theology. He declared that the English question has become one of life or death among the Norwegians in America. This convention of the United Church marked the culmination of a great and successful effort to erect buildings for its theological seminary at St. Paul, Minn., and for its college at Northfield, Minn. During the two years preceding this convention the United Church collected and paid \$176,311.26 for these two institutions. On June 15, 1901, the large new college building at Northfield was dedicated, and on June 22, 1902, the new building for the theological seminary was dedicated free of debt. It is in St. Anthony Park, St. Paul, and cost more than \$80,000. The building has accommodations for 100 students, with lecture-rooms, chapel, fire-proof library, hospital rooms, dining-room, and kitchen. The building with its site of 9 wooded acres is worth \$100,000. The individual contributions toward this object were in many instances exceedingly small, but they came from all parts of the territory of the synod. A beautiful library building was erected at Northfield at an expense of \$13,000, the gift of Mr. Halle Steensland, Norwegian-Swedish consul at Madison, Wis., and

chairman of the United Church Board of Trustees. The synod also took steps at this convention toward the erection of a chapel at the college at Northfield as a memorial to the late president Hoyme, which is to cost \$20,000. Steps were also taken toward gaining control of all the academies now connected with the synod, and arranging their courses of study with reference to the synodical college at Northfield.

Icelanders.—The Icelandic Evangelical Lutheran Synod of North America held its eighteenth annual convention in the Icelandic Lutheran Church at Gardar, N. Dak., June 21-26, 1902. Gardar is a small settlement 7 miles north of Edinburg, and is thus described by the Rev. Alfred Bergin, representative of the General Council to this convention: "The settlement consists of people who call Iceland their native home. In the township of Gardar nearly every one hails from the little island in the Arctic Ocean. Every one belongs to the Lutheran Church of Gardar, of which the Rev. Frederick J. Bergman is pastor. Two stores, several residences, a town hall, a schoolhouse, and near it a beautiful church, make the center of this Icelandic settlement. The country round is very beautiful, lying among the groves and along the bubbling brooks on the slopes of the so-called Pembina mountains, among which the thrifty sons of the vikings have built themselves excellent and inviting homes." The synod consists of 8 ministers and 34 congregations, of which 16 are in North Dakota and Minnesota and 18 in Canada; the communicant membership is 3,726, whose church property is valued at \$40,975. The synod supports excellent Sunday-schools, an active Luther League, and Prof. Frederick J. Bergman as teacher in Wesley College, at Winniford. The synod has no institution of learning of its own; but it has a well-edited church paper, a Sunday-school paper, and political and literary journals. The whole number of Icelanders in North America does not much exceed 15,000. The officers of the synod are: The Rev. Jon Bjarnason, Winnipeg, Manitoba, president; the Rev. Frederick J. Bergman, Gardar, N. Dak., vice-president; the Rev. Bjorn B. Jonson, Minnesota, Minn., secretary; and Mr. Jon A. Blondahl, treasurer. The great need of the synod is a larger number of ministers, and mission work is carried on with great zeal. The next convention will be held at Argyle, Minn., in June, 1903.

German Iowa Synod.—The largest and most active of the independent synods is the German Evangelical Lutheran Synod of Iowa, organized in 1854, consisting of 451 ministers, 824 congregations, and 74,058 members, with a population of 150,000. The sum of \$352,341.51 was raised in 1902 for church, missions, education, and other purposes. The synod has a very efficient theological seminary at Dubuque, Iowa, a college at Clinton, Iowa, a teachers' seminary at Waverly, and two orphanages, also in Iowa. The synod is divided into 7 districts, covering all the territory from North Dakota to Texas, and from Ohio to Washington. These district synods meet annually, while the Iowa Synod proper, as a delegate body, convenes triennially. The last convention was held at Dixon, Ill., Aug. 19-26, 1902. The following are its officers: The Rev. John Deindorfer, D. D., Waverly, Iowa, president; the Rev. Fr. Richter, D. D., Clinton, Iowa, vice-president; the Rev. Emil H. Caselmann, Charles City, Iowa, secretary; and Prof. August Engelbrecht, Waverly, Iowa, treasurer. Besides the sessions at which much business was transacted, pertaining to missions and education, a large portion of the time was devoted to doctrinal discussion.

The subject discussed was What are the duties imposed upon Christian parents and congregations by the baptism of children? The General Council was represented at this convention by the Rev. Gottlieb C. Berkemeier, D.D., of Mount Vernon, N. Y. The next meeting will be held at Waverly, Iowa, in 1905.

General Lutheran Conference.—The second general conference of Lutherans in North America was held in Philadelphia, Pa., April 1-3, 1902. Representatives in large numbers were present from the General Council, General Synod, and United Synod of the South, and numerous topics bearing on the doctrines, worship, and life of the Church were discussed. The opening address was delivered by the Rev. Prof. Henry E. Jacobs, D.D., LL.D., dean of the theological seminary at Mount Airy, Philadelphia, who called attention to the fact that while the center of the Lutheran population is west of Chicago, the people of the three general bodies represented in the conference are massed mainly near the Atlantic coast, the original home of the early Lutheran settlers in this country. The following subjects were presented in carefully prepared papers, and discussed by the conference: Justification by Faith, the Rev. L. G. M. Miller, D.D., Roanoke, Va.; The Doctrine of Justification in its Relations, the Rev. Prof. J. W. Richard, D.D., Gettysburg, Pa.; The Relation of Young People's Societies to the Congregation, the Rev. C. Armand Miller, New York city; The Place of the Holy Spirit in Lutheran Theology, the Rev. Jason C. Moser, D.D., Hickory, N. C.; The Lutheran Doctrine of the Sacraments, the Rev. L. E. Busby, D.D., Salisbury, N. C.; Christian Liberty and its Limitations, the Rev. Prof. Stephen A. Repass, D.D., Allentown, Pa.; The Historical Deaconess Work and American Conditions, the Rev. Gottlieb C. Berkemeier, D.D., Mount Vernon, N. Y.; Parochial Schools in Relation to our Congregations, the Rev. George C. F. Haas, D.D., New York city; A Native Ministry for Congregations in Foreign Fields, the Rev. J. H. Harpster, D.D., Guntur, East India; Women as Helpers in the Practical Work of the Church, the Rev. J. P. Krechting, D.D., New Germantown, N. J.; The Spiritual Priesthood of Believers, the Rev. John A. Hall, D.D., Canton, Ohio; Are our Present Methods of Sunday-School Work Adequate? the Rev. David H. Geissinger, D.D., Pittsburgh, Pa., and the Rev. Prof. J. A. Singmaster, D.D., Gettysburg, Pa.; The Attitude of the Lutheran Church toward Current Discussions concerning the Holy Scriptures, the Rev. F. H. Knubel, New York city; Problems of Church Polity, the Rev. Prof. Jacob Fry, D.D., Philadelphia; The Defamers of Luther, the Rev. J. J. Young, D.D., New York city.

Luther League of America.—This association of young people of the Lutheran Church held its fifth national convention in St. Paul and Minneapolis, Minn., July 8-10, 1902. Representatives of 14 States, numbering 200, were present. The officers of the society are: William C. Stoever, Esq., Philadelphia, Pa., president; C. G. Grauer, Buffalo, N. Y., recording secretary; the Rev. Charles K. Hunton, Columbus, Ohio, statistical secretary; the Revs. Charles L. Fry, Philadelphia, Pa., and George H. Schnur, Chillicothe, Ohio, literary secretaries; and Mr. John F. Dinkey, Rochester, N. Y., treasurer. The first session of the convention was held in the First Swedish Church of St. Paul, which is also the oldest Lutheran church in that city. The business sessions were held in the English Memorial Church, beginning on Wednesday, July 9, 1902. Among the reports presented was that of the sta-

tistical secretary, the Rev. Charles K. Hunton, of Columbus, Ohio, which estimated the membership of the league at 34,305, although a large number of leagues had not reported. A conservative estimate places the total membership at 70,000. A large part of the time of the convention was devoted to the discussion of papers read. The topic of the convention was Praying and Working; Working and Praying, and this theme was chiefly considered in all the papers and addresses. The first paper was by the Rev. John E. Whitteker, D.D., of Lancaster, Pa., on Working and Praying must be Joined. The second paper was by Miss Josephine Maedel, of Kansas City, Mo., on Power and Prayer. Other papers followed bearing on different phases of the general subject, as Prayer without Work; Work without Prayer; Praying and Working—the Forces Moving the World. The interest of the convention was enhanced by the presence of Miss Ellen M. Stone, lately released from captivity among the brigands of Bulgaria, who spoke of her experience and release from captivity as a wonderful result of the power of prayer. According to its usual custom, the convention held a grand rally meeting, as its final session, in the auditorium, which comfortably held the 2,500 persons present. A special feature of this meeting was the Luther League Chorus of 200 voices, under the direction of Peter Johnson, of the First Swedish Church of St. Paul. Among the selections rendered by this chorus was Luther's great battle hymn—A Mighty Fortress is our God.

The most conspicuous event of 1902 in the history of the Luther League of America, as reported by the Rev. Charles L. Fry, of Philadelphia, is the election of its first general secretary, who is to devote his entire time to the furtherance of the league's work and have general oversight of its affairs. The election was held in Philadelphia on Nov. 15, 1902, and resulted in the unanimous choice of the Rev. Luther M. Kuhns, of Omaha, Neb. The major part of his support was generously tendered by the Luther League Review, a monthly published in New York city in the interest of the association. The league has also added another proof of its substantial value to the church as an educational factor, especially among young people, by beginning the publication of a Lutheran Calendar, under the editorship of the Rev. Charles L. Fry, giving 365 data of all phases of missionary activity and rescue work now prosecuted by the Lutheran Church in all countries on the globe. The salient features of each institution and agency named, from Jan. 1 to Dec. 31, are set forth in a few terse sentences. Women's missionary societies, representing the General Synod, the General Council, and the United Synod of the South, have combined with the Luther League in publishing and circulating the calendar. To bring about such a cooperation of all the bodies in the Lutheran Church of America was one of the chief objects of the league's organization.

The Lutheran Liturgical Association.—This association was organized at Pittsburgh, Pa., Oct. 3, 1898. Its officers are: The Rev. Luther D. Reed, Allegheny, Pa., president; the Rev. Prof. Elmer F. Krauss, Chicago, vice-president; the Rev. R. Morris Smith, Baden, Pa., secretary and treasurer; and the Rev. Prof. George J. Gonga-ware, Greensburg, Pa., archivarius. Its membership consists of clergymen and laymen in all parts of the Lutheran Church who are interested in promoting beauty, correctness, and a desirable uniformity in the external life of the Church.

upon the basis of a study of liturgical history in general and of the liturgical principles and usages of the Lutheran Church in particular. Its interests embrace the entire liturgical field of public worship and Christian art, and all that these include in liturgy, architecture and ornament, church music, hymnology, and ministerial acts. Monthly meetings are held in the First Lutheran Church, Pittsburg, Pa., at which papers are read and discussed. Many of these papers embody the fruits of years of investigation. They are published in the *Memoirs* of the association.

Payment of 50 cents annual subscription to the *Memoirs* constitutes the subscriber a member of the association and entitles him to every publication as it is issued during the current year. Nine papers were published in 1902, and these are now available in a bound volume. The association has had a remarkably rapid growth in membership and in the distribution of its literature. The present membership numbers 410, representing 20 States of the Union and the 4 general bodies of the Lutheran Church in America, besides various independent synods.

M

MADAGASCAR, an island colony of France, near the southeast coast of Africa, formerly a kingdom, proclaimed a French protectorate in 1885 and declared a colony on Aug. 6, 1896. The colony is administered by a Governor-General, Major-Gen. Gallieni. The area of the island is estimated at 227,750 square miles, including the small islands of Nossi Bé, Sainte Marie, and Les Îles Glorieuses. The population at the end of 1900 was 2,244,872, composed of 2,242,443 natives, 488 Asiatics and Africans, 1,193 French, 374 English, 33 Germans, and 341 other Europeans. In 1901 there arrived 157 French immigrants, against 122 in 1900. The civilian officials number 760. Slavery was abolished in 1896, and forced labor on public works in 1901, when the personal tax was increased from 5 to 10, 15, or 20 francs and in the capital to 30 francs. Antananarivo, the capital, formerly the seat of the Hova dynasty, has about 50,000 inhabitants. The Hovas, who ruled the island before the French conquest, are a Malayan people who were partly civilized, and the majority nominally converted to Christianity. They number about 850,000. The Christian population in 1895 was estimated at 450,000 Protestants and 50,000 Catholics. A large proportion of the Protestants have since become Catholics. The French have organized a system of public schools wherever their actual jurisdiction extends unless mission schools were already in existence. The ordinary revenue in the year ending June 30, 1901, was 19,400,000 francs, and expenditure 17,100,000 francs. The French Government gives a subvention of 700,000 francs, but the expenditure of France in 1902 was 31,340,003 francs in addition to this. The old Malagasy debt was converted in 1885, and a loan of 60,000,000 francs has been raised for public works. The cost of the garrison in 1902 was 12,142,120 francs. There were 50 French officers, 8,763 French troops, and 8,235 native and African troops. The value of imports in 1900 was 39,895,897 francs; of exports, 10,623,810 francs, including 3,600,000 francs for gold and gold-dust, 2,025,000 francs for raffia, 1,825,000 francs for caoutchouc, 1,150,000 francs for cattle, 500,000 francs for hides, 500,000 francs for wax, and 225,000 francs for vanilla. The principal imports are textiles, beverages, flour and meal, and metal goods. Three French steamship lines run to the port of Tamatave, on the east coast, which has a population of 15,000. The number of vessels entered and cleared at all the ports during 1900 was 12,823, of 2,018,951 tons, of which 1,823,136 tons were French. The chief occupations are cattle-raising and agriculture. Rice, manioc, sugar, coffee, cotton, cacao, vanilla, tobacco, and sweet potatoes are the principal cultivated products. In the forests are obtained rubber and many valuable woods. The forests are preserved

by law. French settlers receive farms of 100 hectares free, and the same amount of land can be obtained by foreigners at a fixed price. The natives weave silk, cotton, and raffia fiber, and are skilful workers of metals. Gold is found in many districts, and copper, galena, sulfur, graphite, and lignite exist in extensive deposits, but are not mined on a large scale. There were 300 mining concessions, covering 1,425,000 acres in 1900. Many Boers during and after the South African War went to Madagascar, and some of them acquired land for settlement. Roads have been built by the French, who expended 3,126,405 francs for the purpose in 1899. The lagoons on the east coast are being connected by canals. There are 2,610 miles of connected telegraph-lines. The railroad from Tamatave to Ivondro connects with the canal, and from Jaroka, another point on the lagoons, a railroad is being built to Antananarivo, situated on the interior plateau. The western port of Mojanga has been improved and in 1902 exported 6,000 cattle. In 1901 prospectors for gold located 322 new claims, but only 60 placers were worked. The quantity of gold exported in 1900 was 1,114 kilograms; in 1901, 1,045 kilograms. Diego Suarez, where a French colony was established in 1895, has been converted into a first-class naval and military port. French enterprises and settlements are most numerous in this northern part of the island, and here several Boer families of French descent have located farms. With the completion of the road from Antananarivo to the series of coast lagoons and canals the system of human portage began to give place to transport in carts, drawn at first by men, who are being replaced by mules and oxen.

MAINE. (See under UNITED STATES.)

MANITOBA, a province of the Dominion of Canada; area, 73,956 square miles; population in 1901, 254,947. Capital, Winnipeg.

Government and Politics.—The Government of Mr. Roblin remained unchanged during the year, and also kept its place as the only one of the provincial governments of Canada that was purely Conservative. The executive was made up of R. P. Roblin, Premier, President of the Council, and Commissioner of Immigration and Railways; J. A. Davidson, Treasurer and Commissioner of Provincial Lands; D. H. McFadden, Provincial Secretary and Municipal Commissioner; C. H. Campbell, Attorney-General and Minister of Education; Robert Rogers, Minister of Public Works. The Legislative Assembly was made up of 26 Conservatives and 13 Liberals, under the leadership of T. Greenway, and 1 Independent, with W. Hespeler as Speaker. The session was opened by Lieut.-Gov. Sir D. H. McMillan, on June 9, 1902, with a speech from the throne, of which the following are the significant portions:

"The abundant harvest vouchsafed by Providence has been a source of great prosperity to the province. The Canadian Northern Railway Company have completed their line to Port Arthur. The much-needed consolidation of the statutes is being proceeded with by the commissioners, and will, it is expected, be completed within the year.

"I regret to say that the Federal Government has, notwithstanding the strenuous exertions of my Government, as yet failed to pay over to the province the accumulated interest upon the school moneys and the interest derived from the sales of school lands. You will be asked to take measures to convince the Federal authorities that the just demands of Manitoba in this respect should not be any longer disregarded. In consequence of the existing situation, it may be necessary to introduce legislation dealing with the moneys now paid to schools and to amend the school act. The Federal Government has, to the surprise and regret of my advisers, disallowed the real property act passed by this Assembly. This act was so obviously beneficial that it has been decided to reintroduce it, in the expectation that a measure purely provincial, and urgently called for, will not again be disallowed."

The House was prorogued on March 1 by the Lieutenant-Governor, who assented to several enactments, in the King's name, of which the following were the most important:

Respecting real property in the province of Manitoba.

Respecting Mennonite village agreements.

To amend the game protection act.

To amend the bills of sale and chattel mortgage act.

To provide for a charter for the city of Winnipeg.

To amend the assessment act.

To amend the corporations taxation act.

Respecting certain guaranteed bonds of the Canadian Northern Railway Company.

To amend the Manitoba interpretation act.

To amend the Manitoba trustee act.

To amend the public schools act.

Finances.—The budget speech of the Hon. Mr. Davidson was delivered on Feb. 4, 1902. He first dealt with the assets of the province, including \$3,578,941 in Dominion Government capital account, and \$314,853 in the same account, which the Federal authorities had not yet admitted as due by them to the province; \$99,259 advances by the province to municipalities; \$850,104, the value of public buildings owned by the province; 7,700,000 acres of provincial lands at \$3 an acre, \$23,100,000; \$41,065 drainage districts interest account; and \$145,903 cash on hand. The liabilities consisted of provincial debentures valued at \$4,040,013, and, deducting this from the total assets of \$28,130,128, left a surplus of direct assets over direct liabilities of \$24,090,115. He pointed out that there were also indirect assets and liabilities that balanced each other and were made up of guarantees on bonds of the South-western Colonization and Canadian Northern Railways and drainage district debentures. The ordinary receipts of the year were \$371,196, and the expenditure for matters over which the Government had control was placed at \$380,571.

He explained the use to which the \$500,000 loan of the preceding year had been put. The expenditures in this connection included \$238,146 upon the Greenway Government deficit; \$54,812 on public buildings; \$14,472 on the foundation of the Parliament buildings; \$17,772 on railway bonuses; \$7,775 given to Souris Branch Railway;

\$1,996 land refunds; \$7,417 interest on Emerson and Minnidosia loans; \$32,420 on drainage debenture interest; \$4,592 on half-breed mortgages; \$31,276 on seed-grain loans; and \$21,636 on land surveys—a total of \$442,310. "This," he explained, "is decreased by receipts on ledger accounts—such as school debentures, seed-grain loans, creamery loans, and other items—to the amount of \$27,717.91, leaving a total expenditure of \$414,592.97. This leaves \$85,407.03 of the loan unaccounted for. The surplus last year was \$11,051.34; this year, \$49,444.73. The total of these three items is \$145,903.10, which is the cash on hand." According to the public accounts the total expenditure of the province for the year ending Dec. 31, 1901—less certain items in open ledger and trust accounts—was \$988,250.

The estimates for 1902 were presented to the Assembly by Mr. Davidson on Feb. 4. The total proposed expenditures were \$1,288,868, and the total revenue was placed at \$1,534,613. The estimated revenue included a Dominion subsidy of \$557,513; interest on school lands' fund, \$350,000; fees from land titles of \$90,000; interest, \$38,000; from provincial lands, \$20,000; from lunatic asylums, \$48,000; succession duties, \$10,000; insurance act fees, \$14,600; corporation tax, \$32,000; railway tax, \$100,000.

Prohibition.—This question went through a new and important phase in 1902. The liquor act passed by the Macdonald Government in 1900, as a result of strong pressure at the polls and of a plebiscite in favor of prohibition two years before, which had recorded 12,270 votes for and 2,974 against, was now submitted to another referendum. The act, which practically prohibited the sale of liquor in the province, had been declared constitutional by the Judicial Committee in London; but instead of putting it in force by proclamation, the Government decided that conditions had changed, and that the 49,304 votes on the rolls which had not been polled for or against the policy should be considered. It was therefore decided to refer to the people the whole question of putting the law into force. The conditions of the vote were complicated. If 45 per cent. of the registered electors vote "Yea," then the law should take effect. Again, if 60 per cent. of those on the lists voted, and if 60 per cent. of those voting declared themselves in the affirmative, the act should become effective. But if fewer than 60 per cent. of the entire electorate voted, then the proportion required might be raised to 66½ per cent. of those voting, according as the total fell below 60 per cent.

By this arrangement, 36 per cent. of the registered votes would be entitled to enact prohibition. The result of this policy was a species of chaos in the temperance ranks. The Manitoba branch of the Dominion Alliance met on June 16 and passed resolutions, by a nominally unanimous vote, expressing non-confidence in the sincerity of the Government and its desire to enforce the liquor act, and advising Prohibitionists not to vote.

W. Redford Mulock, K. C., took a prominent part in arguing the unconstitutionality of the referendum. The resolutions were promptly presented to the Government, and in reply the Premier would only promise careful consideration. In the Legislature the Government policy was discussed at length, chiefly in connection with the second reading of the referendum bill on Feb. 25. The Attorney-General, in moving the measure, had explained its nature, its limitations, and the reasons for its enactment. Mr. Greenway, the

Opposition leader, declared himself to be the first prominent politician in the province to promise the Prohibitionists (in 1899) all they asked, and the first also to be turned down because of that position. The whole thing was a party question. He personally intended to go out and vote in favor of the enforcement of the act. Would the temperance people, for chagrin or vengeance, allow it to go out to Canada and the world that they did not want their own act?

The Premier's personal opinion of the liquor act of 1900 was expressed in a letter which was made public: "It is no prohibition bill whatever; it is simply a bill providing for free whisky without any control by the Government, which any man in the province can get at any hour and in all quantities that he desires. That being the fact, I do not think the indorsement or otherwise of the act is justification for classing a man a Prohibitionist or otherwise."

Meanwhile, the Dominion Alliance, on Dec. 26, 1901, had petitioned the Governor-General and the Lieutenant-Governor, asking them to disallow the act on the ground that the reference to the people would be subversive of the principles of representative and responsible government and injurious to the dignity and prerogative of the Crown, if not *ultra vires* of the British North America act. The Hon. Mr. McFadden, in a report to the Lieutenant-Governor on March 27, mentioned the fact of the measure's passing unanimously, and concluded that the questions involved were wholly within the constitutional rights of the province. On April 2, 1902, the vote was taken, and it resulted in the distinct defeat of the measure. The official statement of May 5 showed 73,897 entitled to vote, 38,071 actually voting, 22,464 voting against the act, and 15,607 for it.

Agriculture.—The prosperity of the province, as shown in its agricultural production of 1901 and 1902, was phenomenal. In the former year its farmers sold 50,502,085 bushels of wheat at \$25,251,042; 27,796,688 bushels of oats, \$7,505,078; 6,536,155 bushels of barley, \$2,287,304; 266,420 bushels of flax, \$319,704; 62,261 bushels of rye, \$24,904; 16,349 bushels of peas, \$9,809; 4,797,433 bushels of potatoes, \$1,199,358; 2,925,362 bushels of roots, \$292,536; 5,208,740 pounds of butter, \$837,964; 1,039,392 pounds of cheese, \$8,348; poultry and eggs, \$250,000; cattle (44,500), \$1,052,000; hogs (25,000), \$250,000—a total of \$39,368,051.

According to an official bulletin issued at Winnipeg on Dec. 12, 1901, the area under wheat had been 2,011,835 acres; the average yield per acre was 25 bushels. Under oats there was an area of 689,951 acres, with an average yield of 40 bushels. Under barley the area was 191,009 acres, with an average yield of 34 bushels. In flax, rye, and peas the total production was 345,030 bushels and the acreage 24,564. The total grain-crop of the province with its 35,000 farmers was 85,179,858 bushels. In potatoes there was an acreage of 24,429 and an average yield of 196 bushels to the acre. In roots the area under crop was 10,214 acres and the average yield 286 bushels. In 1901 the farmers of the province sold 77,220 turkeys, 33,940 geese, and 306,365 chickens. They erected new buildings to the value of \$1,434,880, and broke in 149,305 acres of new land for the crop of 1902.

Dairying was described in the bulletin as steadily increasing, and lists were given of 28 creameries and 37 cheese factories in the province. Of provincial lands available for sale at prices ranging from \$2.50 to \$6.50 an acre, there were in the beginning of 1902 about 2,000,000 acres.

The final bulletin for the year of the provincial Government was issued on Dec. 6, and gave the following statistics: Wheat area in crop, 2,039,940 acres; average yield, 26 bushels; total yield, 53,077,267 bushels. Oats, area in crop, 725,060 acres; average yield, 47.5 bushels; total yield, 34,478,160 bushels. Barley, area in crop, 329,790 acres; average yield, 35.9 bushels; total yield, 11,848,422 bushels. Flax, area in crop, 41,200 acres; average yield, 13.7 bushels; total yield, 564,440 bushels. Rye, area in crop, 2,559 acres; average yield, 19.5 bushels; total yield, 49,900 bushels. Peas, area in crop, 1,596 acres; average yield, 21.4 bushels; total yield, 34,154 bushels. Potatoes, acres, 22,005; bushels, 159; total bushels, 3,459,325. Roots, acres, 12,175; bushels, 265; total yield, 3,240,995 bushels. The total grain-crop of the province was 100,052,343 bushels. The poultry disposed of by farmers included turkeys, 83,905; geese, 34,270; chickens, 363,020. The land prepared for the crop of 1903 included breaking, 151,395 acres; fallowing, 563,730 acres; fall plowing, 1,015,870 acres. The total area prepared for the crop of 1903 was 1,730,995 acres.

Provincial Boundaries.—This subject was much discussed in connection with the claims of the Northwest Territories for provincial status and the consequent possibility of fixing boundary-lines. In the Manitoba Legislature a resolution was presented by the Premier on Feb. 28, 1902, and unanimously passed. It declares:

"(1) That this House is of the opinion that it is desirable, both in the interests and for the welfare of the province of Manitoba and the Northwest Territories, that the area of the former should be increased by an extension of boundaries so as to embrace and include a portion of the districts of Assiniboia and Saskatchewan, and northward to Hudson Bay. (2) That a committee—consisting of such members of this House as comprise the Executive and Messrs. Greenway, Mickle, and Burrows—be appointed to make all due inquiries into all and singular the best means of bringing about the said object, and to ascertain the most favorable terms and conditions upon which the boundaries of the province may be so extended."

The Grain Act.—A measure passed the Parliament of Canada this year and had its second reading in the Commons on May 7, dealing with important regulations regarding warehouses and station platforms, etc. It varied little in its final form from the bill as originally drawn by Mr. Sifton after consultation with the western Liberal members. The measure provided that buyers must receive all six standard grades; this was designed to meet a difficulty that farmers met with at a few points last season, when buyers refused to make room for the best grades of wheat. As to flat warehouses, there could be as many at any station as the commissioner thought necessary, and the railways would be obliged to furnish locations on a siding for all approved by the commissioner. Railways must within thirty days erect a suitable loading platform at any station, upon a petition from 10 farmers resident within 20 miles. There was to be no charge for the use of such loading platform; and where there was no loading platform the railways were to furnish cars for direct loading.

Provincial Lands.—On Feb. 4, 1902, the report of the department showed land sales of \$150,286; deferred payments of \$46,284 principal and \$17,074 interest; and miscellaneous receipts of \$6,992. In the year 161,786 acres had been sold for \$482,289. The prices ranged from \$2 to \$8 and averaged \$2.99 an acre. There was an in-

crease over 1900 of 91,930 acres sold, and the average price was 10 cents an acre greater. The total area of land acquired by the province was stated at 1,689,250 acres, and 291,897 acres had been sold.

Public Works.—Mr. Rogers reported on Jan. 30 to the effect that the Municipal Councils were rapidly learning the value of proper road work. Colonization roads had been built into several districts not supplied by railways. A road had been built for this purpose to Edrans, south of Arden. An outlet had been given the settlers in Gimli district, the Fairford road had been improved, a road was built near Whitemouth, and one was started that would run from Vassar to Pine River. The only bridges of importance completed during the year were at Portage la Prairie over the Assiniboine and at Rapid City over the Little Saskatchewan. Grants were made, to the amount of \$10,000, to assist in building bridges in other parts of the province. A great deal of work had been done in constructing drains. The Government had not only given financial aid to municipalities for this purpose, but had placed the services of engineers at the disposal of authorities.

Education.—The school population of Manitoba in 1901 was 63,881; the number of pupils registered was 51,888; the average attendance was 27,550; the number of teachers was 1,669, of whom 618 were men and 1,051 were women. According to the official report for the year ending Dec. 31, 1901, the total receipts were \$1,310,805, against \$1,229,878 in 1900, and including \$113,451 from legislative grant and \$653,359 from municipal taxes. The expenditures were \$1,272,616, including \$582,325 for teachers' salaries; \$148,987 for buildings, furnishing, etc.; \$35,415 for fuel; \$50,634 for repairs, etc.; and \$15,713 for salaries to officials. The assets were given as \$2,440,804—taxes due and value of school properties. The liabilities, chiefly debentures, were \$1,155,420. The organized school districts numbered 1,206, and 1,064 were in operation. In 283 schools religious exercises were used in closing, in 169 the Bible was used, in 879 temperance instruction was given, in 925 moral instruction was given, and in 254 the Ten Commandments were taught. During the legislative session two important measures were introduced and passed by the Government dealing with Galician education and the organization of the school districts.

Railways.—Railway facilities in the province were considerably expanded in 1902. Early in 1901 negotiations were concluded between the Government, the Northern Pacific and Manitoba Railway Company, and the Canadian Northern Railway Company for the control and operation, under secure conditions, of the system of the former company in Manitoba. The arrangement concluded was, shortly, the leasing by the Government of Manitoba for nine hundred and ninety-nine years of all the branch lines of railway of the Northern Pacific and Manitoba in consideration of the payment of the following rentals, namely: For the first ten years, \$210,000 a year; for the second ten years, \$225,000 a year; for the third ten years, \$275,000 a year; and for the rest of the term, \$300,000; and, in turn, the assignment of the lease by the Government, upon regular terms and conditions, to the Canadian Northern Company. The actual mileage of railway acquired from the Northern Pacific and Manitoba Railway was 354.65.

Contemporaneous with the acquisition of the lines of the Northern Pacific and Manitoba Railway Company in the province of Manitoba, the

Government, by agreement bearing date Feb 11, 1901, confirmed by act of the Legislature on March 20 of the same year, contracted to and with the Canadian Northern Railway Company, to aid that company by guaranteeing its bonds at the rate of \$20,000 a mile for a line of railway, estimated at 290 miles, extending from Port Arthur to, and connecting with, the lines of the company already constructed and opened for through traffic between Port Arthur and Winnipeg, on or before Oct. 1, 1901, unless unforeseen difficulties should arise through inability to secure men and materials. At the request of the company, the time for completion of the works was extended to Dec. 31, 1901. The Premier was able to announce in January, 1902, that the company had practically completed their contract on the latter date, "thereby giving to the people of the province of Manitoba, under most favorable and advantageous terms and conditions, an independent line of railway to the head waters of Lake Superior."

The mileage of the Canadian Northern Railway, in and outside the province, with respect to which a guarantee liability on the part of the province exists—when the whole system is completed—is 979 miles. The extent of the liability upon guaranteed debentures will be \$11,195,280.

The total amount of cash aid given by the province toward the construction of railways in Manitoba, at the close of 1901, was \$971,557, covering 545 miles. This was exclusive of the \$75,000 promised the Canadian Pacific Railroad for the Forrest and other extensions.

The direct liability of the province, at the close of the year, with respect to the Manitoba and Northwestern Railway, was approximately \$787,426, to cover which, with the interest to accrue until the maturity of the debentures, the province held as security 542,600 acres of land in the Northwest Territories.

The Doukhobors.—The main body of this sect, about 15,000 in number, occupies the high plateaus of Transcaucasia, in Russia. Here, where the rigors of the climate will not permit the maturing of ordinary crops, are great natural meadows, and cattle-raising is almost the sole industry. The inhabitants live largely upon beef; every year hundreds of animals are broken to the yoke, and one of their chief sources of wealth is the carrying of freight in their ox-wagons over the rough mountain roads. The society was founded in central Russia in the early part of the eighteenth century, and the name, given to it many years afterward by one of its leaders, is compounded from two Russian words: "doukh," meaning "spirit," and "bor," an abbreviation of "boratsia," meaning "to wrestle." Fanaticism has marked the history of these Doukhobors, or Spirit Wrestlers, from their inception, and they have suffered not alone from the terrible persecutions of the state and the church, but even more from the tyranny of their leaders, who from the beginning made themselves absolute in their power. These taught, in addition to the doctrine of the founder—that God dwells in the human soul, and that this indwelling essence is the supreme guide to life and light—that Christ himself was merely a sinless man, whose purity gave force to the divinity within him, and that their leaders were also sinless men, qualified by their superior excellence to guide the people. They also taught that it was a sin to read and write, that the Bible was not inspired, and that printing was the invention of Satan to lure souls to destruction. One of their leaders, toward the middle of the century, declared himself Christ's rep-

representative on earth, and surrounded himself with 12 apostles and 12 archangels to do his bidding. Kapustin, who followed him, taught that God in men dwelt in his fullest power in the most godlike men. This power was in him; therefore he was God. He called upon his followers to fall down and worship him, and brought down a flood of hatred and persecution upon the sect. Many of the Doukhobors were cast into prison, and all the powers of the church and the state were directed

and peace in a new land. Negotiations were opened with several governments in an endeavor to establish them in a colony, and finally they were accepted by Canada. The first colony, 2,000 in number, arrived early in 1899, under the leadership of Count Leo Tolstoy, who with other philanthropists had become interested in their welfare, and were granted free lands in Manitoba. The first impressions of the Doukhobors were most favorable, and in the following year their number was increased by additional immigration to about 7,000 in Manitoba and the Northwest Territories. The Government loaned to the poorer families seed, plows, and other facilities for making their first crop. About three-fourths of this loan was repaid out of the crop of 1900. They had the esteem of all their neighbors, filled the schools with their children, and were rapidly learning to speak and read the English language. The climate, so similar to that of their old home in the highlands of Transcaucasia, seemed especially adapted to their advancement, and from poverty they had struggled into comfortable circumstances and many were saving money. A few realized the necessity of adapting their beliefs to their new conditions of life; but the great majority, particularly those of the Swan river settlements, in Manitoba, and about Yorkton, Assiniboia, clung to the old doctrines. In addition they adopted a vegetarian diet, refusing not only to eat butter, eggs, or any article of food that was even remotely connected with an animal, but as well to wear any clothing of animal origin or to use cattle or horses as beasts of burden.

Their first difference with the Canadian Government came about through their refusal to take the patents for their land individually, insisting that all holdings should be communal. Then they refused to comply with the laws of the Dominion in regard to marriage and divorce, insisting upon settling all these questions according to conscience and their interpretation of the Bible. In 1901 the Swan river Doukhobors, mindful of their lifelong feud with the Russian Government, refused to pay the school taxes. Their stock was seized and sold to meet the arrears, and this seems to have taught them a permanent lesson. They are gradually adopting the use of animals for heavy farm work, and very few, if any of them, joined their brethren in the uprising of 1902. Their strange beliefs excited much curiosity and interest, but no serious trouble was expected until the summer of 1902, when, without warning, they turned all their horses, cattle, and sheep loose upon the prairies, and men and women took their places at the plow and hauled the heavy loads of farm produce to the towns, in some instances 50 miles distant. The mounted police rounded up the herds, and the stock was sold by the Government and the money put to the credit of the communities. The harvest was gathered with reaping-hooks and thrashed out with flails. During the autumn agitators continued to work among them, and the people, earnest in their faith and unshaken in their belief in their leaders, gathered in great meetings. From time to time came rumors of villages deserted, and of mobs of fanatics preparing for a descent upon Yorkton in a great pilgrimage to seek Jesus, from whom they believed themselves to have received a message that his second coming was near at hand. These rumors were denied persistently by the authorities, who must have known the truth, and the result was that when, on the night of Oct. 27, between 1,500 and 2,000 Doukhobors, men, women, and children, camped within 3 miles

DOUKHOBORS.

against them. However, they appeared only to thrive under the persecution. In 1801 Alexander I ordered the persecution stopped and released those in the prisons; but he was soon forced to withdraw his kindly treatment, the Doukhobors growing under it even more arrogant and refusing to obey the civil laws. Finally the Doukhobors appealed to the Emperor to settle them in some uninhabited place where they might worship after their own belief without offending the orthodox. They were permitted to remove to the region north of the Sea of Azov, and here thousands of them built homes for themselves. But here, official restraint being removed, they were even more subject to the brutality and passions of their leaders, and within a few years conditions became so horrible that the Government, about 1835, removed the Doukhobors to what was then the wilderness of Transcaucasia. Here they have lived ever since, having almost no relations other than business with the people around them. In recent years, while they have followed implicitly the direction of their leaders in religious matters, under the careful surveillance of the Government officials many of the social and political abuses that they suffered formerly have been done away with.

In 1887 the sect was divided by a rival candidacy for the leadership, and the bitterness of this fight and the hard feelings growing out of it drove part of this unhappy people to seek homes

of Yorkton there was no organization to cope with the situation, and for ten days the Doukhobors overran the country. At no time was there any fear of violence from the pilgrims, for the Doukhobors' doctrine teaches universal peace; but the suffering from cold and starvation was pitiable, and, swayed as they were by their implicit faith in their crazy leaders, all efforts were futile to persuade them to give up the search and return to their farms. All night long fresh bands continued to arrive. Some remained awake, chanting and praying, but the majority, worn out by their long tramp and stupid with cold and hunger, lay down to sleep in the open, with little or no protection from the biting wind and with the thermometer 10° below freezing. In the morning the immigration officials, interpreters, and citizens attempted to persuade them to turn back; but this was only the signal for a fresh outburst of singing and praying, and the mob soon followed the deputation into the town. "It was a motley crowd that entered the public square. First came the men bareheaded, clad in the coarsest cotton garments, and not very much of even those. Most of them walked in their bare feet, but a few wore rubber boots, and some wore short boots made from braids of binder twine. As they marched along they chanted a weird, rhythmic hymn, which at times rose almost to a martial strain. Next in the line came the litters on which the sick were being carried, and at the end of the procession the women and children dragged their feet wearily one after the other. The women were clad much the same as

and the mounted police, cut out from the main body the women and children and the sick, and housed them in available places of shelter. These were not allowed to leave the buildings, and the men, realizing the firmness of the authorities, were forced to abandon them. The women refused all food, and pleaded passionately to be allowed to join the men on the march. During the days following, their condition, and particularly that of the children, was beyond description. Many became insane, all were starving, and all were insistent in their belief that they had received a spirit message and must find Jesus. After a night spent in prayer and the chanting of songs of praise, nearly 600 of the men set out on the long march of 300 miles eastward across the snow-covered prairie to Winnipeg, Manitoba, where they confidently expected to meet the Saviour, who, reincarnated, was to lead them forth to evangelize the world. An eye-witness thus describes the weird procession: "I overtook them at Binacarth, a little village on the Northwest branch of the Canadian Pacific Railway about 200 miles from Winnipeg. They came straggling into the town in a procession 2 miles long. Picturesque figures they were, mostly clad in blue and with gaudily colored scarfs. The wide, flaring skirts of their coats were kilted behind. Though the snow lay 3 inches deep on the ground, fully a score were barefoot. More than double that number were hatless. In front strode a majestic figure black as Boanerges and with a voice like a bull of Bashan. He was barefoot. On his head was a brilliant red handker-

DOUKHOBORS' FLOWING.

the men, and the children were also forced to adopt the inadequate cotton garments. Babies in arms clutched at their mothers' breasts in vain, and their thin, blue little faces, their starved appearance, and their heartrending cries were the first to bring the citizens to a full sense of the seriousness of the situation. Each of the pilgrims carried slung over the shoulder a bag containing about half a peck of bread, made from the whole wheat ground between stones and baked into a hard mass. This was cut into squares and soaked in what water could be found by the roadside to make it edible. This was all the food that the wanderers had brought with them, and it would be exhausted in a very short time. The young children could not subsist upon it, and many were on the verge of starvation."

The immigration officials, aided by cowboys

chief, and his body was clothed in a long, dusty, white felt mantle reaching almost to his feet. The Binacarth people gave them food—dry oatmeal, which they poured in little heaps on blankets, half a dozen pilgrims helping themselves from each heap. The meal was preceded by their favorite chant from the eighth chapter of Romans and by the repetition in unison of prayer. Then the pilgrims sat in parallel lines and ate oatmeal dry from the sack. This, with bread, apples, and the dried rose-haws picked from the prairie rose-bushes, formed their *menu*. After the meal, which lasted about an hour, they repaired to the back yards of the residences, and for a quarter of an hour the pumps were worked without cessation to satisfy their thirst. An hour afterward the procession was formed and the eastward journey resumed. . . . The snow began

to fall in light flakes. The pilgrims halted and made their pitifully inadequate preparations for camping. With their hands they tore up some long grass to serve as beds. From their pouches

that a brief account of them as described by Major W. C. Gorgas, the chief sanitary officer of Havana, will be of interest.

For a century and a half yellow fever has been

DOUGROBORA—THE VILLAGE BLACKSMITH.

each took a handful of dry oatmeal and munched it. Some scattered in the darkness to hunt for the dried fruit of the rose-bush. With no shelter, under the open sky, they lay down on the snowy prairie, wearied with their 20-mile tramp. Before flinging themselves down they sang a psalm and quoted Scripture verses responsively, standing meanwhile with bare heads while the snow fell quietly over them." Many dropped out of the ranks from sheer exhaustion and lack of nutritious food, and many others would have fallen by the way had not their stronger comrades made litters and bore them along. They arrived at Minnedosa, 100 miles west of Winnipeg, in the night of Nov. 7, and on the morning of the 8th attempted to resume their journey, with the thermometer at 10° below zero. They were forcibly detained by the townspeople and farmers until the arrival of a military special train with 500 mounted police. After a slight struggle, the whole body were locked in the cars and carried back to Yorkton, to be forcibly returned to their villages.

MARYLAND. (See under UNITED STATES.)

MASSACHUSETTS. (See under UNITED STATES.)

MEDICINE, ADVANCES IN. The Mosquito Diseases.—The remarkable etiology of yellow fever, which was worked out in 1901 by the Yellow-Fever Commission of the United States in Cuba, has during the past year received practical confirmation in a number of localities, notably in Havana. New measures for combating the disease, based on the mosquito theory, were adopted in that city immediately after the publication of the commission's report.

The altogether astounding results which have been obtained by the first year's application of these methods in Havana leave practically no doubt as to the mosquito's agency in causing yellow fever, and are almost equally emphatic as to this insect's being the sole agency for its spread. The results are so striking and furnish such convincing proof of the truth of the mosquito theory

endemic in Havana. As far back as the historic records go, a month has never passed until the American occupation without a death from yellow fever, "and there has probably in all this time never been a day on which there was not a case of this disease in Havana." Up to July of the first year of the American occupation there was little yellow fever in the city. Then immigrants began to pour in, and about 16,000 reached Havana between July and Dec. 31, 1899. During this period a serious epidemic began.

In February, when Major Gorgas was appointed chief sanitary inspector of the city, a system of compulsory notification was enforced; every case being promptly isolated and quarantined. In case of death the body was buried with all sanitary precautions, and the sick-room thoroughly disinfected. The general death-rate of the city was meanwhile decreasing under the improved sanitary conditions, but the greatest care and watchfulness produced no decrease of the yellow-fever death-rate. The epidemic continued throughout the spring and summer, and reached serious proportions, even for Havana, in the fall. During 1900 there were 1,244 cases, with 310 deaths. All classes suffered. During this work \$25,000 a month was spent, and 300 men employed every day. At the beginning of 1901 the non-immune population was larger than it had ever been before, and hence the conditions were favorable for a still more serious epidemic than that of 1900. The deaths in January and February were numerous. At about this time the results of the Army Board's investigation were published, and Gen. Wood, who was determined to do all in his power to improve the sanitary condition of the city, authorized Major Gorgas to go to any reasonable expense in testing the new theory.

As a result of this decision an ordinance was at once issued requiring all people within the city limits to keep receptacles containing water "mosquito-proof." Inspectors were appointed who went about and enforced this ordinance, ac-

accompanied by men with oil-cans, who covered the surface of all puddles and cesspools about the dwellings, and destroyed all the receptacles in which mosquito larvæ were found. After a sufficient time for compliance with the new rule was thought to have elapsed all persons on whose premises larvæ were found were fined. Fifty men were employed in this work, and 100 men in the suburbs killing larvæ and filling up puddles.

Coincident with these out-of-door measures all hospitals where yellow fever was received were ordered thoroughly screened. In cases occurring in private houses the house was screened by the health department. All infected buildings were thoroughly disinfected with pyrethrum powder; this drug stupefies the mosquitoes, which fall to the floor, and may then be swept up and destroyed.

This was used in preference to more powerful substances, because of its harmlessness to furniture, hangings, etc., and the short time required before the rooms are again ready for occupancy. Forty men were employed in this work. One hundred and ninety men were used in enforcing the new regulations as against 300 during the previous year.

In January, 1901, there were 24 cases of fever, with 7 deaths; in February there were 8 cases and 5 deaths. The new regulations were put in force on Feb. 27. In March there were 2 cases, in April 3, in May 2, and in June none at all. On July 1 all disinfection of so-called fomites—infected clothing, bedding, etc., was entirely discontinued. In July there were 4 cases and 1 death, in August 6 cases and 2 deaths, and in September 1 case. During October, November, and December there were none whatever. October and November have always been months when yellow fever was particularly rife in Havana. There is good reason for believing that the cases after those occurring in May were due to infection from a neighboring suburb, where a yellow-fever epidemic was in progress.

In the first ten months following the enforcement of the new regulations there were only 17 cases of yellow fever, as against something like 1,200 during the corresponding months of the previous year. As Dr. Gorgas says, "this is evidence of the practical demonstration of the mosquito theory."

On Nov. 6, 1902, he was able to say, before the New York Academy of Medicine: "It is now over a year since the last case of yellow fever occurred in Havana, and if the disease can be kept out of the city for twenty years, I think yellow fever will be completely exterminated in North America, for Havana has been the great center of infection."

The later Vera Cruz Yellow-Fever Commission has entirely confirmed the findings of the United States Army Commission in Havana. They attributed the prevalence of the disease in Vera Cruz to the custom of the Mexicans of gathering rain-water for drinking purposes, and allowing it to stand about unprotected. War on these water-barrels has reduced yellow fever in the city over 50 per cent.

Sanitary measures directed against malaria based on the mosquito theory have furnished equally convincing results.

The importance of the practical demonstration of the truth of these startling theories it is hard to overestimate. It may in many sections eventually lead to a large increase of real-estate values, and prove to have an important bearing in determining the feasibility of large engineering enterprises in tropical countries. The one prac-

tically insurmountable difficulty in the construction of the Panama Canal has been the health of the men employed. The work on this undertaking, and also on the isthmian railway, was stopped many times simply by the "dying off" of all the workmen. So that it may be fairly said that the building of the isthmian canal is "more a sanitary than an engineering problem." The two scourges of the isthmian country are malaria and yellow fever, and both of these diseases are now preventible, or at any rate can be controlled and kept within narrow limits by the use of mosquito-netting. Many sections of country in Africa and India are now practically uninhabitable because of malarial fevers, and whole districts in Ceylon have been almost depopulated by malaria; and even in this country in many sections the mosquito is an effective agency in preventing the growth of population and real-estate values. The vexatious and expensive methods of disinfection and quarantine which have heretofore been considered necessary in yellow-fever epidemics, and in the case of infected ships, have already been discontinued in Havana, and will probably soon be discarded elsewhere. Dr. Doty, the health officer of the port of New York, has recommended their discontinuance in that city.

At the annual Conference of State and Provincial Boards of Health of North America, held at New Haven, Oct. 28 and 29, 1902, Major Gorgas offered the following resolution:

"Resolved, That in view of the establishment of the fact that yellow fever is transmitted only by the mosquito, this conference is of the opinion that there is no longer necessity for the disinfection of clothing in yellow-fever cases, bedding fabrics, or effects of any kind, but simply to take measures looking to the control of the sick and the extermination of infected mosquitoes. In cases in which non-immunes have been exposed to infection, they should be observed during the period of incubation."

This resolution was the report of the Committee on Yellow-Fever Resolutions. It was spread upon the proceedings, but the conference refused to commit itself to the "sole mosquito theory."

At the meeting of the American Public Health Association in New Orleans early in December a long discussion of yellow fever and mosquitoes occurred; but although a majority of the delegates believed in the theory which holds the mosquito to be the sole causative agent, a small minority, who remained unconvinced, prevented a resolution favoring open quarantine.

The report of the Surgeon-General of the United States Army for the fiscal year ending June 30, 1902, states that there were recorded during the year 35,180 cases of malarial disease, with a death-rate of only 0.59 per cent. Important results regarding cases of so-called latent and masked infection were obtained at the Presidio general hospital in San Francisco. It is well known that malarial infections may remain latent for long periods. Among the returned soldiers from the Philippines, 219 of the 1,082 cases (20 per cent.) which showed malarial parasites in the blood were found to be of the latent type. The report insists on the importance of blood examinations in all tropical diseases, and states that a malarial infection complicating any other disease seriously compromises the patient's chances of recovery. Cases have been observed where the discovery of the malarial parasite has undoubtedly saved the patient's life.

Of interest in connection with the mosquito diseases is a recent monograph on The Culicidæ of the World, in three volumes, by F. W. Theo-

bald. It has been prepared and published under the direction of the British Institution, and is the most comprehensive work on mosquitoes yet issued. In it are described 300 species, 136 of which are new.

Consumption.—At the first International Conference, held in Berlin from Oct. 22 to 26, 1902, a number of interesting papers were read, but nothing new of great importance was announced. Prof. Fränkel, in the opening address, said:

"There are some points in the etiology of tuberculosis which are still unknown, but nobody nowadays doubts that the bacillus tuberculosis is the essential cause of the disease, and that the destruction of all the bacilli would mean the extinction of tuberculosis. . . . To cure a patient suffering from consumption is a preventive measure, because every patient with active tuberculosis is a danger to the healthy persons with whom he lives. . . . It should [now that sanatoriums are numerous] be the aim of the national societies to popularize the prevention of tuberculosis by the education of public opinion."

One of the most interesting and instructive features of the congress was the reading of the delegates' reports.

Prof. Brouardel stated that France now had 28 sanatoria, of which only 2 were for paying patients. A collective investigation was also under way, with official support.

Dr. Linroth, the Swedish delegate, stated that the first sanatorium in Sweden was opened in 1900 with 100 beds. Since that time two others had been established, the total number of beds now available being 500.

Prof. Schrötter, of Vienna, described but one institution, at Alland, near Vienna, which had 130 beds.

Dr. Egger, of Basle, reported 7 sanatoria in Switzerland, with 416 beds, at which 1,041 patients were received during 1901.

Another one was now in course of erection. These were apparently all free and public institutions, as 12 more private sanatoria were described by him.

Dr. Rördam, of Copenhagen, reported 5 sanatoria for children and 3 for adults in Norway, besides a number now in course of erection. A national association distributes pamphlets showing how to avoid consumption and how to treat it, and has also instituted a course of public lectures for the same purpose.

Dr. G. A. Heron said there were about 1,000 beds available for non-paying patients in England, and about 2,250 for pay patients.

Dr. A. Hillier, of London, a member of the British National Association for the Prevention of Tuberculosis, presented an encouraging report regarding the work of his association, which has 25 branches in England and her colonies.

Reports were also presented from Belgium, Hungary, Roumania, and Russia.

Compulsory notification of consumption was in general favor among the delegates, but was discussed at a private session.

According to Polk's Medical Directory for 1902, there are in New York city 3 hospitals devoted to consumptives, with a total of 468 beds, 2 of them being private institutions; to these may be added the tuberculosis hospital of the Department of Charities on Blackwells Island, with a capacity of 300. In the State of New York there are 2 sanatoria recorded, with a combined capacity of 168, both of them pay institutions.

Boston is credited with 2 hospitals and 70 beds, but there is no sanatorium given in the entire State of Massachusetts.

Philadelphia is given 3 consumption hospitals with 153 beds, and Pennsylvania 1 sanatorium containing 33 beds.

There are apparently no special consumption hospitals in Chicago, and no sanatoria in Illinois.

Bovine and Human Tuberculosis.—An investigation under the direction of Lord Lister has recently been carried out at the Jenner Institute of Preventive Medicine, in London.

The tubercle bacillus was first passed through pigs, cats, rabbits, and rats, and its effect then tested on calves.

The most important results, as they bear on Dr. Koch's pronouncement of last year, occurred in the case of the pigs subcutaneously inoculated with human tuberculous sputum. In 7 of the 8 pigs thus treated the post-mortem examination showed marked tuberculous lesions and disease of the lungs.

In 3 other pigs fed with tuberculous sputum local lesions were found, chiefly cervical and tonsillar. Hence the pig, at any rate, is capable of contracting a rapidly fatal general tuberculosis as a result of inoculation with tubercle bacilli of human origin. "The human tubercle bacillus is not markedly exalted in virulence for the calf by a single passage through the pig, cat, rabbit, or rat. At the same time the experiments show that the human tubercle bacillus is by no means innocuous to the calf, as the control animal infected directly with sputum contracted an extensive glandular tuberculosis." The authors believe that the various other forms of bacilli which must be injected, along with the tubercle bacillus, in the human sputum may have much to do with determining the virulence of the tubercle bacillus itself.

At the annual meeting of the British Medical Association Dr. J. Hamilton (Aberdeen) opened a discussion on the relationship between bovine and human tuberculosis. As the result of extended experiments he had found that the local infection by human tubercle produced in a calf was capable of causing general tuberculosis if transferred to another calf.

The human tubercle bacillus developed slowly in the calf at first, but in time produced general tuberculosis. It took the bacillus some time to get acclimated. The bovine-grown bacillus, as a rule, excited more acute and wide-spread disease than did the human-grown form, but the latter gained in virulence by inoculation from one calf to another.

Prof. Sheridan Delépine (Manchester) said the experiments of Koch were so contradictory to general opinion and to the experiments of other observers that even his great name was not sufficient to weigh down the balance on his side. Personally he had been able to produce in the calf true tuberculosis from human bacilli, and from this he got tubercle bacilli which were still more virulent.

Dr. T. Sherman (Edinburgh) had found that the bacillus tended to increase in virulence in passing through a series of animals of the same species, and to lose its virulence when transferred to an animal of another species.

Dr. Koch, in a brilliant address at the Berlin Congress, reiterated his views expressed in London last year, and was of the opinion that the severe measures concerning bovine tuberculosis prescribed by the sanitary laws were not justified.

Urea and Consumption.—Dr. Henry Harper, an English physician, announced in the early part of last year a series of experiments with urea

as a specific for consumption. He gave a number of theoretical reasons why the drug might be expected to affect the tubercular diathesis favorably, and then described several cases in which he thought its administration had produced a cure.

Dr. S. V. Pearson publishes (*Lancet*, Nov. 22, 1902, p. 385) an account of 7 cases of chronic tuberculosis which were treated with urea at the Brompton Hospital for Consumption. Some of the patients improved in general condition, but none in physical signs; and in several an undoubted extension of the disease occurred.

Dr. Pearson's conclusion was that "in chronic pulmonary tuberculosis there is no special action exerted by urea . . . either in arresting the ravages of the disease or in counteracting the deleterious effect on the constitution." He, however, states that it may have some value in other forms of tuberculosis.

The Diazo-Reaction in Consumption.—Dr. Raoul de Boissière, of the Victoria Hospital for Consumption at Edinburgh, describes a series of tests of the above reaction (*British Medical Journal*, Nov. 15, 1902, p. 1576). His conclusion is that the reaction only occurs in a small number of cases, usually only in those with fever, and in association with an advanced stage of the disease. He agrees with previous observers in thinking the presence of the reaction indicates a bad prognosis.

Cancer.—The year's study of the cancer problem has not produced any marked advance in our knowledge regarding its causation or cure. Cancer research has, however, been systematized and largely extended, especially in England, and definite results of the greatest importance will undoubtedly follow the concerted attack, which is now of world-wide proportions, on this mysterious scourge of the human race.

A scheme has recently been elaborated in England for the purpose of endowing cancer research laboratories at the hospitals. A similar organization exists in Germany. In France cooperative cancer work has been in operation for some time, and a special journal is devoted to the publication of its results. In New York State, at Buffalo, there is a State-subsidized cancer laboratory.

According to the report of the Cancer Commission of the Harvard Medical School, which was made possible by the Carolyn Brewer Croft legacy, the work done in the past two years in the study of the etiology of cancer has been wholly negative in its results, in the sense that an increasing doubt has been thrown upon the parasitic origin of the disease and upon the pathological significance of so-called cell inclusions.

The director of the State Laboratory at Buffalo says, on the other hand, that the results of the past year's work have been to strengthen the conviction that cancer is infectious.

Leopold, of Dresden, thinks "blastomycetes may be the cause of malignant new growths in man; they may convey the disease by inoculation from man to animal, producing exactly similar new growths which are fatal to the animals affected." Among his experiments Leopold mentions the implantation into a rat of tissue from a carcinoma of the ovary. The animal died in sixty-one days from a tumor the size of a walnut, which was found to be an adenosarcoma.

Dr. Henry Morris, a leading London surgeon, opened a discussion on cancer at the meeting of the British Medical Association. He summed up his conclusions regarding treatment in part as follows:

The serum treatment of malignant disease is not of the slightest use in carcinoma. Not one-half of the cases of spindle-celled sarcoma disappear under treatment with Coley's fluid (see last year's *Annual on RECENT ADVANCES IN MEDICINE* for an account of the various modern methods of treatment in which Coley's fluid is described). This treatment has many dangers, and should never be employed except in absolutely inoperable cases. Beatson's treatment is limited in its action to cases of mammary carcinoma, and even in these cases only a small proportion are favorably influenced by it, and it can be relied upon neither as a palliative or cure in any given case. Rodent ulcer has in the Finnsen light and the X rays its most successful treatment so far as we at present know. Sarcoma, epithelioma, and other forms of carcinoma are best treated, whenever possible, by early excision. With few exceptions the attempts to cure cancer by means other than early and free operations have hitherto been almost invariably futile.

The cases of wonderful cures of cancer by various novel remedies which are continually appearing in the medical journals and newspapers are probably, most of them, not cases of cancer at all, but simply some benign form of tumor, which to a cursory superficial examination may present the characteristics of carcinoma.

Serum Therapy. Typhoid Fever.—Dr. A. E. Wright, Professor of Pathology at the Army Medical School, Netley (England), gives a detailed account of the results thus far obtained with the antityphoid serum (*Lancet*, Sept. 6, 1902, p. 651). His conclusions may be summed up as follows: In almost every epidemic the use of the serum has diminished the number of cases at least twofold, and sometimes as much as twenty-eight-fold. Superadded to the diminished incidence a striking diminution of case mortality occurs. "It may be taken that in the aggregate the proportion of deaths to cases among the inoculated is approximately half that among the uninoculated."

The combined effect of the diminished occurrence of the disease and the reduction of the death-rate produce a total decrease of mortality, which has often exceeded and seldom fallen below 75 per cent. There is, says Dr. Wright, a certain amount of risk in all protective inoculation. (a) There is the case where the patient's resistance is naturally low, or has been reduced, as is often the case, by a previous attack of typhoid fever. (b) Where a full dose is inoculated in actually infected surroundings. (c) Where an excessive dose is given or a normal dose too soon repeated.

It must be the task of the future to try to minimize the risk, on the one hand, by working out an adequate method of standardization of the vaccine, and, on the other hand, of combining with the study of the changes produced in the blood by the antityphoid inoculation the study of the blood in the typhoid convalescent and the study of the gradual success or failure of the process of immunization in the actual typhoid attack.

Another and less favorable view of the typhoid antitoxin is presented in a report by Alexander Crombie. As a result of statistics obtained on 250 officers invalided from South Africa during the Boer war he arrives at the following conclusions:

Up to the age of thirty years the advantage of a single inoculation is distinct, the incidence of the disease being 27 per cent., as against 51

per cent. among those not inoculated. Beyond the age of thirty years the results are reversed, the advantage being with the non-inoculated, the incidence among them being only 14.3 per cent., as against 24.7 per cent. among the inoculated.

The first period is that at which susceptibility is greatest. Dr. Crombie also states that a second inoculation increases the susceptibility to typhoid.

In a study of the fatality of typhoid in various sections of the United States at different seasons whose results form No. 59 (vol. viii), 1902, of the quarterly publications of the American Statistical Association, the following table of results showing the death-rate per thousand is given. The year is divided into four quarters, 1 indicating January, February, and March, 2, April, May, and June, etc.

LOCALITIES.	1.	2.	3.	4.
Massachusetts.....	21.1	18.8	17.8	12.8
New York city.....	26.5	24.9	24.1	17.9
Berlin.....	17.1	15.3	11.4	13.8
Providence.....	29.8	45.6	31.7	33.7
Massachusetts General Hospital..	14.8	11.0	11.9	12.0
Boston City Hospital.....	17.6	17.3	12.2	10.8

It will be seen that, contrary to the generally accepted notion, the fall is the least fatal period.

As a result of an investigation of the thromboses following typhoid fever, Drs. A. E. Wright and H. H. G. Knapp, of the Army Medical School, Netley, conclude that the tendency to thrombosis is due primarily to an exclusive milk diet; secondarily to an excess of lime salts in the blood, which much increases its coagulability. The milk should either be decalcified or citric acid be given with it. Decalcification may be accomplished by adding 20 to 40 grains of citrate of soda per pint of milk.

Rheumatism.—Investigations by Drs. Poynton and Paine (Lancet, Aug. 2, 1902, p. 273) indicate the presence of a definite germ in cases of acute rheumatism. This is a diplococcus, which is found in the blood, the valves of the heart, in the pericardial exudation, in the joints, and in the subcutaneous nodules. Pure cultures of this organism when inoculated into rabbits produce symptoms similar to those of acute rheumatism in man.

In the *Zeitschrift für diätetische und physikalische Therapie*, vol. vi, No. 4, July, 1902, Menzer describes a curative serum based on the germ theory of the disease. The germ is obtained by scraping the tonsils of rheumatics; it is cultivated on ascites fluid, and then injected, in graduated doses, into larger animals. The serum thus made is antibacterial (that is, a disinfectant), not antitoxic, and its introduction into the body is supposed to supply the latter with bacteriolytic agents. It at first increases the inflammation, but finally subdues it.

In 20 cases treated with the serum Menzer reports that although there was no appreciable modification of the symptoms until the defervescence stage was reached, after this point convalescence invariably occurred rapidly and with no relapses. Chronic stubborn cases which had resisted all other remedies, including the salicylates, were cured or greatly benefited in two or three weeks' time. Further experiments with an antistreptococcal serum in rheumatism are described in the *Zeitschrift für klinische Medizin*, Nos. 1 and 2, vol. xlvii, 1902, p. 109.

Plague and Cholera.—According to the report of the sanitary commissioners for Bengal, inocu-

lations for cholera have lamentably fallen off, because they are now entirely optional. Inoculation for plague is also decreasing. In Calcutta only 40 were made during the year covered by the report.

During the last fiscal year plague has caused over 200,000 deaths in India. The rapid growth in intensity of the present epidemic has led the Punjab Government to appropriate \$400,000 for a wholesale inoculation of the inhabitants with plague antitoxins. Arrangements were to be made for over 6,000,000 inoculations.

New Serum Institute in Denmark.—Of interest in connection with the growth of the serum treatment of disease is the erection in Copenhagen of a Government school for the instruction of students in serum therapy and manufacture, and for the conduct of original research.

In 1894 Prof. C. J. Salomonsen, director of the University Laboratory of Medical Bacteriology of Denmark, made a request to the Minister of Educational and Ecclesiastical Affairs for a small sum of money (\$2,000 or \$3,000) with which to carry on the manufacture of diphtheria antitoxin. He obtained the grant, and with it, besides making the antitoxin, instituted a small class for the instruction of his students in the technique and theory of serum therapy. The product of the work of the laboratory was distributed free of cost. The experiment proved so satisfactory that a site for a separate serum institute was finally secured on the island of Amager, just outside the old fortifications of Copenhagen. This institution was formally opened on Sept. 9, 1902.

The following general rules may be laid down as the result of the clinical work thus far accomplished with the various sera: The method of administration is of considerable importance. In tetanus (lockjaw), for instance, it has been found that injections near the brain are by far the most effective, direct intracerebral inoculation being desirable. Early use of the sera is of the greatest importance, and their administration is recommended even while the diagnosis is provisional. The dosage should be large; many failures have probably been due to the administration of insufficient quantities. (In this connection, however, see Prof. Wright's statements above regarding typhoid.) Great care should be taken to secure a fresh, undeteriorated product.

Phototherapy.—The recent work in this branch of medicine has been chiefly clinical. According to Dr. L. Freund, of Vienna, all radiant phenomena—the X rays, ultra-violet light, Finsen light, etc., have the same physical basis, and the effect of rays on the body varies, like that of chemical agents, with the dosage, and may range from mere stimulation to actual destruction of tissue.

In weak doses the rays seem to favor organic processes, such as the growth of hair and the production of pigment. In stronger doses they lower vitality and produce inflammatory reaction. The clinical effects of all forms of radiotherapy are similar. The physiological effects are in direct proportion to the intensity of the ray, but in inverse proportion to the wavelengths. The reaction appears after a latent period, the length of which is inversely proportional to the wave-length and intensity of the ray. Those rays which have the property of exciting fluorescence are physiologically the most powerful. The Finsen lamp has a greater penetrating power than the ultra-violet lamp. Dr. J. M. H. McLeod describes experiments for increasing the reaction after Finsen treatment.

The liquids he found to be especially useful were (a) a 1-per-cent. solution of potassium permanganate, (b) a weak solution of iodine with glacial acetic acid, and (c) pure carbolic acid. According to Dr. G. G. S. Taylor, the application of pyrogallol greatly enhances the effect of Finzen treatment.

Frequent descriptions of cases of tubercular or cancerous skin diseases successfully treated by one of the several forms of therapeutic rays have appeared in the medical journals during the year. Among the most striking of these is a series of 50 cases reported by Dr. C. W. Allen (Medical Record, New York, Nov. 15, 1902, p. 762), Professor of Dermatology at the New York Post-Graduate Hospital. Of 33 epitheliomas and 10 mammary cancers, 52 per cent. were discharged as clinically cured, and 10 per cent. were still under treatment.

Smallpox.—The serious and wide-spread epidemic of smallpox which occurred last year on both sides of the Atlantic led to renewed discussion of compulsory vaccination and the methods by which the disease is spread.

In the section on State medicine at the last meeting of the British Medical Association the following resolution regarding vaccination was adopted:

That inasmuch as there is strong evidence to show that the effect of infant vaccination has very largely lost its effect after ten or twelve years, it is desirable that all children should be vaccinated at the age of twelve. The president expressed his opinion that compulsory vaccination was an absolute necessity, as the recent serious epidemics had demonstrated. "No one would object to the compulsory squelching of a man who persisted in haunting theaters and concert-halls with his pockets full of dynamite, yet many of those who refused to be vaccinated were quite as dangerous to the public."

The question of the aerial transmission of smallpox was again raised by a paper in the *Lancet* (London, Feb. 22, 1902) regarding the effect of the hospital ships anchored near the villages of Purfleet. The statistics given in this article seemed to indicate that those portions of the town over which the prevailing winds blew after passing across the ships suffered more severely from smallpox than other sections of the town.

While it is true that any contagious disease may be transmitted from person to person by an actual transference of material particles of contagium, and that wind may be, and undoubtedly is, in certain diseases—in tuberculosis, to cite a common example—the carrier of the morbid agent, the popular conception of the aerial transmission of a subtle gaseous poison, is entirely opposed to the results of modern research. The modern scientific view being that without an actual material transference of the poisonous agent there can be no infection.

A rather striking illustration of the value of vaccination has occurred during the last two years in Porto Rico. Soon after the Spaniards left the island in 1898 smallpox became epidemic, and by January, 1899, says Major Ames, the Director of Vaccination for Porto Rico, the disease had "honeycombed" the island, and in February "was spreading at a gallop." In February compulsory vaccination was begun. By July 1 860,000 vaccinations had been performed among a total population of 960,000. During the two and a half years since then the mortality has been 2 per year, against a previous smallpox death-rate of over 600.

Intraspinal Anesthesia.—Dr. H. Littlewood, F. R. C., surgeon at the Leeds General Infirmary, gives the following account of his experience with this method of anesthesia.

"I do not think that I have ever been more impressed in my life than I was with my first case, and I believe that all who saw the operation were equally impressed. It was difficult to realize that within a few minutes of introducing a third of a grain of cocaine into the spinal canal one could deliberately amputate through the knee-joint, the patient being conscious all the time, and yet not feeling any pain."

In all but one of Dr. Littlewood's cases "it acted admirably." This was a very nervous man who cried out apparently more from fear than pain. Among his cases were foot and leg amputations, and several "radical cures" for femoral and inguinal hernia.

The Germ of Syphilis.—Prof. Max Schüttler, whose work in connection with the cancer germ has been rather freely criticized, and who in 1900 stated that he had found certain characteristic bodies in the lesions of all stages of syphilis, publishes further researches on the subject in the *Centralblatt für Bakteriologie* (Nos. 5, 6, 7, 8, and 9, Bd. xxxii, 1902). In all his syphilitic preparations he has found certain capsulated bodies, some with protoplasmic contents, some empty, which he considers one stage in the life history of the parasite. Another peculiar form with a characteristically striated wall he thinks a young form of the germ. He states that he succeeded in cultivating this bacterium in closed flasks at 37° to 38° C. Inoculation experiments with the cultivated germ on rabbits seem to have been unsuccessful. Prof. Schüttler considers the parasite as belonging to a class about which little is as yet known, but which, he thinks, includes the form already described by him as characteristic of cancer growth.

Examination of Blood.—During recent years the examination of the blood has come to be more or less of a routine operation in diagnostic work.

The four methods in general use are: (1) The estimation of the number of red and white corpuscles. (2) The examination of stained blood films. (3) The determination of the agglutinating power of the blood. (4) Its bacteriological examination.

In many diseases the information obtained from the use of one or more of these methods is of the utmost value, both in determining treatment and in prognosis.

Dr. William Savage, of Cardiff, calls attention in a recent issue of the *Lancet* (London, Sept. 27, 1902, p. 866) to an improved method for counting the white blood-corpuscles. It is based on that of Stengel.

The blood is collected by means of a Thoma-Zeiss small pipette, such as is ordinarily used in determining the red corpuscles (the pipette should always be filled up to the 1.0 mark). The blood is then diluted with some colored fluid, such as Toisson's solution, or Sherrington's fluid. The red corpuscles are first counted in the ordinary way. To count the leucocytes the eyepiece is drawn out until a diameter of the field of vision is just spanned by an exact number of squares; this number is called x —i. e., equals the number of squares which exactly stretch across a diameter of the field of vision. The ruled squares need no longer be taken into account. The number of leucocytes in any recorded number of fields of vision is now counted, care being taken that the fields do not in any

way overlap. The stained leucocytes can be readily distinguished from the red corpuscles. The average number of leucocytes in each field is then determined, and this is called y . The larger the number of fields of vision counted, the more accurate will be the result. If the blood has been diluted 100 times the number of leucocytes per cubic millimeter may be found by the following formula: $\frac{5.600000 y}{11 x^2}$.

X and y only have to be determined, and a simple calculation gives the result. "Such a formula is available for any microscope and for any eyepiece."

The Sleeping Sickness.—A curious disease of the brain variously called the "sleeping sickness," "sleeping dropsy," "negro lethargy," etc., has been occasionally mentioned by medical travelers in certain portions of Africa. But very little has been known regarding its causes and symptomatology, as owing to its comparative rarity it passed for a long time unnoticed by the modern pathologist.

A considerable increase during recent years in its ravages in the Uganda district, and on Princess island and the province of Angola, has finally led both England and Portugal to send out commissions for studying it. The report of the Portuguese commission, which worked on Princess island, is summarized in the following account:

The most remarkable symptom of the disease is fits of absolutely uncontrollable sleepiness. At first these can be partially overcome, but as the disease progresses they not only increase in frequency, but become so entirely irresistible that the patients fall asleep with their mouths full of food, or while drinking. The sleeping finally becomes almost continuous. It is not so deep, however, that the patients can not be aroused, even as the end approaches—it is almost always fatal—but they immediately fall asleep again. According to Dr. Patrick Manson, the onset of the disease is preceded by a lightening and reddening of the hair. The disease is almost entirely limited to negroes. In the early stages there seem to be no marked mental changes, but later there is nearly always great depression of mind. According to Dr. Manson, the disease as observed in the Congo is frequently attended by insanity. Usually, even up to the fatal day, the sufferer understands and answers questions when aroused, and shows signs of pleasure—one patient smiling when presented with a cigarette a few hours before his death. The memory seems to be but slightly impaired, but the will and power of concentration are markedly weakened almost from the start. The senses—sight, hearing, and taste—remain active to the last. Sometimes during the early stages of the disease, between the fits, instead of the usual depression there is excessive and noisy hilarity, every occurrence being an excuse for "boisterous guffawing."

A number of pathological bodily conditions were found in the various organs (for which see the report of the commission published in the London Lancet, Sept. 27, 1902, p. 885), but the most marked and constant changes were found in the brain.

The cephalo-rachidian fluid, a small amount of which is present in the ventricles of the brain and canal of the spinal cord in health, was always found to be considerably increased in quantity and slightly turbid, although not purulent. The increase of fluid was accompanied by inflammation of the membranes of the brain, vary-

ing much in extent and severity in the different cases, but always present to some extent.

Microscopic sections of the brain substance showed an infiltration with leucocytes.

Bacteria were of course suspected and searched for. In the vessels of the pia mater, in the cerebral and medullary capillaries, in the cephalo-rachidian fluid and in the brain substance itself there was constantly found a diplo-streptococcus, which measured from 1.5 μ to 2.0 μ in diameter. It was found very difficult to cultivate this coccus artificially, although a slight growth was obtained on a culture medium of ascitic fluid and meat broth in equal proportions. Guinea-pigs and pigeons were unaffected by inoculations with the coccus, but rabbits were somewhat sensitive, and it was fatal to mice.

The conclusion reached by the commission was that the disease is a form of meningo-encephalitis, and that treatment "will be difficult, but may be possible in the early stages."

At Princess island the exciting cause of the disease appears to be excessive labor, poor food, and bad sanitation. All negroes of either sex are liable to contract it, except those over forty years of age. From one of the cases examined some ground is given for believing it contagious. These people eat from the same bowl with their fingers, and lick the latter after each mouthful.

Nothing could be learned regarding the incubation period. The onset may be sudden and marked by furious delirium with homicidal tendencies, but it is commonly preceded by a period of general malaise, lack of appetite, and incapacity for work.

At a meeting of the pathological and microscopical section of the Liverpool Medical Institution on Nov. 13 Dr. W. B. Warrington stated that the stress of the disease falls upon the lymphatic system, and especially that of the central nervous system. His observations agreed with those of Dr. F. W. Mott and supported the toxin view.

Alcohol in the Human Body.—The Practitioner devotes its issue for November, 1902, to an exhaustive discussion of the alcohol question from the medical point of view. It has obtained the views of eminent English physicians—such men as Sir Samuel Wilkes, Sir Henry Thompson, Sir William Broadbent, Prof. G. Sims Woodhead, and J. Milne Bramwell. Regarding their personal use of alcohol, Sir Samuel Wilkes has been a teetotaler practically throughout his working life, Sir Henry Thompson found his health much improved after stopping the use of alcoholic beverages, and Prof. Sims Woodhead attributes his early success in athletics and his present ability to do a good day's work largely to total abstinence. James Edmunds, of the London Temperance Hospital, gives statistics that indicate a considerably longer life among the total abstainers than in the case of even the so-called moderate drinkers. The general opinion of three of the practitioners may be summed up in the statement that alcohol is a useful drug, but a dangerous beverage.

In a recent memoir on alcohol (sixth memoir of the eighth volume [1902] of the National Academy of Sciences) W. O. Atwater and F. G. Benedict first call attention to the fact that as alcohol contains no nitrogen, it can not build or repair tissue, and hence that its only food value must lie in its heat-producing qualities. This function may be fulfilled in two ways: First, indirectly by stimulating secretion and the digestion of other food, and, second, by its own oxidation. Alcohol as a food can only be com-

pared with the starches, sugars, and fats, and not at all with the nitrogen-containing foods, such as meat.

A series of experiments were conducted on 3 young healthy men, 2 of whom had always been abstainers. The alcohol was taken in small quantities—2½ ounces per day in 6 doses—equivalent to 6 ounces of whisky or a bottle of claret.

It is expressly stated by the authors that their conclusions have no bearing whatever on the effects of long-continued drinking, nor of the effect of alcohol drinking on the ability to do hard muscular work.

They found that over 98 per cent. of the ingested alcohol was oxidized (which means utilized) in the body. Compared with the ordinary food substances as heat-producers, the following figures were obtained:

SUBSTANCES.	Heat of combustion.	COEFFICIENT OF AVAILABILITY.	
		Of material.	Of energy.
Protein.....	Calories. 5.65	98 per cent.	70 per cent.
Fats.....	9.40	98 "	98 "
Carbohydrates (starches, etc.)	4.10	97 "	97 "
Alcohol.....	7.07	98 "	98 "

FUEL VALUES

SUBSTANCES.	REFERRED TO AVAILABLE ENERGY.		REFERRED TO AVAILABLE MATERIAL.	
	Per gram.	Per pound.	Per gram.	Per pound.
Protein.....	Calories. 4.4	2,000	Calories. 4.	1,800
Fats.....	9.4	4,280	9.4	4,040
Carbohydrates.....	4.1	1,880	4.	1,800
Alcohol.....	7.1	3,210	6.9	3,140

The proportions of food and the several kinds of nutrients digested and made available for use in the body were practically the same in the experiments with and those without alcohol in the greater with the alcohol diet than with the ordinary diet, but the difference was extremely small.

The potential energy of the alcohol was transformed into kinetic energy in the body as completely as that of the ordinary nutrients. The efficiency of alcohol in the protection of body fat from consumption was very evident. Its efficiency in protecting body protein was evident, but it was not fully equal in this respect to the isodynamic amounts of the ordinary nutrients. The results, however, were not the same with the different subjects. An increased excretion of nitrogen at first occurred in the men unaccustomed to the use of alcohol; this, however, disappeared in the course of five or six days.

"That a part of the potential energy of the alcohol was transformed into the kinetic energy of muscular work these experiments do not prove, though they make it highly probable. We repeat," say the authors in closing, "that there is a very essential difference between the transformation of the potential energy of alcohol into the kinetic energy of heat, or of either internal or external muscular work, and the usefulness or harmfulness of alcohol as a part of ordinary diet. Regarding this latter question, the experiments bring no more evidence than they do regarding the influence of alcohol upon the nervous system, or its general effect upon the health and welfare."

Surgery of the Heart.—Dr. H. M. Sherman, of San Francisco, has collected the records of 34 cases of surgical operations on the heart. Of these, 5 died on the operating-table from hemor-

rhage; 10 died soon after leaving the table; 6 died later from blood-poisoning; and 13 recovered. The ventricles, owing to their much thicker walls, may be more successfully sutured than the auricles. Sir Lander Brunton, as the result of experimental work on heart-wounds, suggests that it may be possible to treat mitral stenosis (a form of heart-disease caused by the gradual closing of the mitral valve) by surgical means.

Surgery, Bloodless.—Dr. Adolf Lorenz was born in a small town in northern Austria forty-nine years ago. His father was a watchmaker, and was poor. The son entered the University of Vienna in 1875; soon won an endowed scholarship, and with the aid of this and what he could make by tutoring managed to complete the course, and obtained his degree in medicine in 1880. He soon became clinical assistant to Dr. Albert, Professor of Surgery. His ambition was to become a general surgeon, but a special sensitiveness of his skin to the antiseptics that were then coming into use in surgery—carbolic acid and bichlorid of mercury—so seriously hampered him that he was obliged to stop his clinical work. Prof. Albert advised him to devote himself to orthopedic surgery, and to this he reluctantly turned. He is 5 feet 2 inches in height, and muscular in proportion.

ADOLF LORENZ.

Prof. Hoffa, a surgeon of Würzburg (since removed to Berlin) devised, about 1890, an operation for the cure of congenital hip dislocations, which now goes by his name. Dr. Lorenz, after operating according to Hoffa's method several times, modified and improved it by considerably reducing the cutting, and the operation became known as the Hoffa-Lorenz method. Dr. Lorenz performed this operation several hundred times in Vienna, and out of the experience thus gained came his so-called bloodless method. This he performed for the first time in 1892, on a little Viennese girl. It proved successful, and he used it in other cases, improving the technique on each occasion. The operation was first called to the attention of the profession at the twenty-fifth Congress of the German Association of Surgeons at Berlin in May, 1896. It was then generally conceded that a new and valuable principle of treatment had been discovered. Paci, an Italian surgeon, declares that he discovered and announced the same operation as early as 1888. But there is considerable difference between the two methods, although both are bloodless. The Paci operation is apparently much less thorough, and consequently less effective. The Lorenz operation was first performed in the United States about six years ago by Dr. George R. Elliott, a pupil of Prof. Lorenz, on a girl of five years, who presented a typical congenital dislocation of the right hip. Other American surgeons have since performed the operation in several cases, with varying success; and, in fact, it was tried unsuccessfully in the case of the Armour child before Dr. Lorenz was sent for. She had a double

congenital dislocation, both hips being deformed, and the Chicago surgeon's operation resulted, it is said, in curing but one joint. The hip-joint is formed by a hemispherical depression in the pelvic bone, called the acetabulum, and a round, ball-like protuberance from the upper end of the thigh bone, or femur, set almost at right angles to the shaft. This protuberance fits into the socket of the pelvic bone and forms what is known as a ball-and-socket joint. In congenital dislocation of the hip, either because of some imperfection in the ball or in the socket, or through a prenatal accident, the ball and the socket are separated, and because of the arrangement of the muscles surrounding the socket, the head of the femur is displaced upward, usually either backward or forward. The object of the Lorenz operation is to replace the ball in the socket and hold it there until the joint has recovered its power sufficiently to retain the correct position without the use of the knife. After the dislocation has existed for some time the surrounding muscles become contracted, and great force is required to stretch or tear them sufficiently to permit the ball to drop back into its socket. Hence the essential part of the operation consists in stretching and tearing the muscles until they are limp and functionless. This is accomplished by Dr. Lorenz in the following manner: An anesthetic is given; an assistant then firmly holds the pelvis of the child, while the doctor raises the leg forward and upward until the foot is carried to the shoulder; this is done gradually, the muscles meantime being kneaded and massaged, especially at the points where they are fastened to the bone. The child is now turned on its face, and the same extreme stretching produced in the opposite set of muscles by carrying the leg backward and upward. The leg is drawn away from its fellow—abducted, as it is called—and the inner thigh muscles thus stretched and torn. These movements are continued until the muscles about the thigh are all quite flaccid. The skin is usually considerably bruised during this operation. The femur is now drawn down until the ball is opposite the socket, and then manipulated until it drops into the latter. Dr. Lorenz is thus quoted regarding the sensations produced by the curious click that is heard when this occurs: "The event, always expected with great tension of mind and deep longing, is accomplished like the triumphal entrance of a princely lord through the doors of his hereditary residence, from which he has been excluded for a long time through stress of circumstances, amid the chiming of bells, the beating of drums, and the firing of cannon which shakes the foundation of his castle. And yet this plaintive music of nature is for the parched ears of the operator a sound-intoxicating song of the spheres; as long at least as he preserves, during his laborious work, a receptive soul for such enjoyment."

Owing to the flaccid, rag-like condition of the muscles, the newly formed joint is not stable, so that a redislocation is very apt to occur. In order to prevent this, the leg is drawn out sideways so that it rests at an angle of 90 degrees with the body, and maintained in this position by a plaster cast. The pains due to the operation subside in a few days, and the child is then encouraged to walk about and play. Dr. Lorenz lays great stress on the early use of the limb, holding that the pressure of the head of the femur in the acetabulum, caused by the weight of the body, is an important element in causing the reformation of a useful and efficient joint.

In his earlier operations mechanical contri-

vances were used for stretching the leg and drawing down the femur, but these are now rarely required by Dr. Lorenz, although it is probable that the surgeon of average strength will have to resort to them much more frequently. He now leaves the plaster cast in place for six months to two years; his early practise was to remove it after three months, and, if necessary, put on another. He holds that a cure is obtained in about 60 per cent. of his cases, and an improvement in nearly all. It is said by other surgeons that the cutting operation is equally successful.

Dr. Lorenz has applied the same bloodless methods to the treatment of other joint and bone deformities, and even to wryneck. Stiffened knees and clubfoot are corrected by the intra-articular modeling *redressement*, as he calls his powerful massage, and the shortened (sternocleidomastoid) muscle in cases of wryneck is torn apart and stretched instead of cut, as by the old method.

One of his principles is to save the bone, even at the expense of the soft parts. He believes that efforts should always be made to cause the patient's own anatomical apparatus to correct a deformity, or a tendency thereto, whenever possible, rather than to clothe him in a suit of mail or a cage of steel rods. In chronic joint disease he uses as little apparatus as possible, and discards it early.

The Lorenz bloodless operation is by no means entirely free from danger. Among the few patients operated on in Chicago there was one case of fracture of the femur, another in which an extensive blood tumor formed, and a third in which severe tearing of the perineum occurred.

METALLURGY. General.—In a lecture on the Relations between Metallurgy and Engineering, delivered before the Institute of Civil Engineers, Sir W. C. Roberts-Austen pointed out that when metallurgists gave engineers mild steel they provided a carbon-free solid solution of iron and carbon. All subsequent advance had been due to recognition of this fact and to the profound studies of metallic solid solutions. Sir John Hawkshaw had said that if the strength of iron could be doubled the advantages might be equal to the discovery of a new metal more valuable than iron ever had been. The lecturer believed that this was exactly what metallurgists had done with regard to steel. By suitable thermal treatment and by suitable addition of comparatively rare metals they had doubled the strength of steel as it was made in the early days. Having explained the nature of solid solutions, the lecturer dwelt upon the importance of allotropic modifications of iron, and cited evidence of the possibility of the past molecular history of a mass of steel being traced by microscopic examination of the metal. It was demonstrated that solid metals might reveal, by their structure, the vibrations to which they had been subjected. With regard to the efforts metallurgists were making to study the influence of rare metals on iron and other metals, the reducing power of aluminum on metallic oxides was shown. The need for the careful measurement of high temperatures in connection with the treatment of large masses of metal was illustrated by reference to the new Alexander III Bridge in Paris. In the construction of this bridge 2,200 tons of cast steel had been employed, and a peculiar molecular structure was imparted to this steel by rapidly cooling it in air from a temperature of 1,000° C. to 600° C. This gave the metal certain mechanical properties which it would not otherwise have possessed. The use of copper, aluminum, and other metals in

electrical engineering was referred to, and the lecture ended with an appeal for the more extended study of the physical properties of metals.

The report of the committee of the Iron and Steel Institute which was appointed to ascertain whether it would not be possible to make the terminology of metallography less complicated and more precise comprises a glossary of the more important terms used by authors of memoirs dealing with the subject, with the exact equivalents in French and German. Care was taken in performing the work to exclude controversial matters, and when a definition was not universally accepted to quote the definition given by the specific author.

The investigations of Prof. J. O. Arnold and Mr. Andrew McWilliam on the composition of steels were confined to pure iron and carbon steels such as are produced in the best crucible practise. The authors reached the conclusions that the clear and definite constituents of hardened steel are (a) hardenite, Fe_3C , of which the whole mass consists only in the case of 0.89 per cent. carbon steel; (b) ferrite, Fe , which segregates more or less in unsaturated carbon steels in spite of the rapid action of quenching; and (c) cementite, which segregates more or less in saturated steels in spite of the rapid action of quenching. The indefinite portions of the hardened steels consist in unsaturated carbon steels of hardenite containing more or less unsegregated ferrite, or in supersaturated carbon steels of hardenite containing more or less unsegregated cementite. Martensite is not a constituent, but a crystalline structure developed at high temperatures. It is marked in saturated carbon steels by preferential etching lines; in unsaturated carbon steels by striæ of ferrite; and in supersaturated carbon steels by striæ of cementite. The existence of the constituents sorbite, troosite, and Austenite is extremely doubtful. Students should guard against apparent or false constituents really due to optical causes or to obscure polishing or etching effects. The views expressed by the author were opposed on the reading of their paper at the meeting of the Iron and Steel Institute by Sir W. C. Roberts-Austen, Mr. J. E. Stead, and others.

Iron and Steel.—The first paper read at the summer meeting of the Iron and Steel Institute, at Düsseldorf, Germany, was by Mr. W. Brüggemann, of Dortmund, and showed that almost all of the increase in the world's production of pig-iron from 18,300,000 tons in 1880 to 39,000,000 in 1901 had been shared by Germany and the United States, the weight of pig-iron made in America in 1901 having been more than three and a half times what it was in 1880, and that of Germany more than three times greater. The large increase in the German production was ascribed by the author to the development of coal-mining, which had made available a good supply of native fuel, and to the opening up of the iron deposits of Luxemburg and Lorraine, by which a supply of native ores suitable for the basic process of steel-making had been placed at the disposal of the manufacturer. The dephosphorization of iron in the converter exercised the most important influence in the rise of the German iron industry. While the make of basic pig-iron had developed to be more than 4,800,000 tons, or 2,000,000 tons more than the total iron production of 1880, and the make of foundry pig-iron had also increased from 200,000 tons in 1880 to 1,500,000 tons in 1900, the manufacture of puddling-iron and spiegel had declined from about 2,000,000 tons to 1,800,000 tons. The reduction in wrought-iron is regarded as no more than the inevitable consequence of the

advance in steel. Notwithstanding the development of the German iron industry, the blast-furnaces of the land have not been able to meet the demand. The author spoke of the excellent equipment of the German iron-works, and said that their appliances had to a large extent been based on those of American works, but were not mere copies of them. Among special features of German iron-making practise spoken of were the recovery of by-products from gases evolved in coke-making, improvements in mechanical appliances, the extensive adoption of the practise of carrying iron in the liquid state from the blast-furnace to the steel-works, the increasing utilization of blast-furnace gas, and the application of surplus power to the manufacture of cement from blast-furnace slag.

Mr. Axel Wahlberg, reviewing Brinell's researches into the influence of chemical composition on the soundness of steel ingots, maintained that the percentage of carbon and the casting temperature, which had hitherto been considered the agents responsible for the presence and position of blow-holes, were to be regarded as exercising a secondary influence. The principal cause of the defect was the presence of manganese and sometimes of aluminum contained in the ingot metal at the moment of casting.

In a paper on the Properties of Carbon in the Hearth of the Blast-Furnace, read before the Iron and Steel Institute, Mr. W. J. Foster showed that by increasing the temperature and diameter of the hearth more carbon would be exposed to the oxids, with proportionally less interruption by the gases that are decomposed in the neighborhood of the tuyères; hence more carbon would be converted into carbon monoxid in the hearth per unit of air introduced at the tuyères, and consequently an increased rate of driving would result.

In a paper on the overheating of low-carbon mild steel, Prof. Heyn, of Berlin, submitted as his principal conclusions that when low-carbon mild steel is annealed at temperatures above $1,000^\circ \text{C}$. there is an increase in the degree of brittleness, if the annealing process is sufficiently long. This increase is more considerable and manifests itself the sooner the higher the temperature of annealing. Prolonged annealing, say uninterrupted for fourteen days at temperatures between 700° and 890°C ., produces no increase in brittleness. In such cases, where the brittleness of the material in its initial state was not yet at the lowest degree possible, that degree is attained by this treatment. Between $1,100^\circ$ and 900°C . there exists a temperature limit, above which, if annealing is carried on for a longer period and at an increasing temperature, the degree of brittleness increases. Below this limit, however, such is not the case. Overheating does not occur at most extreme white heat, but manifests itself at considerably lower temperatures, which must, however, exceed the temperature limit just referred to. By suitable annealing, the brittleness of overheated low-carbon mild steel can be eliminated. If annealing is carried on above 600°C ., a short period of about half an hour is sufficient. Longer annealing must be the more carefully avoided the more the temperature limit between $1,100^\circ$ and 900°C . is exceeded, otherwise the signs of overheating will reappear. Below 800°C . an annealing of even five hours is not enough to eliminate the brittleness in the overheated metal; but by annealing of one day's duration at temperatures between 700° and 850°C . this object can be attained. If low-carbon mild steel which has been annealed for a longer period at a high enough temperature, so that after undisturbed cooling it

would show extreme brittleness, is rolled or forged during cooling to bright-red heat it will exhibit no brittleness when cold. The fracture of the overheated steel generally shows a coarse grain, although this is not necessarily always the case. The single crystal grains of which the structure of the iron is built up, which can be detected under the microscope by suitable etching, are often of considerable dimensions when in the state of overheating. Nevertheless, this is not to be considered as proof positive that overheating has taken place, since the method of cooling also exercises a great influence over the size of the ferrite grains. Rapid cooling from the temperature causing overheating produces fine ferrite grains, without reducing the brittleness appreciably. Moreover, it is possible, by heating low-carbon mild steel for days together at between 700° and 890° C., to bring the material into such a condition that it will show exceedingly coarse ferrite grains, and yet not exhibit brittleness.

A new method of compressing steel during solidification and while still liquid in the ingot mold, which the author called "wiredrawing," is described by M. A. Harmet. When molten steel is poured into the ingot mold it may suffer various changes in character, being subject to contraction, crystallization, and liquation, with injurious effects upon its qualities. When the metal begins to cool, it shrinks from the walls of the mold, a solid steel shell is formed, enclosing liquid, and this continuing to cool, shrinks, becomes plastic, and attaches itself progressively to the shell, leaving a hollow corresponding to the shrinkage, and extending along the axis of the upper part of the ingot. The lower central part of the ingot also has porosities and tiny cracks, and fissures may be detected by the microscope pervading the whole mass. Injurious stresses are set up, crystals are formed having little cohesion between themselves, whereby the liability to crack is increased, and the metalloids that enter into the composition of the steel have a tendency to separate from the iron by liquation. The ingot, as cast, may therefore be useless, and require mechanical treatment to remedy its defects. The author's method is intended to effect compression on the steel while it is in the mold. Pressure is applied by means of a hydraulic press to the bottom of the ingot while it is liquid in the mold. Owing to the form of the modern ingot mold, tapering toward the top, the upper diameter is less than that of the lower part. By applying pressure from below, the ingot, which has shrunk on cooling, is thrust upward into the smaller part of the conical mold. The cooled shell thus presses on the central part, and the hollows due to shrinkage are not free to form. By hastening the solidification in this way the tendency to coarse crystallization is counteracted, and the tendency of carbon to accumulate in the part of the ingot where solidification last takes place is lessened. The process is called wiredrawing because of a supposed similarity between the pressing of the metal into the upper part of the mold to forcing it through a draw-plate. Advantages are claimed for this method over that of Sir Joseph Whitworth, who applied pressure from the top, in that the pressure as applied by him is more effective and thorough. The author represents that with it production is increased 25 per cent.

In the Blau-Thiel process as described by Mr. J. W. Cabot, the fluid iron from the blast-furnace was charged in the refiner with 7 per cent. of quicklime; 10 per cent. of ore was added, and then a second ladle of iron. The charge was

made of 15 tons. The pig-iron contained 3.70 per cent. carbon, 1.35 phosphorus, 0.90 silicon, 0.40 manganese, and 0.05 sulfur. After boiling in the refiner two hours, 90 per cent. of the phosphorus and 95 per cent. of the silicon had been removed, while more than two-thirds of the carbon remained. The finishing furnace, containing 3½ per cent. of lump lime, 7 per cent. of ore, and 7 per cent. of scrap, having been brought up to heat, the refined metal was tapped into it after the slag had been skimmed off. After boiling two and a half hours the phosphorus was brought down to 0.01, and the bath was ready for tapping.

The belief that the percentage of graphite in iron is independent of the amount of silicon present is attributed by H. M. Howe to a wrong interpretation of the evidence. Mr. Howe shows that the graphite content in normal and relatively pure commercial pig-iron is influenced only indirectly by the percentage of silicon, in that silicon lowers the solvent power of iron for carbon, and thus lessens the proportion of combined carbon and increases that of graphite, provided the total carbon remains constant; the decrease of combined carbon is rapid at first, especially as the silicon rises from zero to 0.75 per cent., and then becomes slower and slower. The influence of silicon is often masked by that of the variables. Sulfur is known to raise the saturation point of cast iron for carbon; by increasing the combined carbon content it lowers the graphite content. It is estimated that the proportion of combined carbon in pig-iron is increased 0.02 per cent. for each 0.01 per cent. increase in sulfur when the iron contains from 1 to 2 per cent. of silicon, and 0.03 per cent. for each 0.01 per cent. of sulfur when the iron contains from 2 to 3 per cent. of silicon.

In well-equipped foundries, the cinder from the cupola is usually crushed in a tumbler and the shot separated from the pulverized cinder. C. H. Putnam further passes the pulverized cinder over a magnetic separator, and thus saves additional iron, recovering daily from the dump of two cupolas 550 pounds of siftings, which give 450 pounds of strongly mottled iron after melting. This iron is to be worked in with the regular cupola charge, in amounts to be found by experiment. The daily saving by the combined crushing and magnetic separation with two cupolas amounts to \$3.

By the Giebler process of hardening steel it is claimed that all sorts of iron can be given strength and hardness double that obtained by the Harvey, Krupp, and Boehler processes, while the cost of production is reduced 50 per cent. Experiments made with it at the Technical High School, Charlottenburg, Prussia, were very satisfactory.

The objections have been made to the new methods of rail production that the rail made by them is so low in carbon and has so soft a head that the wear makes them useless in a much shorter time than the older rails of lighter section. It is claimed that these difficulties are obviated in the Copen process, by which a rail is produced with a hard, tough face and free from scale and strain, showing a finer grain of steel in the head, and having from a third to a half superior durability to the usual rail.

Lieut.-Col. Davis, of the Naval Ordnance Bureau of the United States, has produced an armor-plate which, when tested at the proving-grounds at Bethlehem, gave results encouraging the belief that the armor-plate has again overtaken the gun in the struggle for supremacy. This plate is obtained by a novel process, carbon being driven directly into the surface of the hot metal by an

intensely powerful current of electricity, the result being a face as hard as glass and of any thickness desired, supported by a tough back, which, it is claimed, can not be cracked. The depth of the hardening is regulated by the length of time the current plays upon the plate. It is claimed that an average plate can be completely treated electrically in five hours. Moreover, it is asserted that the plate is a third lighter for the same resisting power.

Among the advantages offered by nickel-steel, R. S. Tappender mentions the smaller liability, arising from its greater tension, of fractures when started to extend, than exists in common steel or iron. The elastic limit of nickel-steel is also much higher in proportion to its tensile strength than that of steel or iron.

Not many brands of hard tool steel can be used with advantage and economy for the preparation of the various cutting tools employed in the machinery of modern armor-plates. A steel prepared by Sergius Kern, of St. Petersburg, has the following composition:

Tungsten.....	2.00 per cent.
Molybdenum.....	0.50 "
Carbon.....	0.90 "
Manganese.....	0.20 "
Silicon.....	0.18 "

The phosphorus and sulfur must be kept down as low as possible, on the average not more than 0.03 per cent. of the combined elements, of which not more than 0.01 per cent. should be sulfur. The steel is, and must be, prepared by the crucible process. Such a self-hardening tool steel is very convenient for the machining of hard metals.

A paper on the probable existence of a new carbide of iron, Fe_3C , was communicated by Prof. E. D. Campbell and Mr. M. B. Kennedy, of the University of Michigan, to the Iron and Steel Institute at its summer meeting in Düsseldorf.

Titanium.—In illustration of the importance of the metallurgy of titanium, Mr. Augustin J. Rossi, in the *Journal of the Franklin Institute*, refers to the extent of the deposits of iron ores containing a notable amount of titanic acid which occur all over the world in immense quantity, especially in the formations of Sweden, Norway, Canada, North Carolina, and other regions, and the Adirondacks. As a rule, these ores are Bessemer ores, usually free from phosphorus and sulfur, though not invariably so. It is obvious that if these ores were to be regarded in the same light as other ores equally rich in iron, they might form an excellent stock for blast-furnaces for years to come, as their supply might be called inexhaustible. The objections that have been alleged against the use of these ores are characterized by the author as unreliable, contradictory, and contrary to the facts. Mr. Rossi's own experiments and other evidence are cited to show that instead of the presence of titanic acid in blast-furnace slag rendering it infusible, such slags are worked without difficulty from that cause. An objection based upon relative economy of production is declared not valid, because of the better quality and higher value of the pig produced from the titaniferous ores. A general consensus of opinion is alleged to the effect that the pig smelted from really titaniferous ores, whether smelted alone or in important proportions, with other ores, is strong, "wonderfully good," "a splendid iron," "all that can be desired," etc. The addition of from 10 to 15 per cent. of titaniferous pig to a cheap grade of foundry pig raised the tensile and transverse strength, with a deeper chill, and at a cost of several dollars less per ton.

This titaniferous pig does not, however, contain titanium to any important extent. The influence of that element in the smelting seems to be more one of purification, eliminating obnoxious elements, than a direct one. The author has experimented with alloys of titanium and iron, and has found that as the percentage of titanium increases the fusibility diminishes. All the alloys, both with carbon and those free from it, are much lighter than cast iron, their specific gravities varying with the amount of titanium. Added to steel, titanium increased the ductility considerably. It has been suggested that titanium may have an indirect action besides its specific one, when added to steel—acting not only as a deoxidizing agent, but also by removing from the steel the nitrogen which is undoubtedly present in it, and which has an unfavorable influence on its strength, titanium burning in nitrogen at 300°C ., with incandescence, as iron burns in oxygen. If such be the case, the use of the titanium alloy, even when containing carbon, would be well indicated, since the titaniferous ore could be used as a recarbonizer on account of the high percentage of carbon it contains, as a deoxidizer (with or without ferro-manganese), and perhaps as a denitrogenizer; and since, in the case of smaller converters for steel castings, the heat of formation of titanic acid, which is much higher than that of silica, would prove advantageous in raising the temperature of the bath, even were but a small percentage of titanium to remain ultimately in the finished product, there would seem to be, with suitable adaptations of open-hearth furnaces, a promise of the opening for these titanium alloys of a large field of usefulness and for the titaniferous ores a very important application.

Gold, Silver, Platinum, and Mercury.—The oxidized gold ores of the Lydenburg district, Transvaal, are composed of quartz, oxides of iron, and dolomite, and contain, besides the gold, small quantities of manganese, bismuth, silica, and copper. In the cyanid treatment of these ores, manganese dissolves only when an insufficient amount of lime is used, bismuth presents no difficulties, and 10 per cent. or less of silver is recovered. Copper is present in different forms to the extent of 0.4 per cent., and collects in the metallic form on the amalgamating plates, while a small proportion is dissolved by the cyanid, with formation of potassium cuprocyanid, 3KCyCuCy . The method of removing the copper is to heat the ore with the cyanid solution obtained in ordinary practice, containing cuprocyanid, but no free cyanid. This solution would dissolve the copper, and, after having been freed from it again by the Siemens-Halske electrolytic method of precipitation, could be used over again.

In pyritic smelting or smelting of dry silver ores in connection with pyrites to form a matte, F. R. Carpenter, dealing with ores of the silicious gold belt near Deadwood, S. Dak., successfully followed the general work of Mansfeld, Germany. The matte fall rarely exceeded 5 per cent. Iron sows formed in the operation, and helped to carry down the gold, so that clear slags could be made in the absence of copper, which has heretofore been deemed essential to the production of waste slags free from precious metal. The refining of the matte was at first accomplished by treating with lead ores; then it was found that matte as well as iron sows readily gave up the gold to the lead, while the extraction with silver was not so perfect. In a second method described by the author the matte was smelted for cop-

per bottoms, which being granulated, oxidized, and resmelted with sulfur-bearing material, gave a second bottom very much richer than the first. The presence of some lead is essential to obtaining a perfect concentration. Six parts of lead to one of copper give satisfactory results; but the bottom from the second selecting was so rich in lead that it could be expelled, often directly, without any addition of that substance. The first bottoms could be resmelted directly with sulfur-bearing material without granulating and oxidizing; and the operation could be repeated until the concentration had reached the desired degree. The author also found this method satisfactory in smelting Cripple Creek ores in Colorado.

Platinum is a metal of great value to the chemist and the artisan on account of its melting only at an extremely high temperature and its resistance to the action of all acids except the nitrohydrochloric. It is largely used in chemical processes, in the forms of crucibles, dishes, spoons, spatulas, foil, and wire. Its coefficient of expansion being nearly the same as that of glass, it has been largely employed in the construction of incandescent electric lamps for connecting the outside copper wire with the carbon filament. It is used in the manufacture of the contact points of telegraph-keys, in the pins for attaching artificial teeth to the plate, in stills for the concentration of crude sulfuric acid, when it is alloyed with about 3 per cent. of iridium; to some extent in jewelry; in the manufacture of platinotype paper for printing photographs; in the construction of fine weights for chemists' balances, for surgical and other scientific instruments, for making balance-wheels and hair-springs of non-magnetic watches, for obtaining a silver color on porcelain, for producing what is called "oxidized silver," and for the fuses of electrically exploding dynamite cartridges. Although platinum has been supposed for many years to exist in New South Wales, its actual discovery there in paying quantities dates only from 1893. The amounts at present obtained are limited, the chief difficulty in the way of production being the scarcity of water in the districts where it occurs. It is found in the native state alloyed with iron, iridium, osmium, and other rare metals. It usually occurs in grains or scales, sometimes in irregular lumps or nuggets, and rarely in crystals. In the Fifield district, about 322 miles west of Sydney, it is associated with gold, the metals occurring in fairly coarse water-worn grains, confined as a rule to the cavities of the bed-rock, and to the wash-dirt for a few inches above it. As compact platinum does not amalgamate with mercury in the cold, it can easily be separated from gold by means of that agent. Platinum is also found in the beaches of the northern coast of the state of New South Wales, where it is obtained from the auriferous sands. Here the gold, platinum, etc., which are concentrated on the beaches during stormy weather are brought down by the action of the waves from an ancient beach deposit which occurs at an elevation of about 6 feet, and which has locally received the name of "black rock." The only other form than those mentioned above in which platinum is found is that of an arsenide, in the mineral sperrylite, which occurs in minute cubic or cubo-octohedral crystals having a tin-white color and a black streak.

In the treatment of cinnabar ores at the works of the Marfa and Mariposa Mining Company, Brewster County, Texas, as described by E. B. Spalding, the crushed ore is charged hourly by a

car holding 900 pounds, and every half-hour half a car of spent ore is withdrawn below. It takes the ore about twenty-four hours to pass through the furnace. The fumes leaving the furnace by a 16-inch sheet-iron pipe, zigzag through 6 condensers, each with a partition wall before they pass through a long flue into the air. The condensers are dry on account of the scarcity of water. Most of the quicksilver collects in the first three chambers, which are freed from soot weekly, while the other three have to be cleaned only once a month. The condensed quicksilver runs off continuously into a storage-tank to be bottled. The soot is freed from a large part of its quicksilver by working on an inclined plane, where it is added in small amounts to the ore charge. The yield in quicksilver is estimated to be 90 per cent. In five months 1,200 flasks of quicksilver were produced.

Aluminum.—A purity is said by W. Murray Morrison to be attained now in electrolytic aluminum of 99.5 and 99.6 per cent., the impurities being 0.25 per cent. of iron and 0.17 per cent. of silicon. Another example analyzed by Prof. E. Wilson gave 0.31 per cent. of iron and 0.14 per cent. of silicon. Such a standard of purity has been only gradually obtained. The importance of purity is insisted upon by the author in his paper in the *Journal of the Institute of Electrical Engineers*, since impurity affects the value of the metal as an electric conductor in two ways: by lowering the conductivity and by increasing the liability to atmospheric corrosion. The evidence is somewhat conflicting as to the power of aluminum to withstand atmospheric influences; but on the whole the metal seems fairly satisfactory in this respect. The thin film of oxid which immediately forms on its surface in air acts as a protective coating. The usefulness of aluminum in metallurgy, of which much has already been said in previous volumes of the *Annual Cyclopædia*, is continually becoming more apparent and better appreciated. Of the part it plays in this field, Mr. Morrison speaks of the improvement secured to the finished product through the addition of a small quantity of aluminum (from 2 to 5 pounds per ton) in the casting of steel, iron, brass, and other metals, when the aluminum combines with the occluded gases, with the effect of reducing the blow-holes and rendering the metal which is being cast more fluid and ultimately more homogeneous. Much is expected from the application of Dr. Goldschmidt's use of aluminum for producing high temperatures to the welding of rails, pipes, etc. (noticed in the *Annual Cyclopædia* for 1901), which has not yet become of commercial importance. By virtue of the low specific gravity of aluminum it is used in cases in which weight is a drawback—in naval and military equipments, motor-car construction, and like applications—in which the metal finds considerable and increasing employment. For cooking utensils, for which it is eminently suited, its use is steadily increasing. The chief drawback to the general use of aluminum is its low tensile strength. This may be improved to some extent by alloying with a small quantity—less than 10 per cent.—of nickel or copper. A table has been prepared by Prof. Wilson incorporating data with reference to some of these light alloys. Substituted for copper in electric conductors aluminum allows wider spans; but when insulated cables are wanted for low-tension work, the increased diameter of aluminum conductors involves increased cost in insulating material. In lead-covered cables, the increased weight of lead would almost, if not quite cancel the de-

crease in weight caused by substituting aluminum for copper. For high-tension cables, aluminum may possibly be in some cases cheaper than copper. The author suggests that since the cost of power required for the electrolytic conduction of aluminum is higher than that of any other electrolytic manufacture, it will be advantageous to use water-power.

Mr. W. H. Preece has observed that when aluminum wires break, they give way at points where impurities exist; and for that reason, he remarks, it is satisfactory that the purity of the metal has been increased by recent processes.

It is shown by Prof. T. W. Richards that in the classification of alloys of aluminum the useful ones fall into two groups—those in which small amounts of another metal are present with aluminum, and those in which aluminum is added in small amounts to other metals. Generally speaking, according to William Campbell and John Mathews, the metal present in the smaller amount should not exceed 15 per cent.; and in alloys of the first class much smaller proportions give the maximum improvement in the alloy, hardness being one of the qualities most sought. Aluminum seems to be able to take up considerable quantities of certain metals without undergoing change of volume, though the density and probably the hardness are improved in such cases. Aluminum seems to form intermetallic compounds more readily than any other single metal, unless it be the metals of the alkalis. On the other hand, there are several metals with which it will not combine or even mix to give homogeneous alloys except when the added metal is present in very small quantities. Among the metals of this class, lead, bismuth, and cadmium may be mentioned.

Specimens of alloys of aluminum in the form of wire 0.126 inch in diameter were placed by Prof. E. Wilson on the roof of King's College, London, where they remained about thirteen months, in order to investigate the effect of exposure to a London atmosphere. The percentage of variation of specific resistance had a somewhat wide range, according to the conditions. Corrosion increased with the percentage of copper. Nickel alloyed with copper had the effect of slightly increasing conductivity during exposure. The conclusion was reached that copper alone should not be used in light aluminum alloys. The presence of equal amounts (about 1 per cent.) of nickel and copper certainly reduced conductivity to a small extent, but the gain in mechanical and non-corrosive properties was great.

From tests made at the Zurich Polytechnic Institute of aluminum bronzes furnished by the Neuhausen Aluminum Company, it is found that the specific gravity of the metal first rises and then falls, as the percentage of aluminum increases. The maximum strength for soft alloys was obtained with 3.4 per cent. of aluminum, and for hard alloys with 1.4 per cent. of that metal. For brass, the elasticity decreases with the increase of aluminum, and is extremely low with 2 per cent. of it. Iron in the proportion in which it is present in the alloys was not observed to influence sensibly the physical characteristics. Aluminum bronze containing 10 per cent. of aluminum with 1.5 per cent. of silicon and iron is too brittle to be of any practical value. As regards abrasion by friction, the hard alloys, with less than 89.6 per cent. of copper, lose little in weight, while the soft alloys, with less than 6 per cent. of aluminum, heat and wear away rapidly.

The addition of a small quantity of aluminum

has been found by E. S. Sperry advantageous in the manufacture of German silver. It greatly improves the qualities of the alloy, causing it to fill the molds completely and entirely preventing the formation of blow-holes. Less than 0.05 per cent. of aluminum is required to impart this quality. The addition of larger proportions, as from 3 to 3.5 per cent., gives the metal qualities that make it more like tempered steel than any other of the non-corrosive alloys. Hard and stiff bars can be worked and machined. As the best formula for this hard alloy, Mr. Sperry gives: Copper 57, nickel 20, zinc 20, and aluminum 3 to 3.5, according to the stiffness required.

Tin.—In the process of Paul Bergsøe for the electrolytic recovery of tin from scrap and waste alloys, the tin-bearing materials are reacted upon by stannic chloride, and the stannous salts formed are subjected to electrolytic treatment. In theory the process is identical with the Hoepfner process for extracting copper, which depends upon the varying valences of the metal. This process consists in bringing a salt of copper in a higher state of oxidation into contact with the ore, whereupon copper passes into solution and the solvent is reduced from the cupric to the cuprous condition. This solution is then electrolyzed with insoluble anodes, whereby it is caused to deposit one-half of its metal, with restoration of its valence and solvent power and recovery of an amount of metal equivalent to that dissolved. The Hoepfner process has encountered in practice the very serious obstacle of a low reaction velocity—a solvent action so slow as to render its application to the most commonly occurring ores of copper, the sulfides, of doubtful practicability. From this defect the tin process is free, for the stannic salts are energetic solvents. The successful treatment of tin scrap, however, has proved in the past a difficult problem, on account of its very low tin content and because of the tendency of the iron to pass with the tin into solution. The industrial value of the new process as applied to this purpose is therefore yet to be investigated.

Two electrolytic processes for the recovery of tin from tin scrap as carried out in work in Germany are described in an anonymous article in the *Zeitschrift für Electrochimie*, both of which are based on the use of scrap as anode material. In one the bath contains sodium chloride and hydrate; in the other, hydrochloric acid. It is an advantage of the former method that less iron gets into the solution; but, on the other hand, the energy efficiency of the process is lower, and when it is used, the deposit obtained at the cathode is more spongy. The failure to get metallic tin directly is a disadvantage of both processes. The metal can, however, according to the article, be obtained in the electrolytic bath under certain conditions. Pfenhauser has suggested that avoidance of the formation of sponge may be simply a question of maintaining the concentration of the tin-salt solution near the cathode—a condition which appears to be difficult in works treating tin-scrap on an industrial scale. The problem of producing metallic tin at the cathode is complicated further by the slow, gradual increase of impurities in the electrolyte. Of several works that have been built in Germany for carrying out the electrolytic process, the largest is that of Goldschmidt at Essen, where from 50 to 60 tons of tin-scrap are treated per day. Other works have been or are being built in Austria and Germany, and a company was formed in England in 1901 to operate an electrolytic works.

In the Gelshart process for the electrical separation of pure tin from waste tin cuttings, the tin is recovered by electrolysis, and the cleansed iron is sold as best scrap or is converted into green copperas, which may be further converted into red oxid or Nordhausen sulfuric acid. The electrolyte in the stripping tanks is a 14-per-cent. solution of commercial hydrochloric acid, to which is added a small quantity of oil of vitriol.

Copper, Zinc, Nickel.—In poling copper Mr. E. S. Sperry leaves the reduction of cuprous oxid uncompleted, in order that the traces of bismuth, arsenic, and antimony in the copper remaining shall be present as oxids, where they are less harmful than as metals. Small amounts of cuprous oxid are liable to make copper somewhat cold-short, but not hot-short; hence the metal is rough rolled hot and finished cold. In making brass, some of the zinc is oxidized at the expense of the metallic oxids contained in the copper. In experiments made to see what effect the oxygen of the copper had in brass-making the copper used was oxidized by exposing it in a melted condition to the air. Analysis gave from 1.2 to 1.52 per cent. of oxygen. Oxidation with niter proved unsuccessful. The base composition of the brass used was copper 60 per cent. and zinc 40 per cent. The experiments showed that the amounts of oxygen usually contained in economical copper (from 0.010 to 0.012 per cent.) have no harmful effect on the quality of brass intended for rolling into sheets; the oxygen may reach even 0.55 per cent. and do no harm if specific care be taken. An excessive amount of oxygen causes the formation of a salamander, a mixture of infusible zinc oxid and copper. If oxygen is present in not sufficient amount to form a salamander, but in the proportion of about 0.55 per cent., the brass will show a tendency to crack, owing to the presence of zinc oxid.

In a process for copper-matte concentration described by Thofelm and St. Seine (Oesterreiche Zeitschrift), a mixture of air, superheated steam, and silica is blown upon a bath of molten matte or crude metal in a reverberatory furnace. A rapid oxidation and scorification of the metals to be removed take place in the zone of action of the tuyères without any mingling of the slag with the bath, the action of the blast being to drive the slag toward the skimming doors and keep the bath of metal in the blast zone uncovered. The walls and the hearth of the furnace are not affected during the scorification. The process is applicable to furnaces of large size.

The dictum that barytes in zinc ores is injurious by causing the formation of a sulfid of the zinc has been contradicted by the experiments of Prof. Prest and others. The evidence of these experiments is confirmed by the studies of K. Sander, who charged 10 retorts with 400 kilograms of roasted blende containing lead and 9.2 per cent. of barytes, and another set of 10 retorts with roasted blende free from barytes. The residue from the former set of retorts assayed 2.70 per cent., and that from the latter 3.54 per cent. of zinc. In a repetition of the experiments the percentages of zinc in the residues were 2.08 per cent. and 2.92 per cent. respectively.

In the application of the Mond nickel process to the Sudbury pyrrhotite, the ore is roasted and melted to a matte containing about 20 per cent. of nickel. This is Bessemerized to a product containing 18.62 per cent. of copper, 31.37 per cent. of nickel, and 0.7 per cent. of iron. The matte thus concentrated is dead roasted and treated with dilute sulfuric acid, whereby about two-thirds of the copper and from 1 to 2 per cent. of

the nickel are extracted. The residue after drying assays from 40 to 60 per cent. of nickel. It is treated in charges of 500 kilograms with water-gas in a reduction-tower at a temperature of not more than 300° C. The tower is fitted with 14 hollow shelves heated to 250° C., on which the material is raked from one to another to the lowest shelves, which are cooled. The reduced copper is then transferred to another similar tower called the volatilizer, in which the metal is treated with carbon monoxid at a temperature not exceeding 100° C. The residue from the volatilizing tower goes back to the reducing tower, and the charge is thus passed back and forth from tower to tower for from eight to fifteen days. When 60 per cent. of the nickel has been volatilized as carbonyl, the residue is returned to the roasting furnace. The nickel carbonyl is treated in the decomposing apparatus, in which the nickel is recovered as granules of from 99.4 to 99.8 per cent. purity.

Alloys.—The Committee on Alloys reported to the British Association that the research for which it was formed had been completed, and a summary of the results had been published in the Proceedings of the Royal Society. The work consisted in a study of the chemical compounds and solid substances to be found in alloys composed of copper and tin. The report shows that at least three series of solid solutions are formed during the solidification of these alloys. The first series, which may be called Alpha, consists of crystals isomorphous with pure copper and varying in composition from pure copper to an alloy containing about 9 per cent. by weight of tin. These alloys solidify to a uniform mass, and apparently remain unchanged at all lower temperatures. The second series, which may be called Beta, contains percentages of tin varying from 22.5 to 32. Alloys containing between 9 per cent. and 22.5 per cent. of tin solidify as a complex of crystals of Alpha and of Beta. But all such alloys having from 9 per cent. to 32 per cent. of tin undergo important recrystallizations after they have wholly solidified, and their final condition below 500° C. is that of a complex of Alpha and of a crystalline body which is probably Cu₃Sn. Alloys from 32 per cent. of tin to 52 per cent. begin to solidify by the formation of a third type of crystalline solid substance, which may be called Gamma. But the Gamma crystals break up at lower temperatures into a complex of crystals of the body Cu₃Sn and another substance. The alloy of the formula Cu₃Sn is apparently a solid solution when first solidified, and is not converted into the compound until a lower temperature is reached. Gamma crystals containing more than 41 per cent. of tin have the peculiarity that, in cooling, they break up into solid Cu₃Sn and a liquid. Between 57 per cent. of tin and 43 per cent., the first solid that forms when the liquid alloy begins to solidify consists of Cu₃Sn; but when the temperature falls to 400° C. these crystals become unstable, and a reaction takes place between them and the liquid, which results in their partial transformation into a body which is really a quite pure CuSn. Between 93 per cent. and 99 per cent. of tin, the substance CuSn is the first body formed during solidification. Between 99 per cent. and 100 per cent., tin appears to crystallize first. The paper closes with a summary of the condition of the alloys at common temperatures, it being assumed that they have been cooled with sufficient slowness.

Fuels.—A paper on smokeless fuels read in the Engineering Club of St. Louis, Mo., mentioned powdered coal as promising to be the cheap-

est and most available, but found the greatest hope of relief from smoke to be in learning how to burn the ordinary fuels smokelessly. Much might be done by careful firing alone. No patent device would work satisfactorily with careless firing. Special devices were divided by the author into four classes: 1. Steam jets above and below the grate were reasonably effective, but were not economical of fuel. They should be turned on at the time of firing, and turned off in two or three minutes after the fuel has ignited. 2. Cooking-furnaces or fire-brick arches were capable of giving almost perfect results if properly designed and intelligently operated. They were best adapted for plants where the service is reasonably uniform. 3. Down-draft furnaces have proved very successful, and have come into extensive use where excessive demands for over-work are frequently made. One form was mentioned which has one grate above the other, the bars of the upper grate being water-tubes connected with the circulating system of the boiler. The gases must pass downward through the bed of fuel. 4. Automatic stokers, including fan devices and chain-grates, have come into use in large modern plants. Their first cost and the expense of repairs are high, but they save materially both labor and fuel. They are not all equally well adapted to all fuels, and the question should be studied out for each one separately. 5. Powdered fuels have been employed successfully in cement kilns and under boilers. The plant necessary is somewhat elaborate, and as the fuel is liable to spontaneous combustion it must be produced as it is used, and thus can not be stored or handled in large quantities. Combinations of these five types are frequently made, as, for instance, the fire-brick arch with the mechanical stoker and steam-jet. On locomotives and steam-boats, brick arches and steam-jets have given the best results. Oil is used also. But no apparatus or device can dispense with intelligent handling.

The subject was treated in papers in the section of engineering of the British Association, when Mr. W. H. Booth pointed out the difference between long and short flaming coal, and discussed the effect of volatilizing solid hydrocarbons on the distribution of temperature in a furnace and the production of heat at and beyond the grate surface. Though less heat was produced at the grate surface, the total heat production of bituminous coal was eventually secured if suitable furnace arrangements were provided for the purpose. The bad effect of cold water-pipes in the path of the furnace gases was referred to. Though so bad as usually fixed, the common form of water-tube boiler could easily be set so as not to produce smoke. The furnaces should be so arranged that all the gaseous products would be swept together with all the admitted air, and not be cooled down until sufficiently burned to admit of being used. For this purpose furnace lining should be non-heat absorbent. The author's conclusion was that smokeless combustion of bituminous coal was as easy and certain as the reverse method.

Mr. J. S. Raworth described a system of preventing the formation of smoke in a boiler furnace by injecting a mixture of air and nitrate-of-soda solution upon the fire.

Owing to the growing scarcity of good coking coals in Great Britain and on the Continent of Europe, efforts have been made to improve the quality of the coke derived from the output of inferior coal-seams. Experiments and apparatus for compressing the fuel before coking were de-

scribed by Mr. John H. Darby at the meeting of the British Iron and Steel Institute in May. The essential appliances of the apparatus are stamping-machines and compression boxes for preparing the coal for the coking ovens. In the result it was found by the author that the compressed coke was considerably denser than the ordinary coke, the lumps were larger and firmer, and the breeze, or small, coke was greatly reduced in quality. A cognate paper was that of Mr. J. Thiry on the recovery of by-products in coke-making. The Otto Hilgenstock oven was described in detail, and the gases produced were shown by the analyses to be very pure when freed from the by-products. Further, a high-class coke, both as to quality and yield, was obtained.

The briquetting process, according to a paper by Mr. W. C. Irwin, is applied in the United States to mineral fuels, fine ores, fine dusts, and ores of the precious minerals. In briquetting minerals, lime is used as a binder. In briquetting coal, the coal is reduced to pulp, heated to from 100° to 200° F., and cemented by the warm binding material, without altering the chemical composition of the coal or the binder. It is pressed at 5 tons to the square inch. Coal is briquetted with petroleum at Stockton, Cal. Many smelters in the West, by briquetting their fine dusts and slimes, save from 20 to 50 per cent. of their ore. Bricks are made so hard by means of the improved mineral presses that the danger of crumbling is avoided. Fine iron ore is briquetted at many iron plants at a total cost of less than \$1 a ton. In large smelting-works where great quantities of dust are formed, this affords a practicable means of disposing of the dust and removing a dangerous explosive.

Furnaces.—The novel features of a proposed method of combining the blast-furnace and the open-hearth furnace described by P. Evermann consist in the employment of blast-furnace gas in the open-hearth furnace, in arrangements for improving the quality of the gas, and in the application of air-nozzles to one of the hearths.

An apparatus designed to obviate the difficulty met in storing dust fuel arising from its liability to spontaneous combustion and its property of absorbing moisture has provision for the creation of a supply of powdered fuel as fast as it is consumed. It comprises a crusher in which the raw coal is pulverized to the size of rice or buck-wheat coal; a drying furnace, which is used when the coal contains more than 6½ per cent. of moisture; a grinding-machine; an air-separator, with elevators and storage-bins; and a burner through which the dust fuel is admitted to the boiler-furnace. In the grinder the crushing action of metal balls is used. These are held loosely in pockets in the circumference of a rotating disk enclosed by a steel ring. The air-separator is provided with a fan so arranged as to lift the fine dust from a central shoot to an external annular chamber, while the coarser particles fall down the central passage and return to the grinder. The finished dust is fed automatically by a vertical pipe from the storage-bin to the burner, which consists of a short horizontal pipe with a nozzle for a jet of compressed air, placed centrally. The air and coal-dust issue well mixed and in the manner of a stream of gas issuing from an orifice.

Damage to the ends of air-blast pipes by the high temperature is prevented in a new system invented by J. Foster, in which the water is not applied under pressure, but is aspirated through the tuyère by suction; and the tuyères are cooled

in such a way that leakage of water into the furnace is prevented. When a tuyère becomes damaged or leaks, instead of water entering the furnace, air tends to enter the tuyère and to destroy the vacuum, and the molten iron and slag usually close up the hole immediately. The vacuum system possesses several collateral working advantages, among which is the rapidity with which a defective tuyère can be removed and replaced by a sound one.

Electrical furnaces are described by C. E. Jacobs having pure carbon block linings, reinforced by magnesia or chalk blocks or other poorly conducting material, with which a temperature approaching $4,000^{\circ}\text{C}$. may be obtained and commercial work carried on at temperatures of from $2,500^{\circ}$ to $3,000^{\circ}\text{C}$. In such furnaces at high temperatures silicids of the alkali-earth metals— CaSi_2 , BaSi_2 , and SrSi_2 —are formed when oxides, carbonates, sulfates, or phosphates of the metal are mixed with silica in suitable proportions with carbon to reduce them; or by mixing alkali-earth silicates with carbon. These silicids are white or bluish-white, with metallic appearance, oxidize slowly, and decompose water with evolution of hydrogen. With dilute hydrochloric acid, calcium silicid forms calcium chloride and silico-acetylene— Si_2H_2 —as a yellow crystalline solid. When heated in a close tube these substances give hydrogen and amorphous silicon. Barium silicid treated with water is a cheap and convenient source of hydrogen when it is desired to obtain that gas on a large scale; and is efficient in operations of reduction. It can be used in perfectly neutral solutions. Melted with iron containing sulfur or phosphorus, the alkali-earth silicids form sulfides or phosphides of the alkali metal, while the silicon unites with the iron. By oxidation the sulfides or phosphides become sulfates and phosphates, and pass into the slag; and it is represented that in this way sulfur and phosphorus have been entirely removed from iron.

An electric furnace for steel smelting was completed at Gysinge, Sweden, in 1900, and on the experimental trial was found to produce steel of excellent quality, but not on the scale then adopted. Larger furnaces, working on a commercial scale, have since been erected. The steel produced is described by F. A. Kjellin, engineer of the works, as being of superior quality and characterized by strength, density, uniformity, toughness, and ease of working in a cold, unhardened condition, even when containing a very high percentage of carbon. Compared with other steels it has less tendency to crack or warp when hardened. The manufacture of special steels, as nickel, chrome, manganese, or wolfram, is not considered likely to meet with any difficulties. The chrome steel and wolfram as produced at Gysinge have proved to be excellent for lathe tools. When used for permanent magnets, the Gysinge wolfram has been found to give stronger magnets than other wolfram steel, and has not wasted in the hardening. The furnace also promises to be economical in operation.

The Chartier oil-melting brass-furnace consists of a cylindrical iron casing lined with fire-brick, set on axial trunnions, turned by a hand wheel, fed at one end by an oil air-burner. The products of combustion pass out through a hopper into which the brass to be melted is dropped. With oil at 4 cents a gallon, the cost is 15 cents per hour. Natural gas may be used. The furnace at the J. W. Paxson Company's mills, Philadelphia, melts 600 pounds of copper-tin bronze ingots in one hour, and 600 pounds of turnings in two hours.

Processes and Apparatus.—The Stassano electrometallurgical process aims at replacing the heat of the combustion of coal in the ordinary metallurgy of iron by the electric arc. The roasted and powdered ore is first passed through a magnetic separator in order to prepare a material rich in iron. This is analyzed, and the amount of carbon required for its reduction is calculated. The mineral is next mixed with the necessary amount of powdered wood charcoal and tar, the percentage of carbon in which is known, and a slag-forming material, and is made into briquettes. These are then introduced into the electric furnace. The chemical reaction is at first very lively, but becomes quieter after a time, and the amount of heat necessary continually decreases. A furnace of 150 horse-power will yield in from one-half to three-quarters of an hour nearly 30 kilograms of wrought iron. By varying the amount of carbon added according to the analysis which has been made previously, it is possible to prepare a cast-iron of a certain fixed percentage of carbon. A plant is at present working at Darfo in the province of Brescia, Italy, and uses a fall of 30 meters of 5 cubic meters of water per second.

In a new welding process by S. Baldy, Sr., of Chester, Pa., a master-mold having been made from the original pattern, a number of fusible patterns are cast in it. The fusible pattern is then put into an iron flask, which is filled with sand by means of compressed air. On exposure in the drying-oven, the fusible flask is melted out, after which the casting is made in the dried mold. Skilled labor is not required in this process, and the resultant castings are seamless and without fins. It is practicable by this process to produce utensils in exact duplicate.

In the process of Petersky and Ivanoff for utilizing petroleum in the production of pig-iron in connection with a certain amount of solid fuel, the solid fuel is placed in a special generator, into the lower part of which the treated gases from the combustion of petroleum are introduced. The fuel charged from above gradually falls to the bottom and becomes heated. Dry distillation results, and the gaseous products are drawn off from the upper part of the generator and utilized for fuel, while the resulting coke continues to descend. The products of combustion entering the lower part of the generator pass over the incandescent coke, are deoxidized, and are thus available as reducing agents which can afterward be used in a second furnace. This furnace, which is used for producing iron, resembles an ordinary blast-furnace, from which it differs merely in having a tube running down the center. The ore and fluxes are placed in the space between the walls of the furnace and the central tube, the latter being charged with a quantity of coal sufficient to supply the iron with the requisite amount of carbon for converting it into pig-iron, and also, if necessary, with fluxes for changing the composition of the slag.

As an example of a new departure in the processes by which the materials used by engineers are formed into machines or tools, Mr. W. J. Taylor, in the British Association, instanced the formation of a milling cutter between 3 and 4 inches in diameter, with deep teeth on its periphery and on both faces. This cutter had been formed cold from a blank of tool steel by hydraulic pressure, and was said to serve its purpose as well as any cutter milled from a solid blank. In operations of this nature, time was of considerable importance. Some remarkable work had been done, in cycle-making and other in-

dustries, in the drawing of sheet metals in the press. One of the limitations of the method arose out of the hardening of the metal during treatment. In forging steel, small articles were produced satisfactorily in quick-acting drop-presses; large articles demanded the slowly acting hydraulic press. In dealing with the problem of cutting action, the author pointed out that cutting was largely composed of shearing. In turning mild steel, for example, the tool acted by compressing the material in front of it until ruptures occurred by shearing in front of the chip. In an extremely plastic substance, or one which was both elastic and plastic, chips could be removed without shearing action, because they would be sufficiently elastic or plastic to bend or flow without rupture, and would permit the passage of the tool. In planing wood with the grain the chips would not be removed by intermittent shearing, but, if ruptured at all, would be ruptured by bending. Should rupture occur in advance of the cutting edge of the tool, perfect cutting action would cease, and rupture of the chip would not be an essential part of the cutting action. Passing to the action of grinding machinery, the author pointed out that the removal of metal by abrasion at high velocities was probably largely due to the heating of the particles removed.

Facts respecting the workings and economy of installations of electric machinery for the transmission of power were given in a paper read by Mr. D. Selby-Bigge at the summer meeting of the Iron and Steel Institute. In one of the Westinghouse Company's works a reduction of more than 32 per cent. in coal consumption was made by the adoption of electric transmission. An article was quoted from the journal *Traction and Transmission* in which it was said that the saving due to the electric transmission of power was probably nearer 60 per cent. than 50 per cent. In a colliery the sum of £1,500 was saved per annum at one shaft by the use of electric motors for pumping. In another colliery, where the pumps were originally driven by endless wire rope, the expenditure of a little more than £3,000 in electric plant resulted in the annual saving of between £1,500 and £1,800. A similar case was quoted of a Scottish colliery, and other details were set forth as to the cost of labor and material for driving by electricity and other means of transmitting energy, all more or less in favor of the former. The importance of utilizing gas from blast-furnaces was also dealt with in this paper. Gas-engines have been driven in this way, and they should be made to actuate blowing-engines or dynamos from which currents could be distributed throughout the works. At Seraing a Cockerill gas-engine of large size used about 100 cubic feet of average blast-furnace gas per effective horse-power per hour. This was less than one-fourth of the gas that would have been burned in the boilers of good modern condensing steam-engines. It is estimated that for every 100 tons of coke used in an ordinary Cleveland blast-furnace there is a surplus of at least 1,500 horse-power. "It would be impossible," the author said, "to overrate this new development in power production." The sources from which electricity can be produced most economically for the transmission of power when sufficient sources of water-power are not accessible "will be undoubtedly due to the development of large power gas-engines making use of the surplus gases from the blast-furnaces, which would otherwise be wasted."

Miscellaneous.—The finest monochromatic shades can be produced on platinum and German silver by the electrolytic decomposition of manga-

nous salts, the metal to be treated being connected with the positive electrode. In determining the strength of the manganese solution, the power of the electric current should be considered; the weaker the current the stronger the solution should be. The color produced changes greatly and quickly, so that the current must be broken the instant the color desired has been produced. Golden yellow, green, and purple are obtained with particular brilliancy. The metal should be removed from the bath as soon as the current is stopped; rinsed with distilled water; and carefully dried with soft blotting-paper. If manganese chloride or lead acetate is used, the colors appear in rings instead of as a uniform layer, and of all the colors of the rainbow in the softest shades—the paramount hues being green, golden yellow, and blue, while each whole system of rings is surrounded by a yellow zone.

The observation is made by G. P. Blakiston that pieces of wrought iron or steel in crucibles or open-hearth furnaces melt inside first, leaving an outer film which is later in melting. The author's explanation of the phenomenon is that the melting-point of the outer layer is made higher by oxidation, while the melting-point of the unoxidized metal within is not changed.

Finding from comparative examinations of their microstructure as revealed in ends that have been sawed that rails that have been hot-sanded are finer-grained than those which have been cold-sanded, S. S. Martin infers that it is best to work the iron while it is hot, with a low temperature for finishing; but that the severest microscopical test is obtained with cold-sawed rails.

An important paper on the metallurgy of the cupola was read by H. E. Field before the American Foundrymen's Association, and is published in the *Age of Steel* for July 5, 1902.

Rails that had failed in service which were examined by R. Job were found to be characterized by a coarse, regular granular structure and by containing an excess of foreign matters, such as oxides, slags, and occluded gases; while rails of the same general composition which had proved satisfactory in service were relatively free from foreign matter and gas, and presented a generally fine granular form, interlocking and broken up.

An invention which has been tested in Chicago for applying electricity to the cutting of iron or steel includes a carbon attached to a wooden handle by means of a metal clamp; to this clamp a wire is fixed, which is connected at the other end with the object to be operated upon. As the carbon is moved along the object it cuts its way through even such metals as Bessemer or chrome steel. In the case of the Chicago experiment, a wide space was cut away in the plate of a large boiler foundation which was to be removed, at the rate of about one foot every five minutes.

From the investigations of the sulfur contents of slags, described by Baron Juptner at the meeting of the Iron and Steel Institute, the following conclusions were drawn: If during metallurgical processes a state of equilibrium is established between the slag and the contiguous metallurgical product under treatment, the sulfur distributes itself between the two in a constant ratio—the coefficient of distribution—the value of which is dependent on the composition of the two phases under consideration and the temperature. In general the value of the coefficient of distribution increases with the basicity of the slags. It increases also apparently with the proportion of lime and manganese oxid, and probably also with that of fer-

rous oxid and zinc oxid in the slag. In the case of alloys of iron it increases and diminishes with the increase and decrease of the basicity of the slag. The same law holds good with respect to the influence of a higher percentage of lime and manganous oxid in the slag. The conclusion reached regarding the effect of the composition of iron alloys may be explained by the supposition that the capacity of manganese, and perhaps also that of iron carbide, or at least of iron rich in carbon, to absorb sulfur is very low, while that of pure iron and phosphid of iron is very high. These facts show that in metallurgical operations in general it is impossible to eliminate entirely from the product the whole of the sulfur contained in the charge. The extent to which desulfurization can be carried depends on the coefficient of distribution—that is, upon the composition of the two phases occurring during the process. For this reason, the desulfurization of irons rich in carbon and manganese (ferro-manganese and pig-iron) is more complete than that of irons low in carbon and manganese, such as the irons produced by the open-hearth of the Bessemer process. In the Bessemer process, the phosphorus exercises an additional counter-influence to desulfurization; but this appears to be possible only when the phosphorus is largely decreased; in such case, however, the carbon and the manganese have almost entirely disappeared. In order, therefore, to keep the sulfur down to the lowest possible margin of iron which is very low in carbon and manganese, we must select a charge that contains the lowest possible sulfur, consisting of pure iron or iron that has been desulfurized; or must repeatedly remove the old slag, permitting the formation of new slag. In this method a mixer could be employed with good effect, since it supplies a raw material low in sulfur, and its use also necessitates the removal of the mixer slag and the formation of new slag. The possibility is suggested of a third phase, a mixture of oxides and sulfides, occurring together with the slag and metal. The phenomenon seems to occur during certain segregations.

Experiments were carried on at McGill University, Montreal, by Profs. Anderson and Nicholson, in which filings or turnings of brass, iron, copper, tin, or other metals were forced under pressure into solid bars of metal differing very little in appearance and strength from such as are found in ordinary use. By bringing a pressure of 78,000 pounds to the square inch to bear upon them, the filings or turnings were welded into a solid whole. They were first encased in a jacket made of steel and conical in shape. At the end of ten minutes of continued pressure the tube was removed and opened, when a solid bar of metal was found. It was even found easy to solidify the filings of Pittsburg brass, which is perhaps the hardest brass manufactured. The metal proves to yield readily to pressure.

METHODISTS. I. Methodist Episcopal Church.—This Church comprised in 1902 129 annual conferences, 11 mission conferences, and 15 missions. The following statistics are given in the Methodist Year-Book for 1903: Number of bishops, 21; of ministers in full connection and on trial, 17,922; of local preachers, 14,024; of lay members and probationers, 2,997,772; of Sunday-schools, 32,669, with 351,402 officers and teachers and 2,758,429 pupils; of churches, 27,875, valued at \$126,085,111; of parsonages, 11,742, valued at \$20,519,559. Contributions: For missions (church, \$913,565; Sunday-school, \$431,679; Woman's Foreign, \$396,499; Woman's Home, \$296,

908), \$2,038,651; for church extension, \$145,499; for the Sunday-School Union, \$25,502; for the Tract Society, \$21,830; for Freedman's Aid, \$135,218; for education, \$280,072; for the American Bible Society, \$30,595; total, adding \$1,765, the distribution of which is not indicated, \$2,679,132. The number of members shows an increase for the year of 47,257 with 61,316 pupils added in Sunday-schools. The increase in benevolent contributions was \$307,501. The enrolment of the Epworth League comprised 21,366 senior chapters, 8,082 junior chapters, 202 affiliated Christian Endeavor Societies, and 100 affiliated Junior Endeavor Societies. The Twentieth Century thank-offering fund of \$20,000,000, to be applied to purposes of education in the United States and foreign lands, charitable and philanthropic work, city evangelization, support of conference claimants, payment of debts on church property, and any specific objects in mission fields, which was undertaken on the recommendation of the bishops in 1898, was completed in the later months of 1902.

Committee of Church Extension.—The General Committee of Church Extension met in Philadelphia, Nov. 5. The receipts for the year had been, on the General fund, available for donations, \$183,694; on the Loan and Annuity funds, \$435,368; making the total amount available for use, \$619,062. Three hundred and thirty-eight churches had been aided. The total net receipts of the committee from its beginning in 1865 had been \$7,748,781, and the whole number of churches aided had been 12,356. The committee had been assisted in making additional grants in certain conferences beyond the amounts regularly appropriated to them by occasional frontier and memorial gifts of \$250 each; and it desired to form a new Permanent Building fund, to be administered on frontier conditions. The work of building frontier churches by the application of special gifts of \$250 each had been largely extended. More than 700 churches had been made possible by this form of donation. By the aid of these gifts churches are erected worth \$1,250 above the value of the ground. More than \$9,000 had been given and a loan of \$3,000 granted to churches in Porto Rico. The sum of \$5,000 (by special memorial gift and grant from the Church Extension funds) had been spent on a church in Manila, Philippine Islands. The sum of \$892,214 had been received in response to a call for a Twentieth Century thank-offering for church extension of \$1,000,000. This fund was to be applied partly to the erection of churches, one for each year of the Christian era to the end of the twentieth century, partly in securing additions to the Loan fund, and partly in the cancellation of debts on churches which had been aided by the committee. The estimates for the coming year called for the collection and appropriation of \$334,000.

Freedman's Aid Society.—The annual meeting of the Freedman's Aid and Southern Education Society was held at Troy, N. Y., Nov. 10 and 11. The total receipts of the society and the schools for the year ending June 30, 1902, had been \$480,500, showing an increase of \$101,073 from the previous year. Of these receipts, those from conference collections had amounted to \$105,182. The debt had been diminished by \$25,698, and was now \$110,249. Cash annuity gifts had been received during the year and invested of \$35,935, and were held to provide for the gradual liquidation of the debt. Of 24 schools among the colored people, 18, with property valued at \$1,410,000 and 6,306 students, and of 21 schools among

white people, 4, with property valued at \$515,000 and 1,654 students, belonged to the society, making the total valuation of property held by it \$1,925,000. The attendance at the schools had been the largest for many years, and aggregated 10,329 students under the care and instruction of 434 teachers, of whom 277 were preparing for the ministry and 708 to be teachers. The effort of the people to help themselves was especially mentioned. New buildings for three institutions had been largely erected and completed at an aggregate cost of nearly \$60,000, all of which had been collected through the local conferences or by special gifts made for the purpose. Students had paid \$84,830 during the year for tuition, room rent, and board, an increase of \$17,560 over the previous year. Increased appropriations had been made for industrial work, and industrial trade-schools which had been closed during times of stringency were now doing efficient work. In all the schools 3,569 students were receiving some form of industrial instruction. Appropriations of \$139,758 were made for the ensuing year.

General Missionary Committee.—The annual meeting of the General Missionary Committee was held in Albany, N. Y., beginning Nov. 12. The treasurer reported that the receipts for the year ending Oct. 31 had been \$1,345,298, and the disbursements \$1,219,597. The receipts showed an increase from the previous year of \$112,112. A balance in the treasury of \$29,143 was returned. A motion to employ a field secretary among the colored people in the South to inform them concerning missionary work in the South and stimulate their interest in it, was referred to the favorable consideration of the Open Door Emergency Commission. This commission reported that the Open Door Emergency movement had been very successful during the past year in stimulating the Church to greater activity and liberality in the cause of missions. The Board of Managers was requested to renew the commission, the missionary office was asked to cooperate in its work, and the expenditure of as much money as might be necessary for the vigorous prosecution of the same was authorized. Appropriations were made for carrying on the work of the missions during the ensuing year as follow:

I. Foreign missions: Germany, \$35,700; Switzerland, \$7,250; Norway, \$11,600; Sweden, \$15,000; Denmark, \$7,000; Finland and St. Petersburg, \$5,200; Bulgaria, \$7,239; Italy, \$45,000; South America, \$79,167; Mexico, \$51,586; Africa, \$40,000; Eastern Asia (China, Japan, and Korea), \$203,630; Southern Asia (India, Malaysia, and the Philippine Islands), \$175,570; total for foreign missions, \$683,942.

II. Missions in the United States: Conference missions, \$107,330; work in the mountain region, \$59,707; work on the Pacific coast, \$35,280; white work in the South (Maryland and Delaware excepted), \$46,350; colored work, mostly in the South, \$42,300; non-English-speaking missions, \$204,330; total for domestic missions, \$495,297; miscellaneous appropriations, \$166,058; total appropriations, \$1,345,297.

General Missionary Convention.—The first General Missionary Convention of the Methodist Episcopal Church met in Cleveland, Ohio, Oct. 21. Delegations were present from churches in nearly all parts of the United States, and all the foreign mission fields were represented by missionaries or by bishops who had recently visited them officially or who now had episcopal supervision of them. The object of the convention was to review what had been accomplished by missionary work in the past and to study the present condition of mis-

sionary enterprises, their needs, the openings they offered; to consider ways and means of continuing and enlarging them, to stimulate interest in them, and to promote a spirit of personal devotion in sustaining them and in engaging in their service. A program had been prepared for the meeting, embracing 31 topics for addresses, treating upon every subject bearing upon missionary work, each of which was presented by a speaker selected with respect to his qualifications to discuss the theme assigned to him. These themes included the emergency which confronted the Church in its missionary work, created by its very success and rapid growth, and the opportunity lying before the Church in the work of worldwide evangelization; Spiritual Preparation for Missionary Service, the allies of the missionary society (or cooperating agencies) in the work of evangelization; a review of Methodist missions in the nineteenth century; the problems presented by the negro, foreign populations, and the cities; Open Doors in the Pacific islands, Latin countries, eastern Asia, Africa, and southern Asia; practical phases of the missionary problem as applying to individuals, churches, and church workers; The Place of Prayer in Missionary Work; The Young People and Missions; the necessity of going forward in missionary work; and spiritual and economical aspects of the subject. One of the sessions was given to sectional conferences—of presiding elders and district missionary secretaries; of pastors; of editors; of the Epworth League and Young People's Societies; of college presidents; and of laymen. The appeals made during the meetings for offerings of money brought subscriptions amounting to \$330,000. The convention requested the General Missionary Committee, at its coming annual session, to ask the Church for an average of at least \$1 per member for missions for the year 1903. An appeal was ordered to be made to the Church, setting forth the need of cooperation on the part of the entire body and asking that the convention subscription be increased to \$500,000. The appeal, as issued, further asked for subscriptions of \$3,000,000 for the next year, and added that 148 new foreign missionaries were needed in the near future, in addition to the pressing requirements of the home fields.

The Woman's Home Missionary Society had 193 missionaries and teachers, besides a large number of deaconesses employed in city work. It had erected the Tillman Avenue Mission Building, in Detroit, for work among the Poles and Bohemians, had completed the Boston Medical Mission Building, and Rust Hall, in Washington, for the training of missionaries and deaconesses; had opened a new Deaconess Home at Portland, Me.; and had purchased buildings for the training of Christian workers and for Spanish work in San Francisco.

The Woman's Foreign Missionary Society sent out 21 missionaries in 1902, and had at the end of the year 246 missionaries in service.

Under the auspices of the National City Evangelization Union, local societies for city evangelization were maintained in 52 cities.

The new constitution of the Church, which was submitted to the annual conferences by the General Conference of 1900 (see *Annual Cyclopædia* for 1900), and was voted on by them in 1901, having received the requisite three-fourths of the votes cast, its adoption as the fundamental law of the Church was proclaimed by the bishops at their semiannual meeting, May 6.

Consolidation of Benevolent Societies.—Under instructions of the General Conference of

1900, a commission of 15 members was appointed by the bishops to consider whether it is advisable to consolidate the benevolent societies of the Church, and if so, to report a practicable method of doing it so as to lessen the number of collections without diminishing the support of the causes represented. This commission met in Ocean Grove, N. J., July 2 and the following days of the same week. All the aspects of the subject were discussed; but inasmuch as many questions were started the decision of which required careful investigation and expert legal counsel, it was found impossible to reach a final conclusion. A subcommittee was appointed to collate material facts and compare the various propositions and report to a subsequent meeting.

Bishop Simpson Memorial.—A memorial window of Bishop Matthew Simpson, who was a bishop of this Church from 1852 to 1884, which was procured by means of money contributed by American Methodists, was unveiled in Wesley's Chapel, City Road, London, Nov. 14. Addresses were made on the occasion by the Hon. Joseph H. Choate, ambassador of the United States to the court of St. James, and the Rev. Herbert Welch, D. D., of the New York East Conference, representing the Methodist Episcopal Church. The window represents St. Paul preaching at Athens, and bears in one corner a medallion of Bishop Simpson. At the bottom is the inscription: "Erected by American Methodists to the memory of Bishop Matthew Simpson. He was born 21st June, 1811, and died 18th June, 1884. He was a holy man, an eloquent and mighty preacher, and a great bishop."

II. Methodist Episcopal Church, South.

The following are the statistics of this Church as given in its Year-Book for 1903: Number of bishops, 13; of annual conferences embraced in the plan of episcopal visitations, 48; of traveling preachers, 6,293; of local preachers, 4,982; of members, 1,516,516; of Sunday-schools, 14,133, with 103,486 teachers and 884,329 pupils; of Epworth Leagues, 3,234, with 115,099 members; of educational institutions, 77, with 11,983 students, and buildings and endowments valued at \$7,522,583. The years' receipts of the Missionary Society were \$357,248; of the Woman's Home Missionary Society, \$725,946; of the Woman's Foreign Missionary Society, \$104,018; contributions for the American Bible Society, \$10,424. The publishing house returned assets of \$926,095, 4 connectional publications, and 8 Sunday-school periodicals.

The General Conference met in its fourteenth quadrennial meeting at Dallas, Texas, May 7. The episcopal address, read at the opening session, reviewed in full all the various interests of the Church, showing their progress and tendencies during the past four years, and pointing to or suggesting such modifications or reforms as the conditions and the times seemed to make desirable. In reference to the action of the Joint Commission of Federation with the Methodist Episcopal Church, which had been ratified in full by the General Conference of 1898, the address referred to the action of the General Conference of the latter body in 1900, which modified these agreements at one important point, but accepted all the rest, and continued: "Here the matter of federation stood till a few weeks ago. A meeting of the joint commissioners was held in Baltimore, March 21, 22, 1902. After the most brotherly conference the commissioners from the Methodist Episcopal Church expressed their sincere regret that the original plan had not been adopted without alteration by their General Conference, and agreed to report it a second time with an urgent

recommendation that it be passed. The joint commission also, in the exercise of the authority bestowed upon it, advised that the bishops of the two Churches proceed to appoint the committees to prepare the common hymn-book, common order of worship, and common catechism for the two Churches. As all the steps were authorized at our last General Conference, it is not necessary, we think, that any further action should now be taken in the premises, except that the commission should be continued for another four years." In reference to the disquiet which the Church had suffered for several years past on account of the controversy concerning the collection of what was known as the "publishing house war claim" (see Annual Cyclopædia for 1898, pp. 443, 444), the bishops represented that their relation to the questions involved in the matter began with the meeting of the college of bishops at Nashville, Tenn., July 4, 1898, when, while reaffirming the justice of the claim, they insisted that the Church could not afford to accept payment of it as a gratuity or on conditions that reflected on its honor. "Inasmuch, therefore, as some Senators have affirmed on the floor of the Senate that they were induced to support the claim by misleading statements on the part of representatives of the Church—statements, however, which did not affect the merits of our claim—we hereby give this assurance: that if the Senate by affirmative action declares that the passage of the bill was due to such misleading statements, we will take the proper steps to have the entire amount returned to the Government." This was communicated to the president of the Senate, to be laid before that body. On May 5, 1899, the bishops made a statement that having found that the Senate after full investigation had exonerated the Church from all censure, "we transfer to our record that official action: 'Resolved, That the report of the committee made July 8, 1898, be approved, and that no censure should rest upon the Methodist Episcopal Church, South, for the misstatements and concealments of the book agents in connection with the passage of the bill for the payment of the claim referred to in the letter of the bishops now under consideration; that the injury resulting therefrom affected only the beneficiaries of the fund and not the United States; and that the Senate should take no further action in the matter.' The Senate having thus declared that the United States sustained no injury in the passage of the bill, and declined to take any further action in the matter, we have no occasion to make further communication to that body. . . . That your bishops correctly interpreted the action of the United States Senate, we have the personal and authoritative assurance of a large majority of the Senators." The last sentence referred to a correspondence which had taken place between Bishop Candler and Senators A. O. Bacon and A. S. Clay, of Georgia, which was laid before the General Conference. Bishop Candler wrote to Senator Clay, who had been a member of the Senate committee having consideration of the matter, March 24, 1902, saying that he had interpreted the final action of the Senate as entirely exonerating the Church from blame in the case, and as eliminating the question of returning the money to the Government, "but I find some extreme men still insisting upon the necessity of returning the money to the Government. Such a course appears to me to be entirely impracticable, not to say impossible, and as being open to many objections of both right and propriety. . . . I am jealous for the honor of the Church, and I earnestly desire that the final action of the General Con-

ference shall not fall short in any particular of perfect wisdom and righteousness." In answer, Senators Clay and Mason wrote, with the written concurrence of nine-tenths of the members of the Senate, whose names were appended to their letter, that from their personal familiarity with what occurred in the discussions of the Senate concerning the matter, and from the subsequent investigation made by the Senate and the resolution which was adopted by the Senate as the result of the investigation, they found the Church not under obligation, either of necessity or of propriety, to return the money which had been paid it. "From our personal knowledge of what occurred at the time of the consideration and the passage of the bill, we are enabled to say that no Senators who voted in favor of the bill thereafter expressed dissatisfaction because of any act by the Church in securing its passage, or because of any regret on his part that the Church had received the portion of the money which was left after the payment of the commission which was complained of. The dissatisfaction which found expression when the fact of the payment of the large commission became known, was not because the Church had received a part of the money, but because it had not received all of the money. There were expressions by Senators to the effect that if they had known of the contract for the payment of the large commission, they would not have voted for the bill. By this they simply meant that they would have required the bill to be so amended as to secure to the Church the entire amount appropriated, excepting only such an amount as they would consider a proper fee for services rendered." Two reports were presented by the committee to which the subject was referred, that of the majority, which, after criticizing the features of the transaction that were objected to, advised that the action of the Senate be taken as a final and definite settlement of the whole matter; while that of the minority reviewed the proceedings of the Book Committee and their agents in presenting the claim to the Senate, condemned certain statements made by them as "misleading and deceptive," and declared that in making those statements their authors "did not properly represent the Church and were not its exponents in the ethical questions involved," and recommended that the entire sum collected, \$288,000, be returned to the United States Government. Neither of these reports was satisfactory to the General Conference, and the subject was again referred to a committee which brought in a revised minute. This report held that in view of the record of the action of the Senate and the bishops and of the correspondence just mentioned, "we are unable to see upon what ground there can be based the contention that the Church should make a second offer, and invoke a second refusal from the Government, or any department thereof," and concluded with the resolutions: "1. That the Church distinctly repudiates all the acts of concealment, misstatement, or unfairness on the part of any and all persons representing the Church in the prosecution of the claim before Congress, either intentional or otherwise, and whether the same did or did not affect the vote or opinion of any Senator or Representative. 2. That we indorse the purpose of the bishops in their communication to the United States Senate, and do hereby ratify and confirm their conditional tender of the money, and make their action the act of this General Conference and declarative of the mind of the Church, and that this action be entered on the journal of the General Conference as a final disposition of the

whole matter." This report and the resolutions were adopted.

With respect to federation (with the Methodist Episcopal Church), the General Conference approved and adopted the acts passed by the Joint Commission on Federation of the two Churches at their late session in Baltimore, Md., and recognized those that had also been adopted by the General Conference of the Methodist Episcopal Church as having the force of law. It further declared that it would recognize the other measures as being in force when they should have been adopted by the General Conference of the Methodist Episcopal Church. The bishops were authorized to act in concert with the bishops of the Methodist Episcopal Church in the work of preparing a common hymnal for public worship, a common catechism, and a common order of worship. In continuing the Commission on Federation during the coming four years, with the same powers as heretofore, the Conference expressed itself as acting in the confident hope that the General Conference of the Methodist Episcopal Church would in its session of 1904 adopt the action of the joint commission recommending that the General Conference enact provisions to the effect that when either Church is doing the work expected of Methodism in a place, the other Church shall not organize a society or erect a church building until the bishop having jurisdiction in the case has been consulted and his approval obtained. Provision was made for the appointment of representatives of the Church to the General Council of the National Federation of Churches to be held in 1905. In view of the movement toward the organic union of the 6 Methodist churches in Japan, the Conference approved conditionally of the entrance of its church there into the union, and appointed a commission, with power, to confer with the commissions of the other churches on the subject. A commission was appointed with full power to negotiate with the Missionary Society of the Methodist Episcopal Church in regard to establishing a joint publishing house in China, where this Church already had a publishing house at Shanghai. The sense of the Conference was expressed by resolution that no part of the periodicals published for Sunday-schools should be used for any other purpose than to teach the people the great principles and truths of the Bible; and it therefore directed that no part of those publications should be used for advertising purposes other than relating to the publications and institutions of the Church. By special resolution the address on worldly amusements was continued in its present place in the Appendix of the Discipline of 1902. The Board of Missions was authorized to organize, with the approval of the annual conferences and in cooperation with their boards of missions, a system of city missions; these missions to cooperate in all cases so far as possible with the Church Extension Board and with the Woman's Home Mission Board. The office of deaconess was instituted and placed in connection with the Woman's Home Mission Society. The article adopted on the subject provides that the board of that society shall prescribe a course of training for candidates for the office, and shall pass upon the application of persons recommended by the Quarterly Conference for admission to the school; and shall, upon application, recommend deaconesses to Church agencies wishing to employ them. Deaconesses, when employed, shall report to the Quarterly Conferences of the charges in which they labor, and shall be, as far as is practicable, under the direc-

tion of the preacher in charge. A Board of Finance was instituted, to be composed of the secretaries of the administrative boards and the book editor, to meet every four years and calculate the basis of assessments. Assuming that the declared educational policy in the Church aims at a well-organized system in which there shall be no waste of means, the General Conference resolved that the purpose of the Church should be not so much to seek to establish new secondary schools as to care properly for such as have proved themselves worthy; that the policy of having the secondary institutions of each annual conference correlate themselves with the college of that conference should be insisted upon and enforced; and that the conferences, in making their collections for education should, so far as practicable, concentrate those collections on the colleges and secondary schools of the Church. The movement for the improvement of rural schools was commended. A Board of Insurance was appointed to make arrangements for the more general and adequate insurance of the Church property. The proportion of laymen in the Board of Missions was increased. A correspondence school was authorized, to be directed by the Board of Education and the theological faculty of Vanderbilt University. The Rev. E. E. Hors, D. D., and the Rev. A. Coke Smith were chosen additional bishops.

More than \$2,000,000 had been subscribed to the Twentieth Century fund, and the sum of \$1,411,512 had been paid.

Union of Publishing Interests in China.—A joint committee representing the Missionary Society of the Methodist Episcopal Church and the Book Committee of the Methodist Episcopal Church, South, met at Baltimore, Md., Aug. 5, agreed upon a basis for the union of the publishing interests of the two Churches in China, and adopted a plan for a joint publishing house to be established at Shanghai. The plan was adopted dependent upon the approval of the Board of Managers of the Missionary Society in New York, and of the Book Committee at Nashville, Tenn., and was approved by the former body Aug. 12, and by the latter Aug. 20. The minute recording this transaction affirms that "it is desirable to unite in Shanghai, China, the publishing interests of the two Methodisms throughout the Chinese Empire," and provides that "this joint publishing house shall be known as the Methodist Publishing House in China; that the capital shall not exceed \$100,000 United States gold, \$50,000 of which shall be paid in full in equal sums of \$25,000 each by the respective parties to the contract." If a larger sum is needed to secure the efficiency of the concern, it can be called for by the Board of Directors which is provided for, upon the approval of the managers of the Missionary Society and the Book Committee. The ownership and interest in the publishing house are guaranteed in equal proportion to the two parties. The management of the concern is committed to a board of six directors, three of whom shall be chosen by each of the parties to the transaction. Two business managers, one representing each Church, of equal and coordinate authority, will carry on the business under the Board of Directors, serving for terms of four years, to be chosen in alternation, one every two years. A supplementary minute recites that "in the foregoing arrangement it is understood to be the purpose of this joint committee to secure entire equality in the management and proceeds of the projected publishing house in Shanghai between the two parties represented and herein united, and to provide for the

perpetuity of the harmonious relations hereby established between the two Churches in the mission field. It is our hope and prayer that, beyond all considerations of gain or advantage to either Church, the greater interests of the Church of God may be served and advanced. To these ends we pledge the men and means devoted to this work, as well as our own joint and individual efforts and influence."

III. African Methodist Episcopal Zion Church.—This Church has 3,475 ministers, 2,955 churches, and 537,337 members.

The third annual session of the Connectional Council of the African Methodist Episcopal Zion Church was held in Louisville, Ky., in the later days of August. The report of the general secretary indicated progress along all connectional lines. The general steward reported that \$34,495 had been raised for the General fund, \$778 on account of the ministerial brotherhood, and \$427 for the Contingent fund, and that \$2,700 had been paid to the Chicago church. The contributions to Livingstone College had been liberal, and receipts of \$27,456 were reported. The number of students was 340. The Lancaster High School, Atkinson College, and Greeneville College were also favorably reported upon, and the educational secretary spoke of his work as having been fruitful. Special importance was attached to the new Church Extension fund, and measures were resolved upon which it was thought if vigorously executed would bring it to the attention of all the people and promote good collections. The General Committee of Church Extension was authorized to incorporate under the laws of Pennsylvania. The Widows' and Orphans' fund amounted to \$276. The societies of the Varick Christian Endeavor Union were not organizing as fast as they had been. Reports were presented by the missionary and Sunday-school departments. Protests were uttered in the discussions of the board against the indiscriminate conferring and acceptance of honorary degrees.

IV. Colored Methodist Episcopal Church.—The 19 conferences of this Church return 2,061 ministers, 1,433 churches, and 204,972 members.

The ninth General Conference met in Nashville, Tenn., May 7. The bishops presented a quadrennial address reviewing the more important features of the history and growth of the Church during the past four years and offering many recommendations. The life of the Church had been quiet and harmonious. The ministry had grown in intelligence, devotion, and loyalty, "with broader views of spiritual relations and connectional conditions." In its organized and connectional capacity the Church had more broadly impressed itself on the public heart, and had widened its sphere of influence more largely since the last quadrennial session of its legislative body than in any former years. Its representatives and public servants and its general literature had more generally and strongly fallen in line with the trend of thought and the march of spirituality, and it was adapting its forces and movements to meet new conditions, the natural results of human progress. The Epworth League, instituted by the authority of the previous General Conference, had flourished and presented hopeful promise for the future. "Its influence and results had been wholesome, far-reaching, and signal." While deprecating the disposition to found or begin more Church schools than can be sustained, the bishops avoided putting themselves in such an attitude on the question as to hinder outside help and such assistance as may come from persons of wealth who may make

propositions to the Church on certain conditions. The publishing department was regarded as in a healthy and prosperous condition, encouraging the hope that it was approximating a permanent and self-sustaining basis. The Sunday-school department likewise was doing well. Action was taken favorable to organic union with the African Methodist Episcopal Zion Church, and a commission was appointed to confer with a similar commission of that Church on the subject. The Rev. Dr. C. H. Phillips, editor of the *Christian Index*, the official newspaper of the Church, was elected an additional bishop.

Joint Commission on Union.—The Commissions on Union of the Colored Methodist Episcopal and the African Methodist Episcopal Zion Churches, which had been appointed by the last General Conferences of these bodies, met as a joint commission to consider the subject of union of the two Churches in Washington, D. C., Oct. 7. Previous to the joint meeting the two commissions met separately to consider the terms of union which they should offer, and drafted propositions which were identical in all essential points. The sense of the joint commission was expressed that union between the two Churches was desirable; and articles of agreement to serve as a *modus vivendi* while the negotiations for union are pending were adopted by a unanimous vote of the 30 members constituting the body in substance as follow: "1. We agree not to attempt to organize churches or schools in any community or territory where the other Church is organized unless in the judgment of the bishops presiding the population and needs are such as to warrant another Methodist church or school. 2. We will cooperate in all our missionary work, the manner of this cooperation to be decided upon by the bishops and mission boards of the two Churches. 3. When members of either Church move to a community where the Church of their denomination is not organized letters should be given them to the other Church. 4. That there be a compilation, publication, and use of a common hymn and tune book, and a common form of public worship. 5. Frequent interchange of visiting and fraternal delegates in district, annual, and General Conferences; and the exchange of pulpit courtesy, to promote acquaintance and fellowship. 6. That we suggest as a name, 'The Colored Methodist Episcopal Zion Church.' 7. Pending the union, preachers will not be received, unless in good and proper standing in their own Church and conference; that a meeting of this joint commission be called, and that all the bishops and general officers of both Churches be requested to be present; that the agents of each of the publication houses of the connections represented be requested to keep for sale all the publications of their respective departments." Another meeting of the joint commission was appointed to meet at Charlotte, N. C., July 14, 1903, to form further basis for the union. The final action of the commission will have to be submitted to the General Conferences of the two bodies—of the Zion Conference in 1904 and of the Colored Conference in 1906, and then to the annual and quarterly conferences.

V. Free Methodist Church.—The annual minutes of this Church for 1902 give the number of members and probationers as 29,507, showing an increase of 313; of Sunday-schools, 1,103, with 6,711 officers and teachers, and 36,382 pupils; of churches, 1,067, valued at \$1,196,975; of parsonages, 522, valued at \$372,125. The number of ministers in 1901 was 1,003. The missionary re-

ceipts of the year covered by the annual minutes were \$15,315 for missions, \$2,191 for the India Orphan fund, and \$166 for the Africa Orphan fund. The native contributions for all purposes were \$566. The missions in India and Africa returned 264 native members and probationers, 12 Sunday-schools, with 26 officers and teachers and 650 pupils, and property in land and buildings valued at \$60,085.

VI. Methodist Church in Canada.—The following statistics of this Church for 1902 were published by the General Conference statistician in July: Eleven conferences (including Japan) and the West China Mission; number of members, 291,895, showing an increase for the year of 2,733; of Sunday-schools, 3,425, with 33,396 officers and teachers and 272,566 pupils, showing an increase of 6 schools, 754 officers and teachers, and 6,143 pupils; of Young People's Societies, 1,809, with 69,402 members, showing a decrease of 16 societies and 1,586 members; of members received on trial during the year, 19,002; of baptisms, 17,371; amount of contributions of Sunday-schools for missions, \$22,113; amount contributed for missions in connection with the Forward Movement, \$24,568. The statistics of membership show a total increase of 11,358 for the quadrennium or four years' term since the last General Conference and a net increase of 122,092 since the union in 1883, by which the Church was constituted. The total missionary contributions for the quadrennium were \$83,103.

The sixth General Conference met at Winnipeg, Sept. 4. The General Conference is constituted of equal numbers of ministers and laymen. The address of the general superintendent showed that the membership of the Church had increased during the quadrennium, or four years since the preceding General Conference, 11,358. This was the smallest quadrennial increase since the union of the churches in 1883. A diminution in the number of Epworth Leagues and Young People's Societies was also remarked. According to the tables in the census of the dominion for 1901, the Methodists had advanced during the past ten years at all points in the country except for a small decrease in Prince Edward Island, and the advance had been specially large in Manitoba, British Columbia, and the territories. The recommendations of the preceding General Conference that an effort be put forth to make class-meetings more attractive and spiritually helpful had been in a measure carried out. Class-leaders' associations had been organized and institutes or conferences held in a number of cities and larger towns, and similar conferences had been held in connection with district meetings. A report was presented by a Memorial Committee recommending that the words "layman" and "laymen" wherever they occur in the Discipline be interpreted to mean women as well as men. It was shown that this question of the status of women in the Church had been decided in the previous General Conference to be a constitutional one, requiring a two-thirds majority for any valid action upon it; and the Conference voted that it deemed it inexpedient to reverse its previous decision. The clause coming up again for final action, a tie vote resulted and it was declared lost; but presidents of auxiliaries of the Woman's Missionary Society, if members of the Church, were constituted *ex officio* members of the quarterly official boards. A report on the indebtedness of St. James's Church, Montreal, showed that the debt had been reduced from \$622,224 in 1898 to \$512,822; but that large subscriptions had been promised and other reduc-

tions were practicable, whereby the additional amount it was necessary to raise was brought down to \$182,697. A day was appointed for bringing the matter before every congregation in the Church, and a committee was appointed to take charge of it. The principle of increased and more authoritative supervision in home mission work was approved; the appointment of 4 superintendents of missions was provided for—one for New Ontario, two for Manitoba and the Northwest Territories, and one for British Columbia; the Board of Home Missions was authorized to increase the number of local superintendents as the urgent needs of the work may require; the appointment of a corresponding secretary for Manitoba and the Northwest Territories to whom the superintendents shall report was authorized; and the institution of a special fund for the payment of the mission superintendents was advised. The office of a permanent secretary to be appointed by the General Conference, and to act as a field agent in the interests of temperance, prohibition, and moral reform, was constituted. The pastoral term (in which a minister may serve consecutively at the same station) was fixed at four years; but exception was made in the case of the Fred Victor Mission. The time required to elapse between two pastorates on the same field by the same man was shortened from six years to four years. Numerous memorials had been received concerning Rule 35 in the Discipline prohibiting dancing, card-playing, theater-going, etc., some asking that the rule be made admonitory instead of prohibitory, and others that it be not changed. The Conference decided upon no change. The General Board of Missions was empowered to work with the Presbyterian Board of Missions, with a view to lessening the expenses of administration; also to superannuate medical missionaries and pay their claims out of the mission funds. Provision was made for the trial of charges against foreign missionaries who still retain their home membership by a mixed court of foreign and native missionaries, with a right of appeal to the home conference, whose decision shall be final, except on points of law. The proposed union of the Methodist Churches in Japan was approved, and a committee was appointed to confer with committees from the other Methodist Churches and take action in the matter. An invitation from the British Wesleyan Church to engage in mission work in India was declined, on account of the great responsibilities confronting the Church in the West. All the ministers were advised to hold up before their people a high standard of Sabbath observance; and ministers working under the Lord's Day Alliance were permitted to do so without losing their claims upon the Superannuation fund for years of service. The injunction against ministers speaking too long or too loud was stricken out of the Discipline. The Conference declared itself in favor of a measure of organic unity wide enough to embrace all the evangelical denominations in Canada; declared, "in no spirit of exclusiveness toward others not named," that it would regard with great gratification a movement having in view the ultimate organic union of the Presbyterian, Congregational, and Methodist Churches in Canada, such as had been proposed; commended the movement to the prayerful interest and sympathy of the Church; and directed the appointment of a committee of seven ministers and seven laymen to receive communications and confer on the subject. A special fund of \$250,000 was provided for, to be raised during the next year in connection with

the bicentenary of John Wesley, to be used for purposes of the Missionary Society. The establishment and furnishing of parlors and reading-rooms in the central churches of towns and cities, especially for those whose resources for social enjoyments are scanty, were approved. The report on temperance, as adopted, included a paragraph on political corruption. The official name of the Church is "The Methodist Church." A proposition to change it to "The Methodist Church of Canada" was defeated. Provision was made for the preparation of a course of study for local preachers, with a view to making more extensive use of them. The conviction was declared that "the development and maintenance of Christian citizenship requires at least some measure of religious as well as ethical instruction in our schools, provided it be not sectarian." The minimum salary of a married minister was made \$750, instead of \$600, as heretofore. The Committee on Church and Parsonage Aid reported that with the limited fund of \$25,000 valuable services had been rendered toward securing places of worship and other church property, especially in the Northwest Territories. Economical and industrial questions and conditions were reviewed in the report of the Sociological Committee. The report of the Committee on Civil Rights recommended that the existing table of ecclesiastical precedence at state functions be abolished; or, in case this course is impracticable, that the order of precedence at Dominion functions be based on the numerical strength of the religious denominations as ascertained by the most recent census; a similar basis to be used in the several provinces.

The Board of Missions met in Brandon, Sept. 22. The report of the General Secretary showed that the total income for the year had been \$306,429, showing an increase of \$36,114 over the income of the preceding year, the figures representing the largest income and the largest increase of any year since the union of the churches. Four superintendencies in the domestic missions were formed, and the superintendents were appointed, together with a corresponding secretary for Manitoba and the Northwest and the British Columbia Conference, as directed by the General Conference. The Young People's Forward Movement, under which \$24,000 were contributed to the support of the missionaries, was commended. The interests of the missions to the French, to the Japanese and Chinese in British Columbia, and to the Indians, and of the missions in Japan and China were considered. A committee was appointed to confer and cooperate with a similar committee appointed by the Home Mission Committee of the Presbyterian Church on questions of comity.

VII. Wesleyan Methodist Church (Great Britain).—The statistical reports of this Church for 1902 gave the following members:

CONFERENCES.	Ministers.	Lay preachers.	Church-members and probationers.
Great Britain.....	2,328	20,228	496,710
Ireland.....	253	622	28,650
Foreign missions.....	395	2,085	64,614
French Conference.....	87	85	1,646
	2,923	22,970	591,620

Number of churches, 11,523; of Sunday-schools, 9,084, with 137,596 officers and teachers and 1,060,164 pupils. The South African Affiliated Conference had 202 ministers, 3,915 lay preachers, 93,660 members and probationers, 589 Sunday-

schools, 2,613 officers and teachers, 38,118 pupils, and 826 churches; the West Indian Affiliated Conference, 93 ministers, 907 lay preachers, 45,726 members and probationers, 301 Sunday-schools, 2,758 officers and teachers, 28,750 pupils, and 143 churches. The Australasian Methodist Church had 932 ministers, 8,432 lay preachers, 131,774 members and probationers, 4,103 Sunday-schools, with 21,476 officers and teachers and 211,082 pupils, and 5,539 churches.

The Church had 7,374 chapels settled upon the terms of the Model Deed, with sitting accommodations for 2,075,802 persons, showing an increase in ten years of 506 chapels connectionally settled, and 173,142 sittings. In addition there were 913 rented chapels or other preaching places, seating 111,703 persons. The whole number of sittings in Great Britain was 2,187,505.

Sixty Wesley deaconesses and 8 second-year probationers had been employed during the year in 42 circuits and 7 missions, besides 2 in the Transvaal, 1 in New Zealand, and 2 in Ceylon.

The report of the General Chapel Committee showed that 411 cases of new chapels, school-rooms, ministers' houses, alterations, enlargements, etc., had been sanctioned during the year, with an estimated outlay of £365,286, on which such provision for payment had been made as would leave an indebtedness aside from the connectional loans of not more than £89,640. A total additional accommodation would be furnished on the completion of these improvements of 14,787 sittings. Of the new chapels, 39, to seat 7,253 hearers, were to be erected in places where there were previously no Wesleyan places of worship. Two hundred and twenty-five cases of erections, enlargements, etc., had been reported through the district synods as completed, at a cost of £178,718, with an entire indebtedness of £41,588. The net amount of debt cleared off during the year was about £12,000.

In the eighty-third annual report of the General Committee for the maintenance and education of ministers' children the amounts raised for the general purposes of the fund were given as £30,755 for maintenance and £4,977 for education. The sum of £10,608 had been appropriated to allowances for 884 ministers' children educated at home; and other appropriations had been made to schools.

The total income of the Home Mission fund had been £35,831, showing an increase of £1,304; and the expenditure had amounted to £33,396. This left a surplus of £2,434, available for the reduction of the adverse balance carried over for several years to £1,122. Grants of £4,791 had been made toward the support of home missionary ministers in circuits; £3,123 had been spent on lay agency; £1,691 on district missionaries; £1,872 on village evangelists; £8,798 on dependent circuits; £290 on university circuits; and £1,000 on special extension work. Toward the cost of army and navy ministers—£4,387—the Government gave £2,454 in capitation grants. More than 100 home missionary ministers and 8 connectional evangelists were supported by the fund. Twenty Gospel cars were in service, 5 of which had been added during the year, and were manned by 40 evangelists.

A novel legal question has arisen at Gloucester. The votes of 2 Wesleyan ministers were objected to by the Conservative agent at an election on the ground that the ministers had not resided in the district during the time required to qualify them as electors. The Liberal agent, supporting the votes, contended that the ministers in being transferred from one circuit to another were

"successors to a benefice or office," and as such were entitled to vote. The case came before a King's Bench divisional court, Nov. 7, on an appeal from the refusal of the revising barrister at Gloucester to allow the claim of the ministers. The Lord Chief Justice said that the question raised was one of importance to a great number of ministers who at present lost the right to vote for one year by reason of changes in circuits. The point was whether the revising barrister was right in this instance, on the evidence before him, in holding that the applicant had not proved that the post of Wesleyan minister was an "office" which came within the meaning of the statute, and gave him a right to vote by reason of succession to that office. The Chief Justice held, with the concurrence of the other justices, that the revising barrister was right. The applicant was backed, in making his appeal, by the Committee of Privileges of the Wesleyan Conference.

Wesleyan Missionary Society.—The annual meeting of the Wesleyan Missionary Society was held in London, May 5, Mr. Peter F. Wood, of Chiselmurst, presiding. The total ordinary net receipts for the year had been £100,478, while the addition of special contributions, miscellaneous income from investments, legacies, and lapsed annuities would bring the amount up to £136,528. The expenditure had been £143,617, leaving a deficiency of £7,088. Forty-four missionaries had been sent to India, Ceylon, Burma, West Africa, China, the Transvaal and Rhodesia, the West Indies, the Bahamas, South Africa, Honduras, Paris, Naples, Gibraltar, and Malta; 17 woman missionaries had gone to various parts of the field; and one lay agent had been sent to India. The general summary of the mission fields gave the following numbers: Of principal stations, 325; of chapels and other preaching places, 2,466; of missionaries and native ministers, including supernumeraries, 395; of other salaried agents, 3,337; of unpaid agents, 6,260; of full and accredited church-members, 50,132; of members on trial, 14,482; of pupils in mission schools, 100,738. These numbers show an increase of 26 stations and preaching places, 31 missionaries, 96 other salaried agents, 158 unpaid agents, 1,384 members, 860 on trial, and 4,355 pupils. Among the striking features of the work of the year were successful labors among the Italian navvies in the Simplon Tunnel; progress toward a self-supporting and self-governing church in Ceylon; revivals in South India; reconstruction and readjustment in China; improved conditions in South and West Africa; and beneficial legislation in the West Indies.

Wesleyan Conference.—The Conference met at Manchester, July 22. The Rev. John Shaw Banks, Professor in the Theological Institution, was chosen president. The following resolution was adopted concerning the education bill:

"The Conference once more declares that the primary object of Methodist policy in the matter of elementary education is the establishment of school boards everywhere, acting in districts of sufficient area, and the placing of a Christian unsectarian school within reasonable distance of every family. The Conference therefore deeply regrets that the present education bill is intended to destroy the school board system, and to make no adequate provision for the just claims of those parents who do not desire their children to be drawn into denominational schools. The Conference has no wish to abolish denominational schools, or to prevent them from being used with equitable restriction, for the purpose of giving denominational education to those children

whose parents desire it. But the Conference expresses once more its deep conviction that no increased grant from public funds should be made to denominational schools, unless that increased grant is accompanied by adequate and representative public management. If, however, denominational schools are to be almost wholly maintained from Imperial taxes and local rates, the 'irreducible minimum' of the rights of conscience and public justice demands that at least a majority of the local educational authority and of the governing committee of every school shall consist of publicly elected persons."

The Committee on the Twentieth Century fund reported that in payments more than £900,000 had been reached. About £880,000 were drawing interest (3 per cent.), and from this source nearly £35,000 had accrued. For the Methodist House in London, which formed part of the fund's program, the committee had entered into negotiations for the purchase of the Royal Aquarium premises at Westminster. A deposit had been paid, and, subject to the approval of shareholders (which was given before the close of the Conference), the Aquarium site, containing 100,000 square feet, would become connectional property before the ensuing February. The building to be erected thereon would include one large hall seating 3,000 persons, a smaller hall seating 1,000 persons, a large library, and many suites of rooms for connectional organizations. The attention of the Conference was occupied in a very large degree with the case of the Rev. Dr. Joseph Agar Beet, a professor in the college at Richmond of the Theological Institution, in which a question of heresy was involved. Dr. Beet had published a book entitled *The last Things*, in which he asserted that the doctrine of the natural immortality of the soul was not taught in the Scriptures; and while denying the doctrines of annihilation at death and of immortality in Christ alone, he held that the soul has a conscious existence after death and the souls of the impenitent exist in conscious suffering, but it is not taught that this continued existence is endless. The case had been before the Conference four years before, and was dropped on Dr. Beet's promising to withdraw the book. Since then he had published another book, *The Immortality of the Soul: a Protest*, in which similar views to those formerly objected to were advanced. He was charged before the Conference with having violated his pledge given at the Conference of 1898 to withdraw the book *The Last Things* by republishing the substance of it in another book, and with having published in the latter book doctrines contrary to the standards of the Church. The case was referred to a special committee, upon the report of which the Conference found, with regard to the first charge, that Dr. Beet had not kept the pledge given to the Conference in the sense in which it was generally understood. But the Conference recognized the great difficulty and perplexity in which he was placed at the time the promise was made, and while deeply regretting his action, regarded it as arising from a serious error of judgment rather than from want of good faith. In regard to the second charge, it was found that Dr. Beet "has published in the aforesaid book doctrines contrary to the standards of our Church (a) in exalting the moral sense to an authority in religious belief above Holy Scripture, (b) in regard to the immortality of the soul and the endless sufferings of the lost. In regard to (a) the Conference finds that though his language was unguarded and liable to misconception, and some passages of the book seem to place the moral

sense above Scripture as an authority in matters of religious belief, Dr. Beet has no intention of doing this, and he emphatically denies that there is any real conflict between the two. In regard to (b) Dr. Beet stated before the committee that in some small details his teaching contravened the teachings of our standards, but that it is in harmony with the general system of doctrine that underlies them. The Conference finds that Dr. Beet rejects as without foundation the doctrines popularly known as those of annihilation, conditional immortality, universal restoration, and probation after death, and maintains that though the Holy Scriptures teach that all our souls will survive death for a period to which no limit can be affixed, and that utter hopeless and final punishment will overtake the impenitent, they do not assert or assume the essential permanence of the soul, though neither do they deny this. And that, while the Holy Scriptures give no ground for hope that the agony of the lost will ever cease, they do not plainly and categorically assert its endless continuance. The above is the statement of Dr. Beet's views made at the Conference of 1898, and accepted by Dr. Beet before the committee as a statement of his present position. The Conference decides that this teaching falls short of and contravenes the doctrine held and taught in our Church. In regard to the whole case, in view of the dread solemnity and admitted mystery of the subject and the necessity of allowing some freedom of opinion upon it, and out of respect to the fidelity of Dr. Beet to our general system of doctrine, the Conference resolves that on condition that Dr. Beet does not teach in our pulpits the doctrine of this book, and that he publish no further upon the subject except with the consent of the Conference, the Conference will take no further action." The reelection of Dr. Beet as a professor in the Theological Institution was opposed on account of his position respecting these doctrines; but he was chosen, receiving 377 votes out of 577 cast. The home mission department reported a rising income; but the foreign mission report embodied a complaint that the contributions were stagnant, and the Church was in danger of being outstripped on the mission fields. A series of missionary conventions on a large scale was directed to be held during the coming year in London and 11 other of the more important cities.

VIII. Primitive Methodist Church.—The following is a summary of the statistics of this Church reported to the Conference in June: Number of traveling preachers, 1,048; of local preachers, 16,016; of class-leaders, 10,569; of members of society, 195,651; of Sunday-schools, 4,107, with 58,881 teachers and 450,396 pupils; of hearers, 589,784; of connectional chapels (home), 4,321; of other chapels (home), 632; value of church property (home), £4,019,239; debt on the same, £1,016,678. In Africa and New Zealand were 60 connectional chapels and 101 other chapels and rooms, and the value of the church property was £45,843, less debt of £9,564.

The General Chapel fund had granted during the year £783 toward reducing debts and £211 toward new erections, and had promised £2,200 additional. The Chapel Loan fund amounted to £12,313. The Legal Defense fund amounted to £271. The London Chapel Extension fund had received £191, and had granted £250 for the purchase of sites. The Church Extension fund had an income of £4,400, and had promised assistance to projects involving a cost of more than £150,000. The connectional fund returned an income of £11,563. The Superan-

nuated Ministers' Widows' and Orphans' fund had supported 315 annuitants, widows, and orphans, and returned an income for the year of £8,511. The Local Preachers' Aid fund reported an income of £1,139, showing an increase of £249, with 133 pensioners on the permanent list.

The annual meeting of the Primitive Methodist Missionary Society was held in London, May 12, the Rev. Thomas Whitehead presiding. The net income for the General fund had been £13,168, and the expenditure £13,649. The net income of the African fund had been £6,160, and the expenditure £7,772. The home missions returned a net increase of 224 members. Since the union of the Methodist Churches in Australia, the only colonial stations remaining in direct association with the English Conference were in New Zealand. The churches there exhibited a healthy and vigorous life. Reports were made of foreign mission stations in West Africa, where one of the centers had been disturbed by the declaration of the district as German territory; South Africa, where the station at Aliwal North, which had been seriously injured by the war, was regaining its normal conditions, and, with 1,173 members, constituted the largest church in the connection; and Central Africa, where the work was just in its beginning. The institution of the Church Extension fund had led to the creation of a number of new causes in suburban places, and the fund was cooperating in the erection of nearly 50 new buildings. The Sustentation fund had come under partial review during the year, and the inquiry was not yet complete.

The eighty-third annual Conference met in Hull, in June. The Rev. Thomas Mitchell was chosen president. The statistical returns showed the largest connectional increase the Church had known for many years. The committee which had been engaged in codifying the connectional regulations made an *ad interim* report, and was reappointed, with the addition of two new members. In the case of an appeal of a minister for compensation because he had been removed from one circuit to another without notice, while some hardship was admitted, the Conference insisted that it must maintain its absolute right to place its ministers where it will. A question arising concerning the recognition to be given to degrees conferred by colleges of no reputation, the matter was referred to the General Committee for inquiry, and it was determined that in the published Conference minutes there should be entered after each degree inserted the name of the institution from which it came. The organization of the Missionary Committee was modified; and instead of there being two committees, one meeting fortnightly in London, and the other quarterly at various centers, the quarterly meeting was made the General Missionary Committee, and an Executive Committee was constituted, of 19 persons, 8 of whom must be laymen, to meet monthly in London, and to be directly responsible to the quarterly committee. The unit of representation in the Conference was changed, to be in the future 1,000 members, instead of 3,000, as in the past, with no district to have less than 3 delegates. A petition was adopted for presentation to the House of Commons, showing that the members of the Conference were strongly of the opinion that the education bill before Parliament was fraught with great injustice to Free Churchmen and detrimental to the best interests of education and of the nation.

IX. Methodist New Connection.—From the reports made to the Conference it appeared that there had been an increase of about 1,200 mem-

bers at home, but a decrease in China brought down the net increase in the membership of the Church to 1,081. Through the Boxer troubles in China 288 candidates had been lost to the Church. A gain of 717 pupils in Sunday-schools was shown, and an increase of 278 pupils who are members of the Church.

The income of the Loan fund for the year had been £305, showing an increase of £38. Its capital had risen from £10,441 to £10,721. During the year 10 new loans had been issued to the amount of £1,450, and others to the amount of £2,570 had been sanctioned. Nearly £12,000 had been lent without interest in the last seven years. The Chapel Committee returned an income of £747.

The one hundred and sixth Conference met at Stockport, June 9. The Rev. Martin J. Birks was chosen president. The Committee on Church Union reported that the result of negotiations with the Irish Wesleyan Church with reference to union had been unsatisfactory. In response to the resolution concerning Methodist Union passed by the Methodist Ecumenical Council of 1901, the Conference declared that believing that union among the Methodist Churches in Great Britain would be of great advantage to the kingdom of Christ, it would be prepared to consider any practicable proposals for promoting that object; and authorized its Annual Committee to receive any communications that might be addressed to it from Methodist conferences or from committees especially directed to deal with the subject, to consider them, and to report to the Conference. The institution of a "Forward Movement" mission was approved of. The establishment of an order of deaconesses, with a training home, if it is found practicable, was sanctioned, and the Home Mission Committee was authorized to frame a workable scheme and suggest means for its support. An agreement with the Wesleyan Book-Room respecting the publication of a new hymnal adapted to the use of both Churches was approved.

X. United Methodist Free Churches.—The whole number of members of this body was reported at the Annual Assembly of 1902 to be 83,803, an increase of 2,555 from the previous year; number of ministers and missionaries, 381; of local preachers, 3,302; of leaders, 3,522; of teachers in Sunday-schools, 24,832; and of pupils, 192,572; showing an increase of 810 teachers and 2,602 pupils. The report of the book-room showed a profit of £310 on £5,678 of sales. The income of the Chapel fund had amounted to £521. The capital of the Loan fund stood at £13,836, and its outstanding loans amounted to £11,227. The subscriptions to the Superannuated and Beneficent fund had amounted to £526 from the churches and £1,124 from ministers. The demands on the fund were rapidly growing. The Fire Insurance Association had made a profit of £532, bringing up the capital to £3,910.

The Annual Assembly met at Leeds, July 8. The Rev. William Redfern was chosen president. Communications were read relating to the Methodist Union effected in Australia, and resolutions giving sanction to the measure, and which were needed to make it valid, were passed. The Charity Commissioners having in some instances claimed a degree of control over connectional property, the persons in charge were authorized to obtain the opinion of counsel if necessary. The education bill of the Government was condemned by a unanimous vote. The report of the Twentieth Century fund showed that the total amount promised was 104,516 guineas, a sum to which

increase by further contributions from foreign stations was anticipated. The committee of this fund and the Connectional Committee had jointly considered a scheme for Church extension which as adopted by the Assembly contemplates the allotment of one-third of the missionary income to this work; the appointment of a subcommittee of the Connectional Committee acting under its supervision for administering the money allotted for home mission work; the determining of grants for ministerial purposes to home mission churches, dependent circuits, and extensions; and the oversight of stations receiving help. The portion of the Twentieth Century fund allotted for Church Extension purposes is to be administered by the Chapel Committee in conjunction with the treasurers and secretary of the Twentieth Century fund, who will be *ex officio* members of the committee. An Advisory Committee was constituted to consult with churches intending to erect new buildings. In view of the expressions of the Ecumenical Methodist Conference of 1901 in favor of Methodist union, the Assembly again expressed unanimously, "as on former occasions, its strong conviction that such union is greatly to be desired. As our denomination is a practical illustration of the advantages of union, this Assembly can not be otherwise than favorable to the increased unification of the Methodist Churches. It, however, realizes that to secure so desirable an end mutual concessions must be made, and that such concessions should be consistent with ecclesiastical freedom and representative government. Should the present state of opinion on church government make it impracticable for all sections of Methodism to unite, those that are nearest to each other in their foundation principles might make, as a first step, approaches, in the hope that in the future 'the people called Methodists' may form one organization. With this view the Assembly is prepared to consider any practicable proposals in favor of union." A scheme for carrying out evangelical education and industrial work in East Africa was adopted.

XI. Bible Christian Church.—The Bible Christian Conference met in Forest Hill, London, July 30. The Rev. John Dale was chosen president. It was remarked on comparing the statistical tables that the numbers in the Church were no larger than fourteen years ago, but rather less. The failure to advance was satisfactorily accounted for by reference to the deductions which necessarily followed the setting off of the colonial conferences that they might enter the union of the Methodist Churches in their respective colonies; thus the Churches of New Zealand had united with the Wesleyan Methodists in 1897; those of South Australia with other Methodists in 1900-'01; and those of Victoria during the past year. The deductions to be made in consequence of the transfer of churches aggregated 77 ministers, 400 local preachers, 370 chapels and preaching places, 7,530 members of society, 1,848 teachers, and 15,576 pupils in Sunday-schools. The steady advance at home, however, would at the present rate carry the total in each department of the tables beyond the figures of 1896, the year before the New Zealand loss. The New Century fund had been brought within £500 or £600 of the amount of £25,000 contemplated at the outset. A resolution was passed denouncing the education bill and warning the Government that "a large number of our people will not consider the bill, if carried into law, as entailing any moral obligation upon them to obey it." Concerning Methodist union, the Conference declared its judgment "that the union of all the Methodist

Churches in this country on a just and honorable basis is a consummation eminently desirable in itself, and an important step toward the closer union of all the evangelical churches in this country, and we therefore resolve to embrace every opportunity afforded us for interdenominational fellowship and mutual cooperation. This Conference is further of opinion that in the meantime it ought to be possible for the Methodist Churches which hold substantially the same views of the pastoral office and the mutual rights and relations of ministers and laymen to at once unite for the sake of economy and greater efficiency in working, and in the event of any proposals to this end being received from any one or more of these Churches, we once more affirm our willingness to seriously consider them, following in due course with corresponding action, provided, as an essential condition, preliminary inquiries show that a satisfactory basis of union is likely to be formulated, and that there is a determination, if negotiations be once commenced, that they shall, if possible, be conducted to a successful issue." Further, the Conference unanimously directed, that in the event of any overtures being received from the Connectional Committee or Conference of any Methodist Church in the country on the subject of union, the Connectional Committee be authorized to consider the same, "taking care not to commit the Connection in any way to organic union until the whole matter has been reported to the annual conference and a decision has been taken to that effect." The Conference also acted favorably upon a proposal of the Joint Committee of the Methodist Churches for concerted action suggesting the designation of a deputation to visit each Methodist conference or assembly.

The annual meetings of the Bible Christian Missionary Society were held in London, May 6. The report showed that 52 ministers were engaged in the home work, with 250 local preachers, 4,512 church-members, 331 junior members, 931 teachers, and 3,046 scholars, and that 72 members had been added during the year. In the foreign field there were in China 11 missionaries, 28 full members, 22 on trial, and 150 scholars. The treasurer's report showed that the society was £835 in debt. Three-quarters of the Century fund had been paid in.

XII. Wesleyan Reform Union.—The fifty-fourth annual Conference of the Wesleyan Reform Union met in High Wycombe, Aug. 2. The Rev. Edmund Bromage was chosen president. The statistical report showed that there were connected with the Union 192 chapels and preaching places with 45,111 sittings, 406 preachers, 73 preachers on trial, 347 class-leaders, 7,374 members, and 475 members on probation. An increase of 5 Sunday-schools was reported. The connectional Endeavor Societies returned 2,440 members. The sum of £3,931 had been spent in chapel improvement. The Jubilee Thanksgiving fund had been brought up to a total of more than £1,750, or within £250 of the amount of £2,000 aimed at. A resolution condemning the education bill was carried unanimously. The Conference by resolution expressing the opinion that the time had now arrived when some definite action should be taken to ascertain the opinion of the various branches of the Church upon the subject of Methodist Union, a commission was appointed "to attend any joint conference for the purpose of a frank and friendly discussion, and, if possible, for the finding of some basis of action." A report was made that the Union had now a sum of £139 subscribed for missions, and that a general in-

terest in the subject was manifest throughout its bounds. The Conference authorized the training and sending out of a suitable person into the foreign mission field, through the medium of the China Inland Mission, and directed the General Committee to take immediate steps to consider the claims and fitness of possible candidates. A secretary was appointed in the interest of the Endeavor Societies.

MEXICO, a federal republic in North America. The legislative power is vested in the Congress, consisting of a Senate and a House of Representatives. There are 56 Senators, 2 for each of the 27 states and the federal district, and 227 members of the House of Representatives, 1 to 40,000 inhabitants, elected for four and two years respectively by the votes of all adult male citizens of respectable character. The President is elected for four years by a college of electors. In case of his disability Congress has authority to elect an acting President who shall discharge his duties until his recovery, or until the close of the presidential term if the disability is permanent. The President of the republic is Gen. D. Porfirio Diaz, reelected for the fifth time on July 9, 1900. The Cabinet was composed at the beginning of 1902 as follows: Secretary of State for Foreign Affairs, I. Mariscal; Secretary of the Interior, Gen. M. Gonzalez Cosio; Secretary of Justice and Public Instruction, J. Fernandez; Secretary of Public Welfare, Colonization, and Industry, L. Fernandez; Secretary of Finance and Public Credit, J. I. Limantour; Secretary of Communications and Public Works, Gen. F. Z. Mena; Secretary of War and Marine, Gen. Bernardo Reyes; Treasurer, E. Loeza.

Area and Population.—The area of the states and territories and their population at the census of Oct. 28, 1900, compared with the population at the census of Oct. 20, 1896, are stated in the following table:

STATES.	Square miles.	POPULATION.	
		1895.	1900.
States:			
Tamaulipas	32,128	206,342	218,948
Vera Cruz.....	29,301	368,892	960,570

Chiapas.....	27,222	318,730	363,607
Territories:			
Lower California.....	58,328	41,838	47,082
Tejic.....	11,275	146,805	149,677
Federal district.....	463	468,705	540,478
Islands.....	1,420
Total.....	767,005	12,491,573	13,545,462

The population comprised 6,716,007 males and 6,829,455 females in 1900. The whites constituted 19 per cent. of the whole, persons of mixed blood 43 per cent., and Indians 38 per cent.

There were 1,908,707 Indians in 1895 who could not speak Spanish, and 2,034,712 who habitually spoke the native Indian languages. The number of foreigners in 1895 was 50,888, of whom 13,962 were Guatemalans, 12,859 Spaniards, 11,331 citizens of the United States, 3,599 French, 2,450 British, 2,155 Germans, 1,932 Italians, 1,197 other Europeans, 993 Asiatics, and 408 South and Central Americans. The number of marriages recorded in 1898 was 61,687; of births, 489,933; of deaths, 452,328. Registration has been lax, and in 1898 it was made a condition of the recognition of children as legitimate.

Finances.—The total receipts of the federal treasury for the year ending June 30, 1901, amounted to \$63,283,196 Mexican, and expenditures to \$59,423,006. For 1902 the revenue was estimated at \$62,290,000, and expenditure at \$62,275,102. The budget for the year ending June 30, 1903, makes the total receipts \$64,823,600, of which \$29,228,200 are derived from import and export duties, \$25,739,000 from stamps, etc., \$3,524,000 from posts and telegraphs, \$3,443,000 from direct taxes, and \$2,889,400 from various sources. The expenditures for 1903 were estimated at \$64,738,816, of which \$1,145,985 are for the legislative power, \$308,273 for the executive power, \$426,908 for the judiciary, \$688,935 for foreign affairs, \$5,151,422 for the interior, \$3,218,621 for justice and education, \$996,266 for public welfare, \$9,214,191 for public works, \$29,304,265 for finance, and \$14,283,950 for war and marine. The foreign commercial exchanges have been so disturbed by the depreciation and fluctuations of silver that in 1902 the Government gave permission to the banks to keep accounts with their customers in either gold or silver and convert silver credits into gold or gold credits into silver at current rates. The banks have accumulated gold reserves against their gold liabilities. The Government contemplates adopting the gold basis. The revenue for 1903 is estimated at \$67,959,000, and expenditure at \$67,597,000. The surplus of 1902 was \$3,000,000 and the accumulated surpluses amounted to \$26,000,000 in silver and over \$3,000,000 in gold.

The federal debt in 1901 amounted to \$109,475,000 payable in gold, consisting of a 6-per-cent. loan of \$50,845,000 obtained in 1888, one of \$29,763,000 contracted in 1890, one of \$14,970,800 contracted in 1893, and 5-per-cent. bonds of the Tehuantepec Railroad dating from 1889; consolidated 3-per-cent. bonds payable in silver amounting to \$51,000,000, redeemable internal bonds paying 5 per cent., and railroad bonds payable in silver, making a total silver debt of \$135,509,271, besides a floating debt of \$1,296,965.

Each state elects a Governor, Legislature, and judicial officers to enforce its separate laws and has power to levy taxes, but not to impose duties on the products of other states. The budgets of the 27 states in 1899 amounted to the sum of \$19,952,534 for receipts and \$19,695,936 for disbursements.

The standard of value is the Mexican dollar containing 24.440 grams of fine silver. From 1821 up to June 30, 1900, the Mexican mints coined \$1,396,273,190 in silver, \$59,285,530 in gold, and \$6,585,520 of copper and \$2,744,000 of nickel coins.

The Army and the Navy.—The strength of the army in 1900 was stated to be 32,143 men, including 2,068 officers. The infantry numbered 1,314 officers and 21,291 men; cavalry, 566 officers and 6,683 men; artillery and train, 188 officers and 2,101 men. In the cavalry are included 261 rural guards and 118 gendarmes. The infan-

try are armed with Mauser rifles of 7 millimeters caliber, the cavalry with carbines of the same system, the artillery with Bange field-pieces of 7.9 centimeters caliber and Gruson mountain guns. The war strength is estimated at 60 generals, 3,400 other officers, 120,000 infantry, 20,000 cavalry, and 6,000 artillery. Every Mexican between the ages of twenty and fifty is liable to military service in case of war.

The naval force consisted in 1901 of the despatch steamers *Democrata* and *Mexico*, of 450 tons each, dating from 1875; the gunboat *Independencia* and *Libertad*, each of 425 tons, about as old; and the school-ship *Zaragosa*, of 1,200 tons, built in 1891. An armored river gunboat has been ordered; and 5 first-class torpedo-boats, an armor-clad vessel, 2 cruisers, 4 gunboats, and 2 transports were authorized to be built. The Tampico and Vera Cruz, small gunboats, were launched at Elizabeth, N. J., in 1901, and work was begun on 2 cruisers of 1,800 tons.

Commerce and Production.—The production of corn in 1899 was 32,927,278 hectoliters; of wheat, 252,720 metric tons; of rice, 23,103 tons; of beans, 3,288,847 hectoliters; of sugar, 68,607,652 kilograms; of panocha, 59,189,362 kilograms; of molasses, 62,076,460 kilograms; of spirits, 1,117,877 hectoliters; of cotton, 22,487,517 kilograms; of henequen, 118,878,440 kilograms; of logwood, 45,422,946 kilograms; of cacao, 1,032,437 kilograms; of coffee, 37,609,264 kilograms; of tobacco, 7,868,767 kilograms; of fermented liquors, 6,550,206 hectoliters. In the five years from 1894 to 1898 inclusive titles of 1,818,657 hectares of land were granted to companies which surveyed and mapped public lands, receiving a third of all they surveyed; settlers from 1893 to 1898 inclusive acquired titles to 756,592 hectares, and 476,141 hectares were sold from 1894 to 1898 inclusive; colonists from 1896 to the end of 1899 received 2,360 hectares. There were 13 agricultural settlements, containing 3,926 colonists, which the Government established, and 12, with 3,926 members, were founded by colonizing companies and private individuals.

There were 1,142 mines worked in 1899, of which 84 produced gold, 278 gold and silver, 117 gold and other metals, 256 silver, 171 silver and lead, 114 silver and other metals, 34 zinc, 34 copper, 7 copper and iron, 20 lead, 6 lead with zinc and iron, 40 antimony and cinnabar, 7 sulfur, tin, and graphite, and 425 were not yet productive. The value of ores produced was \$89,044,000. The number of workers was 106,536, including 1,288 women and 5,852 children. In the year ending June 30, 1899, the quantity of gold presented at the mints and assay offices was 5,986 kilograms, valued at \$4,043,374; of silver, 1,417,216 kilograms, valued at \$57,985,400; total value, \$62,028,774. In addition to this there were exported 5,066 kilograms of gold, value \$3,421,700, and 952,939 kilograms of silver, value \$38,989,491; total value, \$42,611,191. There were 2,211 distilleries in 1899, producing 864,858 gallons of spirits. There were 118 cotton factories, with 468,547 spindles, 13,944 looms, and 27 machines for printing calico, consuming 57,201,573 pounds of cotton and producing 3,795,446 pounds of yarn and 9,875,764 pieces of cloth. The number of tobacco factories was 721, and these worked up 5,546,567 kilograms of tobacco.

The total value of imports in the year ending June 30, 1901, was \$65,083,451 in gold. The value of exports of merchandise in 1900 was \$79,031,336 Mexican; of precious metals, \$71,025,024; total exports, \$150,056,360 Mexican in 1900 and \$148,656,338 in 1901. The exports of mineral products

in 1901 were \$97,924,498 in value, against \$84,988,572 in 1900; of vegetable products, \$36,149,110, against \$50,939,474; of animals, \$11,495,129, against \$10,633,713; of manufactured products, \$2,395,044, against \$2,813,687; of miscellaneous products, \$692,557, against \$680,914. The bulk of the trade in the year ending June 30, 1901, was distributed among different countries as follows:

COUNTRIES.	Imports.	Exports.
United States.....	\$85,165,253	\$117,236,328
Great Britain.....	9,934,685	12,063,077
Germany.....	7,084,742	5,018,464
France.....	6,564,108	2,894,308
Spain.....	2,876,743	1,187,714

The imports at the port of Vera Cruz in 1901 were \$22,328,154 in gold, and exports \$21,892,184 Mexican; imports at the port of Tampico were \$9,712,956 gold and exports \$43,880,140 Mexican.

Navigation.—The number of vessels engaged in foreign commerce entered at Mexican ports during 1900 was 1,541, of 2,245,166 tons; in the coasting-trade, 7,364 vessels, of 4,425,263 tons. The merchant marine, including small coasters, consisted of 17 steamers, of 3,961 tons, and 50 sailing vessels, of 8,445 tons.

Railroads, Posts, and Telegraphs.—The length of railroads in operation in 1901 was 9,600 miles. The Tehuantepec Railroad from Coatzacoalcas on the Gulf of Mexico to Salina Cruz, on the Pacific, 190 miles, completed as a Government undertaking in 1893 at a cost of \$27,000,000 Mexican, has been operated at an annual loss of \$2,500,000. In 1897 the line was leased to an English firm, which with the aid of a subsidy of \$5,000,000 has improved both harbors, established a line of steamers to England, and equipped the railroad for a large interoceanic traffic.

The post-office in 1901 handled 148,086,513 letters and postal cards; receipts, \$2,135,570; expenses, \$5,638,512.

The telegraphs in 1900 had 42,843 miles of line, of which the Federal Government owned 28,560 miles; number of despatches, 2,604,711. The length of telephone-lines was 18,955 miles.

The Yaqui War.—The Mexican Government in a guerrilla warfare which has lasted twenty-four years, with only two intermissions of two years, has not yet subdued the Yaqui tribe in northern Mexico. In 1902 the war was waged more relentlessly than at any previous time. The Yaquis rebelled immediately after Mexican independence in 1821, and whenever the Mexican authorities attempted to impose their jurisdiction a war resulted. The last long war was broken by the peace signed at Ortiz in 1897, but the Indians again renewed hostilities as soon as they had repaired their strongholds, and since then 3,000 Mexican soldiers have been kept busy in a final effort to reduce the tribe to submission. The Yaquis are such brave and able fighters that a band of 40 or 50 will hold off several times as many Mexican soldiers. In 1901 they lost several hundred braves, and in the first half of 1902 their losses were still heavier. In a skirmish that occurred in July in Sonora near Turin 35 of them were killed, while the Mexicans lost only 5 men. When beaten they hide themselves in the mountains where the troops of Gen. Torres can not penetrate. Their hatred of whites dates from the time of the Spanish conquest, when they were subjected to frightful cruelties, and yet were not conquered. From 180,000, the estimate of their number at that time, they were reduced to 35,000 in 1821, five of their pueblos having been destroyed by the Spaniards during three centuries

of warfare. They fought bravely in the army of Gen. Iturbide for Mexican independence, and when left to themselves they prospered and increased, raising grain and working silver- and copper-mines. The copper-mines, the best in Mexico, in the course of the last war were seized by the Mexican Government and now belong to American companies. The cession of a part of their lands to the United States in 1848 by the peace of Guadalupe Hidalgo was the first of their grievances against the Mexican Government, and many others have arisen since. In the resulting war the property of the tribe and thousands of warriors have been sacrificed and over 20,000 Mexican soldiers have fallen in battles and skirmishes in eastern Sonora and northern Chihuahua. The women worked to earn money to provide arms and ammunition, made powder and bullets, defended the mountain passes, and sometimes fought in the regular battles. In the beginning the Yaquis were oftener successful than the Mexicans. The Yaquis formally rebelled against the Government and asserted their independence in 1878, and Gen. Cajemi, their Governor, took command of the rebel army, which for seven years held the mountain strongholds and passes against 5,000 Mexicans under Gen. Pesqueira. Two years after Cajemi was shot the defensive war was continued. When the Mexicans at last penetrated their country and cap-

and Chihuahua. Before the end of 1898 the Yaquis again declared war, on the ground that the Government took away their boys and girls from the reservations to be educated in Government schools. An attempt was made in July, 1902, to surround and capture about 150 braves in the San Mateo foothills by the stealthy advance of several columns. The Indians learned of the movement, slipped into the valley before the advance, and after strangling the sentries massacred one column in the darkness, and bound the officers to trees before an alarm could be raised. Their boys become sharpshooters at sixteen and all are provided with Winchesters. In order to cut off supplies from the strongholds and prevent boys from joining the fighters the Government in August, 1902, decreed that every Yaqui of either sex, whether living in the pueblos or working on ranches, must be treated as a prisoner of war. Then men are put in chain-gangs at Hermosillo, the women and children sent to a reservation in southern Mexico, the boys placed in a military school at Vera Cruz to be trained for the Mexican army.

MONACO. The principality of Monaco is an *enclave* in the department of the Alpes Maritimes,

MONACO.

tured their mines their bands began to raid the surrounding country, and women and non-combatant men and boys went out to earn in mines, ranches, and fisheries the means of keeping up hostilities. The peace of Ortiz was brought about by the mediation of American miners in Sonora

with a front on the sea. The reigning prince is Albert, born Nov. 13, 1848, who succeeded his father, Charles III, on Sept. 10, 1889. The area of the principality is 8 square miles and the population is 15,180, of whom 3,292 are in the town of Monaco and 3,794 in the town of Monte

Carlo. A Governor-General, G. M. Olivier Ritt, is at the head of the administration. The Prince has a guard of honor and there is besides a military force of 5 officers and 70 men and 50 gendarmes. Olive-oil, oranges, lemons, perfumery, liqueurs, and artistic pottery are exported. The revenue is derived mainly from the gambling-house at Monte Carlo. A syndicate obtained the concession for fifty years in 1863, paying 1,250,000 francs a year. In 1898 an extension till 1947 was obtained, the company agreeing to pay 10,000,000 francs in 1899 and 15,000,000 francs in 1907, and to increase the annual payment to 1,750,000 francs in 1907, to 2,000,000 francs in 1917, to 2,250,000 francs in 1927, and in 1937 to 2,500,000 francs. The estimated receipts of the company for the year ending March 31, 1900, were 23,750,000 francs, of which 23,000,000 francs came from the gaming-tables and 750,000 francs from hotel and *café* rents. Besides the annuity of 1,250,000 francs paid to the Prince of Monaco, the company paid 2,500,000 francs for renewal of the concession, 500,000 francs for government and police, 250,000 francs for lighting, 250,000 francs for the bishop and clergy, and 900,000 francs for other expenses for the principality; total, 5,650,000 francs. The expenditure on the Casino was 6,100,000 francs, including 2,500,000 francs for cost of management, 250,000 francs for repairs, 750,000 francs for newspaper subventions, 2,000,000 francs for the theater and orchestra, and 600,000 francs for other expenses. The balance to be divided among the stockholders was 12,000,000 francs, 40 per cent. on the capital stock, which is 30,000,000 francs.

MONTANA. (See under UNITED STATES.)

MONTENEGRO, a principality of the Balkan peninsula. The reigning Prince is Nicholas I, born Oct. 7, 1841, nephew of Danilo I, whom he succeeded on Aug. 14, 1860. The heir apparent is Danilo Alexander, born June 29, 1871. The legislative power is vested in a State Council of 8 members, of whom 4 are nominated by the Prince and 4 are elected by the male inhabitants who bear arms or have borne arms. The President of the Council of Ministers is Voivode Bojo Petrovic.

The area of Montenegro is estimated at 3,630 square miles, the population at 228,000. The budget for 1902 shows a revenue of 250,000 florins from the land tax, 360,000 florins from customs, 150,000 florins from monopolies, and 440,000 florins from other sources; total, 1,200,000 florins. Expenditures were estimated at the same, including 137,000 florins for the civil list, 90,000 florins for administration and justice, 50,000 florins for education and worship, and 58,000 florins for the army and police. The debt amounts to 960,000 florins. All young men capable of bearing arms are trained for the army, except Mohammedans, who pay a military tax. The strength of the army is 35,870 infantry and 856 artillery. The chief products are corn, tobacco, oats, potatoes, barley, buckwheat, wine, olives, hides and skins, wool, cheese, insect powder, smoked sardines, honey, and beeswax. The value of imports in 1898 was 1,405,580 florins, and of exports 1,179,960 florins. The merchant navy consisted in 1900 of 17 sailing vessels, of 3,772 tons. A concession has been granted for iron-mining, and a railroad from Antivari to Niksic, 100 miles, will transport the ore. There are 400 miles of telegraph-lines.

MORAVIANS. The statistics of the Moravian Church, published officially in July, 1902, give the following numbers for the "home provinces." In the European or German Province 23

congregations, 7,772 members, and a net increase of 38 members reported for 1901. Connected with this province are Bethel, Australia, 258 members; Russia, 30 members; and the Diaspora missionaries and their children, 90; making a total for the province and its affiliated members of 8,150.

The British Province, divided into 5 districts, with 42 congregations, returns 3,458 communicants, a total membership of 6,058, and 5,461 members and teachers in Sunday-schools.

The American Province, North, divided into 5 districts (including that in Alberta, Canada), consists of 88 congregations, and returns 12,526 communicants and a total membership of 18,529. The American Province, South, consists of 3,247 communicants and a total of 5,367; making the whole number of communicants in the two American provinces 15,773, and the entire number of persons connected with the churches 23,896.

The missionaries in foreign fields, with their children, number 450. The total number of members in the "home province" is 39,280. Further, at the close of 1900, the number of communicants in the various missions was 32,028, and the total of people under the care of the missionaries was 96,877.

The statistical tables of the Moravian Church in the United States for 1901 give it—in the Northern district, 12,526 communicants, 1,238 non-communicant members, and 4,765 children, making a total membership of 18,529; 10,021 pupils and 1,182 officers and teachers in Sunday-schools; in the Southern district, 3,247 communicants, 285 non-communicants, 1,835 children, a total membership of 5,367; 3,704 pupils and 347 officers and teachers in Sunday-schools; total for the Church in America, 15,773 communicants, 1,523 non-communicants, 6,600 children, making a total membership of 23,896; 13,725 pupils and 1,529 officers and teachers in Sunday-schools. The numbers show an increase during the year of 548 communicants, 429 in the total membership, and 19 officers and teachers in Sunday-schools, and a decrease of 107 non-communicants, 12 children, and 18 pupils in Sunday-schools. The total contributions and expenditures in the Northern district were \$130,536, and the total contributions for Church enterprises were \$30,557; showing an increase over the previous year of \$2,738 in contributions for Church support, and \$1,382 in those for Church enterprises. The contributions for Church enterprises included \$1,955 for retired ministers, \$1,519 for the Bohemian Mission, \$8,245 for foreign missions, \$3,302 for the Alaska mission, \$8,093 for home missions, \$5,468 for the theological seminary, \$988 for all other Moravian causes, and \$986 for general Christian objects.

The summary of gifts of the Moravian Church, North, for all foreign mission and other benevolent causes passing through the hands of the provincial treasurer for 1901 gives a total footing of \$33,444, and shows an increase over the total for 1900 of \$4,897. The average contribution per communicant was \$2.70; in 1900 the average was \$2.42. The gifts for foreign mission causes were \$14,376; for home missions, \$4,313; for the theological seminary, \$2,668; for retired ministers, \$2,735.

The forty-fifth anniversary of the Moravian Historical Society was celebrated at Nazareth, Pa., Sept. 9, Bishop Levering presiding. The report gave the number of members of all kinds as 335, and showed how interest in the early history of the Church in America had been awakened and research among archives stimulated by the influence of the society. The collections of documents and relics were increasing and becoming

valuable, and much interest was taken in marking sites associated with the history of the Church. Papers were read on the circumstances under which the society was called into existence, accounting, among other things, for the simple vesper supper which is one of the features of the anniversary meetings; Early Mission Work among the Cherokees of Georgia; and "The Graveyards of Nazareth," in one of which some of the first refugees from Bohemia and Moravia are buried.

The synod of the British Province met in London, Aug. 5. Among the subjects considered were the relation of the British Province to the foreign mission work of the Church; home missions and evangelistic efforts; and the salaries of the ministers of the province. With the view of securing an increase in the number of missionaries sent out by the province, steps were determined upon for the proper preparation of candidates for missionary service, and for the publication of tracts and pamphlets intended to stimulate interest in and furnish information concerning missionary work.

MOROCCO, an empire in northern Africa. The Emperor is an absolute monarch, ruler in temporal and spiritual affairs, deferring occasionally in religious matters to the Sharif of Tafilet and often in civil affairs to his Grand Vizier or Chamberlain. The reigning Emperor is Mulai Abdul Azizi, Sultan of Fez, Tafilet, Marakesh, and Sus, born Feb. 24, 1878. The grand vizierate was vacant in the beginning of 1902. The Minister of Foreign Affairs was Abdelkrim ben Sliman; Minister of War, Kaid el Mehedi el Menebbhi; Minister of Finance, Mohammed Tasi; Grand Chamberlain, Driss ben Aich; Representative of the Sultan for Foreign Affairs at Tangier, Hadji Mohammed ben el Arbi el Tores.

The boundary of Morocco in the Sahara is not settled. The area of the empire is supposed to be about 219,000 square miles, with 5,000,000 inhabitants or more. The population has been estimated at 9,250,000, comprising 3,000,000 Berbers and Tuaregs, 2,200,000 Shellah Berbers, 3,000,000 Mued Arabs, 700,000 wandering Bedouins, 150,000 Jews, and 200,000 negroes. There are about 6,000 Christians, of whom 5,000 reside in Tangier. Fez, the northern capital, has about 140,000 inhabitants; the city of Morocco, the southern capital, 40,000; Tangier, the seaport on the Mediterranean, 30,000. The Sultan's army consists of 3,000 Askari infantry trained by a British soldier; a negro guard of 3,000 cavalry; 8,000 Mekhazni, a species of mounted police; 800 artillery under French officers; and the tribal levies which in case of war would give 40,000 or 50,000 irregular cavalry and infantry. The Sultan's revenue, derived from tithes, taxes, monopolies, and presents, is believed to be about \$2,500,000. The value of the imports in 1900 was estimated at £1,634,676 sterling, including coin and bullion; exports, £1,767,075. The value of cotton goods imported was £698,130; sugar, £342,629; tea, £102,508. Exports of almonds were £332,849 in value; wool, £184,600; eggs, £171,119; beans, £154,595; goatskins, £126,368; wax, £88,153; hides, £41,710; olive-oil, £27,851; bird-seed, £25,870; sheepskins, £23,545; gum, £22,157. The tonnage entered at the ports of Morocco in 1900 was 1,007,374 tons. The crops were so good in 1902 that the Sultan suspended the law prohibiting wheat exports for one more year and reduced the export duty by a third.

Political Affairs.—In January, 1902, a special mission accompanied the British minister, Sir Arthur Nicholson, to the court of the Sultan at Marakesh, the southern capital. French influ-

ence was strengthened by the removal of difficulties relative to the Algerian frontier and the assurance that France had no designs on the oasis of Figig, where the Sultan proceeded to levy taxes on sheep and palm-trees for the first time. The French military mission at the Moorish capital was increased by artillery officers detailed to instruct native soldiers in the handling of field-guns that the French Government presented to the Sultan. France concluded a protocol delimiting the territories in the southern part of the empire beyond the line laid down in the treaty of 1848 and determining the zones in which the tribes assigned respectively to France and to Morocco were to live. Raiders from the Moorish oases killed two French officers, and whenever Frenchmen visited Figig they were liable to attack. A Franco-Moorish commission carried out the delimitation in the spring. Work on the French Sahara Railroad was stopped at Wad el Hassi in the expectation that instead of the original route the French could obtain the Sultan's consent to an oblique line approaching nearer to Figig. He consented to its extension beyond Figig to Djennan Edelar, causing anxiety to the rivals of France who fear the extension of French commerce and French political influence through this railroad confining Morocco on the southeast. An arrangement for keeping order in Figig was made between Morocco and France in July, 1901. In February, 1902, the Moorish Governor, military commander, and frontier commissioner, Si Mohammed Guebbas, arrived with a force of regular soldiers, accompanied by Gen. Cauchenez, the French commissioner appointed under the agreement for two years, who had a strong force at the neighboring French military post. Moorish and French companies of soldiers marched side by side after the commissioners to impress upon the natives the reality of the arrangement by which the troops will cooperate in repressing lawlessness and the commissioners of the two governments will decide frontier disputes in consultation. So long as the Sultan's representative had to depend on a local force Frenchmen were frequently assassinated and bands raided the country on the French side of the border as well as on the other, finding in Figig a safe asylum whither the French could not pursue them. A French consul has been installed in Figig and in the regions beyond a system of common policing has been adopted for the prevention of frontier incidents. A Moorish embassy was sent to Paris and St. Petersburg. The Sultan arrived at Fez on March 15, in time to celebrate the Id el Kebir festival on March 20 and to receive on March 27 the tribute of cattle, produce, and manufactures levied three times a year. The Sultan had set out from Morocco city at the beginning of the month and tarried at Rabat and Mekinez. Mulai Abdul Aziz, who came to the throne at the age of fourteen, had nothing to do with affairs of state while the despotic Vizier Sid Ahmed was alive and ruled the country with an iron hand. The young Sultan assumed control at the age of twenty. He soon displayed progressive tendencies and a reforming spirit. He sought advice from Europeans and fell in with the schemes of reform which the foreign representatives in rivalry urged upon his consideration, showing keen sensitiveness to European public opinion. The corrupt system by which the higher officials sell offices and extort contributions from those lower in rank down to the local sheikhs who prey upon the people he determined to reform. He interested himself in the workings of constitutional

government and in educational systems abroad and desired to keep on good terms with the powers. He took pleasure also in automobiling and surrounded himself with modern inventions and the conveniences of civilized life. His father had exhibited liberal tendencies in the early part of his reign, but although an autocrat of energetic character, he gave up the idea of revolutionary reforms repugnant to the official class and the fanatical element. The son was more

their Arab neighbors. For seven years the court had been absent from Fez and they had gone untaxed and ungoverned. The rising began in the usual way with robbing of caravans and pillaging of Arab villages. When the harvest is garnered it is no uncommon occurrence for them to indulge their pugnacious instinct by engaging in intertribal fights, and only at long periods will their unrest manifest itself in open and united defiance of the Government. There

TANGIER—VIEW FROM THE EAST.

helpless because he had not the means to keep up a strong military force, and was even obliged to dispose of some of his jewels to maintain his state. After his arrival at Fez the Sultan showed civilities to the foreign consuls and European officers and engineers in his service such as had never before been extended to Christians. He carried out his promise to reform the prisons in Fez. Overcrowding, bad sanitation, fetters, and cruel punishments were done away with, and, as the result of inquiries into the causes of incarceration, many prisoners were set free. An expedition of 2,200 Moorish soldiers, accompanied by a Spanish officer, marched from Tangier in January to punish the Beni Mesara Kabyles and recover Spanish children abducted by them. By arrangement French and Spanish squadrons anchored in Tangier harbor. The expedition was reinforced by 4,000 infantry and cavalry and many guns. The Beni Mesaras were brought to submission, and the troops proceeded to chastise the Beni Aros, to whom the robbers fled with the kidnaped girls, who were not rescued, although the campaign lasted three months, but the lawless tribes were subjugated.

Rebellious Uprisings.—In the summer the Berber tribes in the country surrounding Mekinez broke out in one of their periodical insurrections against the rule of the Arabs. They are of the pure Hamitic stock, speaking the distinct Shilha language, and are habitually hostile to

is always a disorderly element addicted to robbery when an opportunity is offered. The first attacks on caravans by Beni Metir and Geruan tribesmen were allowed by the Government to go unpunished, and when the attacks became frequent the Mekinez traders and Arab villagers retaliated by burning the stacks and seizing the cattle of the Berbers. The Government hesitated to employ troops against the Berbers because the soldiers when sent to restore order proved as lawless as they. The disorders thus grew with impunity until toward the end of August, when the Berbers had repeatedly raided up to the walls of Mekinez, despite the reinforcement of the garrison by 1,000 men, and a band of several hundred mounted men entered and plundered the cattle market. Sid Mohammed el Amarani, the Sultan's uncle, then brought reinforcements and Maxim guns from Fez, and attacked the Berbers in front while Arab tribes on the north fell upon the villages of Geruan from the opposite quarter. The troops, infantry for the most part, who could not come within fighting distance of the Berber horsemen, were disorderly and unmanageable, and committed the blunder of looting and burning the Beni Metir villages. This, the most powerful tribe, although members of it had robbed caravans, still remained loyal to the Government and sent levies to fight for the restoration of order. Now the Beni Metir Berbers joined those of Geruan and Zimmur in the rebellion. Their con-

tingent of soldiers deserted on Sept. 25 and burned Arab villages near the town that were still left standing. The country was already devastated, the Arab farmers having fled northward. In the town the riotous soldiery, between 3,000 and 4,000 in number, were as dangerous as the rebels, robbing by wholesale and murdering those who defended their property. The commanders were so jealous that no two of them would take part in the same action. In this perilous situation, while the Berbers held all the roads and had burned the Government granaries within the outer wall, the Zimmur and Geruan chiefs unexpectedly on Sept. 26 came under a flag of truce to seek peace. They were ready to make absolute submission and to make good all damage they had done and pay any fine or suffer any punishment that the Sultan ordered. While negotiations were proceeding they were interrupted on Oct. 15 by an attempt of 500 Zimmur tribesmen to capture the camp of the Government troops by surprise. Failing in this, they sought shelter with the other tribes, and when this was refused, they surrendered. While the Sultan's troops occupied their country all the rebel chiefs went to Fez to make their submission to the Sultan.

On Oct. 17 a fanatic who had come to Fez from the neighboring Udaya tribe with the set purpose of killing a Christian, murdered Dr. David J. Cooper, a British medical missionary. Although he was a Sharif, or descendant of the Prophet, and although he took sanctuary, the

be stabled in the university building. There is another, a wide-spread legend, that in the time of imminent peril a prophet would come out of the east, the forerunner of the Mahdi, the deliverer of Islam, and gather about him a body of devoted followers who would march into Fez, protected by his miraculous powers from all weapons; and there, in the great mosque, he would summon the master of the hour, the Mahdi himself, and arm him with a sword plucked from the center of a marble column with which to go forth to conquer the world.

A man appeared who was hailed as the forerunner of the Mahdi. He was of low birth, but had received an education, and having disgraced himself in some way, went abroad and in Algeria and Tunis gained knowledge of the world and skill in legerdemain. Returning to Morocco, he went among the Berber tribes, convincing them of his sanctity by his humility in riding a donkey while his servant was mounted on a horse, and by his power to work miracles, as his conjuring tricks were deemed to be. He collected alms to a large amount, and finally, in Ghiata he was either spontaneously acclaimed or designedly assumed the rôle of the forerunner of the Mahdi. The fame of Bu Hamara, the donkey father, as he was called in recognition of his humility, spread, and devoted followers gathered about him from Fez and all parts of the land who made him take the part of prophet of the Mahdi and destined deliverer of the country from the Christian peril. He need but thrust

GENERAL VIEW OF FEZ.

Sultan had him arrested and summarily executed. It was the love of the Sultan for European things, his friendliness to Europeans and adoption of reforms and innovations suggested by them, that prompted the murderer, that was one of the causes of the Berber insurrection, that gave rise to doubts and fears among all classes and angry dissent in the official world. There is a legend at Fez that Christian horses would yet

his hand into his donkey's pannier to withdraw it full of money; he need but wave his cloak, and tribes rose in arms against each other; he need but gaze into the face of intending assassins, when their bullets would fall harmless into his lap; he need but curse a village to have it devoured by flames; the army led by him was invincible because the lead in the enemy's rifles turned to water—such were the tales about his

supernatural powers. Coming out of the wild mountain region, he reached the town of Tessa on Oct. 25, where he was received as a prophet and deliverer. He preached the massacre of Christians and the overthrow of the fatherless Sultan, and said that when his army, miraculously protected from harm, marched into Fez, the Jews' quarter would be consumed by a fire from heaven, leaving none but true believers to greet the Messiah of Islam when he appeared; but he himself should rule over Morocco, his Sharifian descent being equal to that of Mulai Abdul Aziz, for he claimed to be the Sultan's elder brother, Mulai Mohammed, freed from prison by divine power to become the Moorish prince of true believers. Prince Mohammed, whom the fanatical Moslems had desired for their Sultan when Sid Ahmed ben Musa had placed Abdul Aziz on the throne without giving the people a free choice, his acclamation as successor of Mulai Hassan by the people in Fez having been a sham manifestation arranged by the Vizier, was immured in the palace at Mekinez, where he was still kept under guard because the tribes wanted him still. When the rebellious Berbers attacked Mekinez they intended to deliver Mohammed and make him Sultan. The pretender was in fact Omar Zarahuni, born of a common family in Ulad Yusef, but he convinced the people that he was the Sharifian prince because Mohammed was known to have a birthmark over one of his eyes and he had a similar mark. From Tessa he sent messages to the tribes announcing his holy mission and calling upon them to obey him as the rightful Sultan. When he raised his standard and prepared to march on Fez the Government was stirred to action. Mulai el Kebir, brother of the Sultan, led out a force of 2,000 infantry and 600 cavalry, reinforced later by more horsemen. The armies came face to face at Ulad Taher, and there both pitched camp, and each waited for the other to strike a blow. Bu Hamara's force was swelled daily by new recruits who continued to flock in; yet the imperial army, in spite of imperative orders from Fez, still remained inactive until on the dawn of Nov. 3 the pretender's horsemen dashed into the unguarded camp, massacred the sleeping soldiers, seized the stacked arms, and would have slain the whole helpless, panic-stricken army had not the irregular horse of the Beni Hassan tribe opened fire, upon which Bu Hamara's warriors, undeceived as to their immunity from death and

wounds, in turn smitten with terror, fled quaking, and were pursued by the surviving remnant of the Sultan's troops, who captured many prisoners and returned to Fez with the heads of a score of the pretender's slain adherents, to be nailed at the city gates as a warning to traitors. Bu Hamara himself slipped away during the fight with his lieutenants and his treasure and escaped to the mountains, where he easily persuaded his routed followers who found him there and others who arrived in increasing numbers that the rash attack was the act of others who depended on human initiative, and that the slight mishap was needed to try the faith of his army and teach men to trust only in his inspired leadership.

The Benadir Kabyles, contaminated with the antforeign and restless spirit with which the whole country was rife, demanded of the Governor of Tetuan the release of the murderer of an Englishman and of other prisoners confined in the city, and when he refused they threatened to raid Tetuan. The Government sent a steamer with ammunition and stores, and Spanish, British, French, German, and Russian war-vessels assembled. The Kabyles plundered caravans and took captives, but released them, surrendered the booty, and prayed for pardon before the imperial forces moved. The pretender, with a larger and more enthusiastic army, advanced again from Ghiata toward Fez. The Sultan's army, affected by the wave of religious zeal, depressed by doubt and fear, fought half-heartedly when the forces met east of Fez on Dec. 28, was defeated with a loss of 300, and could not be rallied, but fell back upon Fez and allowed the rebels to invest the capital and cut the aqueduct that supplied the city with water. The Sultan attempted to break out with his most reliable troops, but was foiled by the rebels. The fortress of Raselma, close to Fez, was evacuated by the Sultan's troops. The pretender invited the Berber tribes late in rebellion to embrace his cause, while the Sultan's hopes lay in the Kabyle tribes in the south. When Fez was seriously threatened and the soldiers and populace showed a hostile spirit against the Sultan, so that he dared not appear unless surrounded by his faithful body-guard from the south, he sent for his brother Mohammed, exhibited him to the people to prove that the rumor that he and Bu Hamara were the same was false, and went through the form of a reconciliation, though he kept him still under guard.

N

NATIONAL ACADEMY OF SCIENCES. The officers in 1902 were: President, Alexander Agassiz; Vice-President, Asaph Hall; Foreign Secretary, Ira Remsen; Home Secretary, Arnold Hague; Treasurer, Charles D. Walcott till April 20, when he was succeeded by Samuel F. Emmons. Two meetings were held in 1902. The first or stated meeting was held in Washington, D. C., April 15 to 18. On that occasion the following papers were presented: On the Coral Reefs of the Maldives and On the Theory of the Formation of Coral Reefs, by Alexander Agassiz; The Physiological Station on Monte Rosa, by Henry P. Bowditch; Psychophysical Fatigue, by J. McKeen Cattell; The Present Aspect of our Knowledge as to the Constant of Aberration, by Seth C. Chandler; On Catalysis, by James M. Crafts; The Disintegration of Comets, by Asaph Hall; Determination of the Weight of the Vapor

of Mercury at Temperatures below 100°, by Edward W. Morley; On Some Optical Properties of Asphalt, by Edward L. Nichols; Evolution of the Titanotheres: III. Models and Restorations, Homoplasy and Latent Homology: A Correction, and Evidence that North America and Eurasia constituted a Single Zoological Realm during the Mesozoic and Cenozoic, and that Correlations can be established as a Basis for Uniformity of Geological Nomenclature, by Henry F. Osborn; Monograph of the Bombycine Moths of America, including their Transformation, with a Revision of the Known Genera: Part III. Sphingicampidæ, by Alpheus S. Packard; The Classification of the Sciences, The Postulates of Geometry, and The Color System, by Charles S. Peirce; The Distribution of the Stars and The Variability in Light of Eros, by E. C. Pickering; The Atomic Weight of Cesium and The Significance of Chan-

ging Atomic Volume, by Theodore W. Richards; The Compulsory Introduction of the French Metrical System into the United States, by William Sellers; and A New Computation of the Coefficients of Precession and Nutation, by Ira Ibsen Sterner, a non-member. Also the following biographical memoirs: John Gross Barnard, by Henry L. Abbot; Francis Amasa Walker, by John S. Billings; John Strong Newberry, by Charles A. White; and William Augustus Rogers, by Arthur Searle, a non-member.

The public business included the election of Samuel F. Emmons to the office of treasurer, made vacant by the resignation of Charles D. Walcott, and the election of the following members to the council: John S. Billings, Henry P. Bowditch, George J. Brush, Simon Newcomb, Charles D. Walcott, and William H. Welch. The following new members were elected: William Wallace Campbell, director of Lick Observatory, Mount Hamilton, Cal.; George Ellery Hale, Professor of Astrophysics and director of Yerkes Observatory of the University of Chicago, Williams Bay, Wis.; Clinton Hart Merriam, director of the United States Biological Survey, Department of Agriculture, Washington, D. C.; William Trelease, Professor of Botany in Washington University and director of the Missouri (Shaw) Botanical Garden, St. Louis, Mo.; and Charles Richard Van Hise, Professor of Geology in the University of Wisconsin and geologist on the United States Geological Survey, Madison, Wis.

The scientific session was held in Johns Hopkins University, Baltimore, Md., Nov. 11 and 12, 1902, when the following papers were read: On Elevated Oceanic Islands in the Pacific, by Alexander Agassiz; A New System of Positions for Standard Stars, with Notes relative to its bearing upon Sidereal Astronomy, by Lewis Boss; The Embryology of *Salpa Cordiformis*, by William K. Brooks; The Spectra of Stars of Secchi's Fourth Type, by George E. Hale; Complete Skeleton and Restoration of the Cretaceous Fish *Porteus Molossus* Cope, A New Small Dinosaur from the Jurassic or Como Beds of Wyoming, apparently a Bird-Catcher, and New or Little-Known Elephants and Mastodons of North America, by Henry F. Osborn; A Possible Explanation of the Difficult Solubility of Certain Compounds containing Fluorin and Hydroxyl, by Samuel L. Penfield; and a Biographical Memoir of Henry A. Rowland, by Thomas C. Mendenhall. Also the following papers by non-members: The Occurrence of Reef Corals near Beaufort, N. C., by Caswell Grave; The Trematode Parasites of the Oyster, by D. H. Tennent; The Preparation of Cells for the Measurement of Osmotic Pressure, by Harmon N. Morse; A Substance with Remarkable Optical Properties and Screens transparent only to Ultra-Violet Light, by Robert W. Wood; On Displacement Currents, by J. B. Whitehead; and On the Spectrum of Hydrogen, by L. A. Parsons.

No business of public importance was transacted at this session. In the year the academy lost by death Alpheus Hyatt, Henry Morton, Ogden Nicholas Rood, and John Wesley Powell, of whom brief sketches are given under OBITUARIES, AMERICAN.

NEBRASKA. (See under UNITED STATES.)

NETHERLANDS, a monarchy in western Europe. The legislative power is vested in the States General, consisting of the First Chamber, which has 50 members, elected by the provincial councils for nine years, and the Second Chamber, elected for four years by all citizens who pay direct taxes or are legally qualified for a profes-

sion, or who have money in the savings-bank or a salary of 275 guilders a year, or who are owners of boats or occupants of dwellings. The reigning sovereign is Queen Wilhelmina, born Aug. 31, 1880, daughter of Willem III and Queen Emma, born a Princess of Waldeck, who from the death of the late king, on Nov. 23, 1890, till Sept. 6, 1898, acted as Regent. Queen Wilhelmina married, on Feb. 7, 1901, Prince Henry of Mecklenburg-Schwerin.

The Council of Ministers constituted on July 31, 1901, was composed as follows: President of the Council and Minister of the Interior, Dr. A. Kuyper; Minister of Foreign Affairs, Dr. R. Melvil, Baron van Lynden; Minister of Finance, Dr. J. J. T. Harte van Tecklenburg; Minister of Marine, Vice-Admiral G. Kruys; Minister of War, Lieut.-Gen. J. W. Bergansius; Minister of Public Works and Commerce, Dr. J. C. de Marez Oyens; Minister of Justice, Dr. J. J. Loeff; Minister of the Colonies, Dr. T. A. J. van Asch van Wyk.

Area and Population.—The area of the Netherlands, or Holland, is 12,648 square miles. The population on Dec. 31, 1900, was estimated at 5,179,100, comprising 2,560,293 males and 2,618,807 females. Of the total 36.6 per cent. lived in towns of over 20,000 inhabitants. The census of Dec. 31, 1899, made the total population 5,104,137. The number of foreigners was 52,625, of whom 31,865 were Germans, 14,903 Belgians, 1,307 English, and 4,550 from other countries. The number of marriages in 1900 was 39,419; of births, 162,611; of deaths, 92,043; excess of births, 70,568. The number of emigrants was 1,899, of whom 1,893 went to the United States and 6 to South Africa. Of the emigrants 907 were men, 477 women, and 515 children. The number of emigrants, native and foreign, who embarked in Dutch ports was 34,794. Amsterdam had 520,602 inhabitants at the beginning of 1901; Rotterdam, 332,185; The Hague, 212,211; Utrecht, 104,104.

Finances.—The revenue in 1900 amounted to 155,062,000 guilders, including 600,000 guilders from extraordinary sources. Of the ordinary revenue 34,849,358 guilders came from direct taxes, 49,248,119 guilders from excise, 26,342,694 guilders from indirect taxes, and 9,701,878 guilders from customs. The total expenditure was 154,528,512 guilders, of which 40,847,400 guilders were for the army and navy, 34,882,758 guilders for debt service, 15,282,031 guilders for public works, and 63,516,323 guilders for general expenses. For 1901 the estimate of revenue was 149,472,180 guilders, and of expenditure 154,755,492 guilders. The revenue for the year ending in October, 1902, was estimated in the budget at 154,002,245 guilders, of which the land tax yields 13,016,000 guilders, the personal tax 9,022,000 guilders, the tax on capital 7,464,000 guilders, the tax on incomes from trades, professions, etc., 6,300,000 guilders, excise 50,020,000 guilders, indirect taxes 22,161,000 guilders, import duties 9,618,000 guilders, the tax on gold and silver 320,900 guilders, domains 1,670,000 guilders, the post-office 11,122,000 guilders, telegraphs 2,487,000 guilders, the state lottery 651,000 guilders, shooting and fishing licenses 135,000 guilders, pilot dues 2,350,000 guilders, mining dues 26,220 guilders, state railroads 4,188,150 guilders, share of Netherlands India in the interest and sinking-fund of the debt 3,865,000 guilders, and miscellaneous receipts 19,585,975 guilders. The budget estimate of the total expenditures for 1902 was 167,233,180 guilders, of which the civil list takes 800,000 guilders, the States General and the Royal Cabinet 681,500 guilders, the Ministry of Foreign Affairs 853,218 guilders, the Ministry of Justice 6,349,916 guilder-

ders, the Ministry of the Interior 15,966,758 guilders, the Ministry of Marine 16,657,694 guilders, the Ministry of Finance 25,108,117 guilders, the Ministry of War 22,716,429 guilders, the Ministry of Public Works 29,380,074 guilders, the Ministry of the Colonies 1,317,218 guilders, the public debt 34,731,380 guilders, contingent expenses 50,000 guilders. The revenue and expenditure of the provinces in 1901 amounted to 6,177,700 guilders; expenses of communes, 103,287,000 guilders, including 17,725,000 guilders of debt charges; revenues of communes, 111,739,000 guilders.

The budget for 1903 places the revenue at 156,540,000 florins and the expenditure at 164,574,000 florins, leaving a deficit to be recouped in great part from the extraordinary budget. In order to increase the ordinary revenue the excise duty on spirits was raised from 63 to 70 guilders per hectoliter.

The national debt of the Netherlands in 1902 amounted to 1,155,390,450 guilders, including 15,000,000 guilders of paper money, but not floating debt and annuities. Of the funded debt 624,995,400 guilders bear 2½ per cent. interest and 515,395,000 guilders, consisting of loans contracted in 1895, 1898, and 1899, pay 3 per cent. The interest on the funded debt was 31,088,736 guilders in the budget of 1902; on floating debt, 300,000 guilders; annuities 95,644 guilders; sinking-fund, 3,247,000 guilders.

The Army and Navy.—The peace strength of the army on June 1, 1900, was 1,911 officers and 25,762 men, forming 9 infantry and 3 cavalry regiments, 3 regiments of field-artillery, 4 regiments of fortress-artillery, 1 corps of light horse-artillery, 1 battalion of sappers and miners, 1 corps of pontonniers, and 1 corps of torpedoists. For war the regular army can muster about 68,000 strong, and the first ban of the militia, consisting of men without families, numbers over 42,000. Under a law passed in 1901 men who have served eight years in the regular army will be enrolled for seven years in the *landwehr*, which will take the place of the militia. The yearly contingent of recruits drawn for the army is about 17,500, of whom 12,300 are trained eight and a half or twelve months, mounted troops eighteen and a half months; and 5,200 are trained four months and have to practise eight or twelve weeks in subsequent years. Paid volunteers still form the nucleus of the army.

The navy contains 5 armored cruisers, 7 deck-protected cruisers, and a small turret ship. The *Koningin Regentes* and *De Ruyter*, launched in 1899 and 1901, of 5,000 tons, have 10 inches of armor over their vital parts, an armament of 2 9.4-inch guns, 4 6-inch quick-firers, and 8 3-inch and many small quick-firers. Two other cruisers of this class are building and 6 monitors, 3 of which, of 1,500 tons, will carry 2 8-inch guns and 4 3-inch quick-firers and the 3 others, of 1,400 tons, 1 8-inch gun, 1 4.7-inch quick-firer, and the same number of small quick-firers. Twelve monitors of early date are still efficient. There are 13 first-class, 15 second-class, and 28 third-class torpedo-boats.

Commerce and Production.—There were 865,676 hectares under farm crops in 1899; in gardens and orchards, 62,061 hectares; pasture, 1,185,366 hectares; forest, 250,383 hectares; uncultivated, 891,558 hectares. There were 80,777 properties of less than 5 hectares, 63,584 hectares between 5 and 20 hectares, 25,444 between 20 and 50 hectares, and 3,587 above 50 hectares. Of the total, 56.4 per cent. were cultivated by the owners. The number of cattle in 1899 was 1,646,500; horses, 284,900; sheep, 755,400; pigs 1,348,500.

There were 213,864 hectares under rye, 155,535 under potatoes, 128,223 under oats, 71,836 under wheat, 46,465 under beets, 33,821 under beans, 29,028 under buckwheat, 26,501 under winter barley, 25,621 under peas, 9,030 under summer barley, 8,000 under flax, 4,764 under rape, 744 under tobacco, and 68 under madder in 1899. The imports of wheat in 1900 were valued at 129,641,000 guilders, and exports at 98,215,000 guilders; imports of wheat and rye flour at 58,679,000 guilders, and exports at 13,051,000 guilders; imports of rye at 87,066,000 guilders, and exports at 39,299,000 guilders; imports of barley at 23,062,000 guilders, and exports at 15,960,000 guilders; imports of oats at 29,738,000 guilders, and exports at 25,432,000 guilders; imports of potato starch at 5,102,000 guilders, and exports at 17,420,000 guilders; imports of buckwheat at 1,391,000 guilders, and exports at 600,000 guilders; imports of beets at 83,000 guilders, and exports at 2,413,000 guilders; imports of flax at 1,443,000 guilders, and exports at 16,439,000 guilders; imports of bulbs, shrubs, and trees at 601,000 guilders, and exports at 8,210,000 guilders; imports of vegetables at 2,171,000 guilders, and exports at 47,416,000 guilders.

The yield of the herring fisheries in the North Sea in 1900 was valued at 7,339,375 guilders. The number of Dutch fishing craft was 5,719, with 19,498 men in their crews. The coal produced in 1900 was 124,538 metric tons, valued at 682,060 guilders.

The total value of imports for consumption in 1900 was estimated at 1,968,000,000 guilders; exports of domestic products at 1,695,000,000 guilders; transit trade, 5,808,000,000 guilders. Imports of iron and steel and manufactures thereof were valued at 188,694,000 guilders, and exports at 142,526,000 guilders; imports of textile materials and manufactures at 122,814,000 guilders, and exports at 88,059,000 guilders; imports of cereals and flour at 328,186,000 guilders, and exports at 191,957,000 guilders; imports of rice at 48,106,000 guilders, and exports at 25,901,000 guilders; imports of coal at 59,632,000 guilders, and exports at 9,624,000 guilders; imports of mineral oil at 12,103,000 guilders, and exports at 52,000 guilders; imports of coffee at 50,375,000 guilders, and exports at 33,214,000 guilders; imports of butter at 741,000 guilders, and exports at 22,572,000 guilders; imports of margarine at 22,268,000 guilders, and exports at 44,705,000 guilders; imports of sugar at 18,164,000 guilders, and exports at 53,786,000 guilders; imports of cheese at 85,000 guilders, and exports at 16,068,000 guilders; imports of vegetables at 2,171,000 guilders, and exports at 47,416,000 guilders; imports of lumber and wood at 59,272,000 guilders, and exports at 39,575,000 guilders; imports of hides and skins at 27,129,000 guilders, and exports at 29,060,000 guilders; imports of indigo at 4,319,000 guilders, and exports at 3,052,000 guilders; imports of copper at 85,486,000 guilders, and exports at 88,292,000 guilders; imports of paper at 6,253,000 guilders, and exports at 43,632,000 guilders; imports of tallow, grease, and suet at 23,790,000 guilders, and exports at 12,775,000 guilders; imports of saltpeter at 31,457,000 guilders, and exports at 25,336,000 guilders; imports of tin at 23,785,000 guilders, and exports at 19,191,000 guilders; imports of zinc at 11,071,000 guilders, and exports at 10,879,000 guilders; imports of paints and colors at 18,033,000 guilders, and exports at 15,280,000 guilders; imports of oil-seeds at 30,661,000 guilders, and exports at 15,951,000 guilders; imports of flax at 1,443,000 guilders, and exports at 16,439,000 guilders; imports of

tobacco at 10,657,000 guilders, and exports at 7,453,000 guilders; imports of gold and silver at 17,234,000 guilders, and exports at 3,490,000 guilders. The value of all articles of food and drink imported was 509,960,000 guilders, and the value exported 490,872,000 guilders; the value of raw materials imported was 462,821,000 guilders, and the value exported 348,266,000 guilders; the value of manufactured products imported was 243,897,000 guilders, and the value exported was 240,024,000 guilders; the value of miscellaneous products imported was 356,019,000 guilders, and the value exported was 301,308,000 guilders. The values in guilders of the imports from and exports to the principal countries in 1900 are given in the following table:

COUNTRIES.	Imports.	Exports.
Prussia.....	356,100,000	876,800,000
Great Britain.....	288,300,000	392,600,000
Belgium.....	207,900,000	175,700,000
United States.....	258,500,000	64,600,000
Dutch East Indies.....	272,500,000	68,800,000
Russia.....	144,500,000	10,800,000
Hamburg.....	28,700,000	33,800,000
France.....	22,600,000	20,900,000

Navigation.—The number of vessels entered at Dutch ports during 1900 was 12,307, of 9,475,164 tons, of which 3,335 were Dutch, of 2,381,358 tons, and 8,972, of 7,093,806 tons, were foreign; the total number cleared was 12,367, of 9,449,676 tons, of which 3,449, of 2,406,846 tons, were Dutch and 8,918, of 7,042,830 tons, were foreign. Of the total number entered 11,589, of 9,218,868 tons, were with cargoes and 718, of 256,296 tons, were in ballast; of those cleared 7,472, of 4,655,454 tons, were with cargoes and 4,895, of 4,794,222 tons, were in ballast. Of the ships entered with cargoes, 63.1 per cent. and of those cleared 47.1 per cent. of the tonnage was entered and cleared at Rotterdam; at Amsterdam, 15.8 per cent. of the tonnage entered and 19.6 per cent. of that cleared; at Flushing, 7.4 per cent. of the tonnage entered and 14.2 per cent. of that cleared.

The Dutch commercial marine in the beginning of 1901 consisted of 425 sailing vessels, of 78,588 tons, and 213 steamers, of 269,586 tons.

Railroads, Posts, and Telegraphs.—The length of the railroads in operation in 1900 was 1,730 miles. The Government railroads, having a length of 969 miles, constructed at a cost of 270,509,000 guilders, carried 12,257,000 passengers and 7,274,000 metric tons of freight in 1900, earning 23,789,000 guilders, with 20,809,000 guilders of expenses. Private railroads carried 17,761,000 passengers and 4,386,000 tons of freight, earning 18,863,000 guilders and expending 14,829,000 guilders.

The post-office during 1900 forwarded 74,800,000 domestic and 28,112,000 foreign letters, 46,613,860 domestic and 9,193,398 foreign postal cards, 140,208,000 domestic and 15,855,000 foreign newspapers and other printed enclosures, 4,180,240 domestic and 1,003,645 foreign parcels, and 336,262 domestic and 112,473 foreign money-orders. The receipts from the post-office were 10,149,535 guilders; expenses, 7,742,436 guilders.

The Government telegraph-lines on Jan. 1, 1901, had a total length of 3,831 miles, with 14,210 miles of wire. The number of messages sent in 1900 was 5,393,872, excluding official messages; receipts were 2,151,346 guilders, and expenses 2,726,961 guilders.

Politics and Legislation.—The elections for the renewal of one-third of the members of the First Chamber took place early in July. The Liberals lost 1 seat, leaving them still 27 in the upper house, while the Anti-Revolutionists and

Catholics with this seat won had 23 members. The lower house was strongly Anti-Liberal, but the Cabinet of Dr. Kuyper, composed of Orthodox Protestants and Catholics, had no urgent mandate other than to keep educational and other controversial matters as they were and initiate no legislation that was not manifestly useful and imperative. In the session which closed just before the elections the most critical measures discussed were a military penal code drawn up by Prof. van der Hoeven, and a bill on military discipline. The Socialists thought that soldiers under sentence, like civilians, were entitled to a stay of execution pending an appeal. Gen. Bergansius rejected this proposal as prejudicial, but he raised no objection to a compromise offered by a member of the Ministerial party providing for the temporary suspension of a military sentence until after the house had adopted this amendment, when he declared that the Government could not accept the vote. The matter was reconsidered in order to extricate the Cabinet from an awkward dilemma, and the clause was recast by the Minister of War himself, who had to make a concession, since Ministerialists as well as the Opposition were committed to an opinion contrary to his own. The Protectionists wished to increase the import duties on foreign sugar and, until the Brussels convention goes into effect, the sugar bounty, amounting to 2,500,000 guilders a year, in order to strengthen the crippled domestic beet-sugar industry against the still stronger competition it will have to meet when bounties are abolished. Minister Harte van Tecklenburg condemned temporary measures and was non-committal as to his future policy. The Queen, who instead of giving birth to an heir, nearly lost her own life in April, opened the First and Second Chambers in person on Sept. 16. The Minister of the Colonies, Dr. van Asch van Wyk having died, Lieut.-Gen. Bergansius took the portfolio temporarily in addition to his own on Sept. 10. Baron Melvil van Lynden, Minister of Foreign Affairs, exploded the rumors that Holland was seeking powerful allies to protect her East Indian possessions from England, a subject that had been discussed in the press, in which the opinion prevailed that to join the triple alliance would be tantamount to surrendering the colonies to Germany and compromising the national independence, and to join the dual alliance, though less hazardous, would lead to complications and dangers perhaps as fatal in the end; that it would be better to give up the colonies than to sacrifice Holland's position as an independent nation; and that the colonies were not in any way menaced by the Anglo-Japanese alliance, for England could not provoke a quarrel with Holland without risk of an armed conflict with other European powers.

International Arbitration and Laws.—Ideas of international law have been indigenous in Holland since the time of Grotius, and for this reason and on account of her neutral position The Hague was chosen by the Czar to be the meeting-place of the conference of 1899 and the seat of the International Tribunal of Arbitration evolved from his proposals. According to the convention concluded on July 29, 1899, the president of the permanent administrative council of The Hague Tribunal is the Minister of Foreign Affairs and the members are the diplomatic representatives of the signatory powers. The members of the Court of Arbitration appointed by the respective powers were as follows: Germany, Dr. Bingner, Herr von Frantzius, Prof. von Martitz, and Prof. von Bar; Austria-Hungary, Count Friedrich Schoenborn, Count Albert Apponyi, and Dr. Heinrich Lam-

masch; Belgium, A. Beernaert, Baron de Lambert, Chevalier Descamps, and M. Rolin-Jacquemyns; Denmark, Prof. H. Matzen; Spain, the Duke of Tetuan, R. F. Villaverde, B. Oliver, and Prof. M. Torres Campos; United States of America, Benjamin Harrison, Chief-Justice Melville W. Fuller, John W. Griggs, and Judge George Gray; United States of Mexico, Dr. M. de Aspiroz, Dr. José M. Gamboa, Dr. G. Raigosa, and Dr. A. Chavero; France, Léon Bourgeois, M. de Laboulaye, Baron D'Estournelles de Constant, and Prof. Louis Renault; Great Britain, Lord Pauncefote of Preston, Edward B. Malet, Sir Edward Frye, and Prof. John Westlake; Italy, Count Nigra, Judge J. B. Pagano Guarnaschelli, Count Tornielli-Brusati di Vergano, and J. Zanardelli; Japan, I. Motono and H. Willard Denison; Netherlands, Dr. T. M. C. Asser, Judge F. B. Coninck-Liefsting, Dr. A. F. Savornin Lohman, and Dr. G. L. M. H. Ruys van Beerenbrouck; Portugal, Count de Macedo, Judge A. E. Correia de Sa Brandão, and Judge L. F. de Bivar-Gomes da Costa; Roumania, T. Rosetti, J. Kalindero, E. Statesco, and J. N. Lahovari; Russia, N. V. Muravieff, C. P. Pobedonosteff, E. V. Frisch, and Prof. Martens; Serbia, Prof. George Pavlovich, Prof. G. Gerchich, Dr. M. Milanovich, and Dr. M. Vesnich; Siam, G. Rolin-Jacquemyns, and Dr. F. W. Holls; Sweden and Norway, Dr. S. R. D. K. von Olivecrona, and G. Grim; Switzerland, Dr. C. Lardy, Prof. C. Hilty, and Dr. E. Rott; Bulgaria, Dr. S. Daneff and Dr. D. Stancioff. The general secretary is Dr. L. H. Ruysenaers; the chief secretary of the international bureau, Dr. J. J. Rochussen. The International Court for the first time since it was constituted was consulted in the summer of 1902 by some of the signatory states on several questions of international law and the interpretation of treaties. Denmark and the United States submitted a question connected with the proposed transfer of St. Thomas. Germany and the Netherlands wanted to have a question of international law settled that arose from their cable convention. The Russo-American dispute arising from the capture of American sealers in Bering Sea was referred to the decision of Prof. Asser before the Hague Tribunal was organized. H. H. D. Peirce, third assistant secretary of the Department of State at Washington, presented the American, and M. Komaroff the Russian case. The arbitrator came to a decision in August, awarding damages to the American sailors and owners for proved losses because the boats were seized without due warning, but not for the prospective catch. The first case to come before the International Court of Arbitration was presented by the United States and Mexico. The dispute, dating from the annexation of California, was over the pious fund for missions held by the Mexican Government, which the Catholic missions in California claimed. The United States nominated Sir Edward Frye and Prof. Martens as arbitrators, Mexico selected Judge Guarnaschelli and Judge Lohman, and the four chose Prof. Matzen to preside. Senator Stewart and Garret McEnery pleaded for the United States, the latter representing Archbishop Riordan, of California, the private plaintiff. The case was opened on Sept. 9 and decided on Oct. 14 (see UNITED STATES).

A series of conferences were held at The Hague at the invitation of the Dutch Government with a view of removing the needless differences in the legislation and practise of different nations in the domain of private international law, especially in the laws relating to marriage and divorce,

guardianship, and wills and succession. In 1874 the Government of the Netherlands first broached the subject and offered to act as an intermediary in bringing about an international juristic union to harmonize as far as possible unity of private international law. The first of the conferences, which met on Sept. 12, 1893, ended in resolutions as to many points of divergence and discord. The adjustment of the multitude of differences was a work of study and negotiation extending over years. As the result conventions were concluded in 1902 in which the laws of marriage, divorce, and judicial separation and of the guardianship of minors were to a great extent harmonized in respect to the status of parties concerned and other international aspects. All the important states of Europe were represented at the conference with the exceptions of Great Britain, Greece, Serbia, and Turkey. The United States and Great Britain held aloof because their systems of law differ so widely from those of Continental nations that it was considered hopeless to seek to adjust them to an international code. The conventions were signed by Germany, Austria-Hungary, Belgium, Spain, France, Italy, Luxemburg, Netherlands, Roumania, Sweden, and Switzerland. Denmark, Norway, and Russia did not immediately adhere. The conferences revealed many matters in which unity can not be attained by reason of causes that are too deep to be effaced. It was found that in some laws diversity is increasing. A conference to bring about a unity of bankruptcy laws had no immediate result. Half of the 16 states represented have bankruptcy laws for persons only who are engaged in commerce, while in the others the laws apply to all who are unable to meet their debts. Guardians in most Continental states assume responsibilities that render the relation vastly more important than in England or America. One of the subjects discussed at the conferences was in regard to the conditions on which foreigners can sue. In 1896 Belgium, Spain, France, Italy, Luxemburg, Portugal, and Switzerland, as the result of conferences at The Hague, signed treaties adopting common rules of procedure, some involving important changes and others merely recording the existing practise. In some states the bonds required from foreigners to give security for costs are made less onerous and facilities are given for suing *in forma pauperis*. In determining questions of status, while Great Britain, as well as the United States, adheres to the test of domicile, the Continental countries incline to make it depend on nationality, and the conferences have tended to hasten an international agreement to that effect.

The Dutch East Indies.—The Governor-General has authority to make laws with the advice of his Council for the Dutch East Indies, subject to general laws passed by the States General. W. Rooseboom has been Governor-General since June 1, 1899. The territory is divided into the lands under direct Government administration, vassal lands, and confederated lands. For administrative purposes it is divided into residencies, divisions, regencies, districts, and *dessas* or villages. Java and Madura, administered by 22 residents, are distinguished from the outposts, which are Sumatra, Borneo, the Riau-Lingga Archipelago, Banca, Billiton, Celebes, the Molucca Archipelago, the Sunda Islands, and western New Guinea. The total area of the Dutch East Indies is officially estimated at 736,400 square miles, and the population at 34,090,000. Java and Madura have an area of 50,554 square miles, with 26,125,053 inhabitants, of whom 35,489 males and 27,826 fe-

males in 1896 were Europeans or persons assimilated to them, about 460,000 were Chinese, 24,000 Arabs, 27,000 other Orientals, and the rest native Malays. Batavia, the capital, had 115,567 inhabitants; Soerabaya, 142,980. The number of native Christians in Java and Madura was 19,193; in the outposts, 290,065. The revenue of Netherlands India in 1901 was 149,935,934 guilders, of which 39.3 per cent. was derived from taxes on houses and estates and trade licenses, 21 per cent. from monopolies of salt and opium, 24.9 per cent. from sales of coffee and other Government products, and 14.8 per cent. from other sources. The expenditure of the Government in 1901 was 149,885,383 guilders. The budget for 1902 showed a revenue of 27,066,344 guilders in the mother country and 124,905,070 guilders in the colonies and an expenditure in the colonies of 125,238,100 guilders and in the mother country of 32,911,312 guilders, making a total revenue of 151,971,414 guilders and a total expenditure of 158,149,412 guilders, leaving a deficit of 6,177,998 guilders. There have been deficits and surpluses according to the activity of operations against the Achinese of Sumatra. The Government products are coffee and cinchona, raised by the natives on the culture system of compulsory labor in lieu of rent or taxes, and tin and coal from the Government mines. The receipts in the Netherlands of the budget of 1902 are 3,340,797 guilders from sales of Government coffee, 277,200 guilders from sales of cinchona, 19,666,697 guilders from sales of tin, 2,150,000 guilders as the share of the Government in the profits of the Billiton Mining Company, 1,015,000 guilders from railroads, and 616,650 guilders from various sources. The receipts in India were 19,199,000 guilders from sales of opium, 18,486,000 guilders from import, export, and excise duties, 22,449,100 guilders of land revenues, 5,681,700 guilders from sales of coffee, 10,052,000 guilders from sales of salt, 13,809,000 guilders from railroads, 3,238,000 guilders from the tax on trades, 3,269,000 guilders from coal, and 28,721,270 guilders from other sources. About a third of the expenditure is for general administration in Java and in the Netherlands and another third for the army and navy. The strength of the army on Jan. 1, 1900, was 1,345 officers and 39,388 men. Of the non-commissioned officers and privates 14,960 were Europeans, 4,251 Amboinese, 45 Africans, and 20,132 natives of the Dutch East Indies. The backbone of the army is formed by officers and soldiers of the army of the Netherlands who, with the consent of their superior officers, are permitted to enlist in the Dutch East Indian army. Other Europeans are attracted to this dangerous service by high pay. Each infantry battalion is composed of 2 European and 2 native or 1 European and 3 native companies; the cavalry is mixed; the gunners in the artillery are Europeans; and in all the officers and half the non-commissioned officers of the army are Europeans or half-castes. The naval forces are only partly colonial and the expenses are shared by the mother country. The personnel consisted in 1899 of 1,268 Europeans and 727 natives in the Indian marine, comprising 18 vessels, and 1,067 Europeans and 206 natives in the auxiliary squadron of 4 vessels.

The soil of Java, excepting private estates in the west belonging chiefly to Europeans and Chinese and a few elsewhere, is Government property. The Government and private landowners also can claim one day's work in the week from the people living on their land. On the sugar plantations and on many other lands the Government in 1882 commuted this into a tax of 1 guilder

per capita per annum. Europeans possess 2,241,170 acres, Chinese 470,809 acres, and other Orientals 32,576 acres. There were 6,935,300 acres tilled by natives in Java and Madura in 1899. The extent of rice cultivation in 1899 was 5,198,622 acres, while sugar-cane occupied 265,382 acres, tobacco 265,809 acres, indigo 60,998 acres, and corn, arachis, cotton, and various other crops 4,331,327 acres, making a total of 10,122,550 acres. In 1899 there were taken on seventy-five-year leases 967,155 acres by European companies and individuals, 33,292 acres by Chinese, and 2,318 acres by natives, making a total of 1,002,765 acres for that year. The yield of sugar in 1899 was 1,608,718,400 pounds. The production of coffee was 32,988,583 pounds on Government lands, 7,884,800 pounds by the free cultivation of natives, 69,575,600 pounds on leased lands, and 7,595,466 pounds on private lands; total, 118,044,399 pounds. The yield of cinchona was 399,496 kilograms on Government plantations, 4,089,654 kilograms on leased lands, and 573,413 kilograms on private lands. The yield of tea was 5,452,773 kilograms; of indigo, 783,132 kilograms; of tobacco, 24,346,626 kilograms in Java and 23,958,369 kilograms in Sumatra. The production of tin in the Government mines of Banca and the mines operated by companies in Billiton and Riau was 16,460 tons. The quantity of coal produced by the principal mines of Java, Sumatra, and Borneo was 182,712 tons. The production of mineral oil was 1,638,569 cases in 1899 and 1,261,201 cases in 1900.

The total value of imports in 1899 was 191,322,270 guilders, of which 4,530,029 guilders were Government merchandise, 164,013,315 private merchandise imports, and 22,778,926 guilders imports of specie on private account. The total value of exports was 250,923,258 guilders, of which 14,944,387 were Government merchandise, 235,383,570 guilders private exports of merchandise, and 595,301 guilders private exports of specie. About half the rice exports go to Borneo and China; of all the rest four-fifths go to the Netherlands. There were entered at the ports of the Dutch East Indies 3,661 steamers, of 1,638,666 tons, and 389 sailing vessels, of 84,606 tons, in 1899. The States General in 1902 voted a subsidy for a line of steamers to ply between Java, China, and Japan. The railroads had a total length on Jan. 1, 1900, of 1,333 miles; net receipts in 1899 were 17,278,000 guilders. There were 6,910 miles of telegraph-lines; the number of despatches in 1899 was 672,892. A cable convention concluded with Germany in July, 1901, provides for a submarine telegraph-line connecting Dutch and German possessions in the East Indies with the American Pacific cable at Guam, and the Siberian line by a cable to Shanghai from Celebes, rendering both powers independent of the British lines for telegraphic communications not only with their colonies, but with China and Japan. The subsidized company, to which Germany pays \$250,000 a year and the Netherlands \$70,000, to be reduced to the extent of any profits in excess of 10 per cent., will lay a cable from Menado, in northern Celebes, to Guam, and from there to Shanghai, while the Dutch Government will lay one from Menado to Borneo, which is already connected with Java. To the treaty is added a secret protocol, probably defining mutual obligations and common action in the use and protection of the cable in the event of war, since the principle of the neutrality of cables was not incorporated in the international convention for the protection of submarine cables signed at Paris in 1882, because England declared that she would not sign the convention unless it left the action of belligerents free, a right which

the United States in the war with Spain freely exercised at Manila. Any disputes as to the construction of the German-Dutch cable convention will be decided by the International Court of Arbitration at The Hague. A joint commission in 1902 delimited the frontiers between the Dutch and the Portuguese parts of the island of Timor, which has hitherto been held jointly by both states.

The fundamental principle of the Dutch colonial policy in the East Indies is to leave the natives under the direct administration of native officials, chosen wherever possible from the families that once ruled over them, but now salaried functionaries of the state under the direction of superior white officials. The Governor-General is enabled to keep up a princely state to impress the natives and wield despotic powers. Weighty affairs he lays before the Council of India, consisting of 5 members, but he is not bound to follow its conclusions. He has authority to banish or intern either Europeans or natives who are considered dangerous to the peace of the land. The residents, who have under them 3 or 4 under-residents and 7 to 9 controllers, are appointed by the Governor-General, as are the army officers under the rank of general. Each residency of Java, with the exception of Batavia and the semi-independent sultanates of Solo and Djokja, contains numerous regencies. The regents are the high native officials who have been educated in the Government schools for native chiefs, and it is they who govern the people through the district *vedanas*, under whose orders are the village headmen, though under the constant supervision and direction of the controllers. The natives have an inborn respect for rank and authority, and as they are accustomed to seeing their own lordly chiefs humbly submissive to the lowest officers in the white hierarchy, with whom no native below a regent comes in contact, their reverence for the whites is unbounded. The educated Javans who do not obtain official posts and who have not the means to maintain the manner of life for which they were prepared are a dangerous element. Another is the Moslem priests, who stirred up trouble in western Java in 1888, although the Javans are no fanatics. The profits of the various cultures and systems of tenure go to Europeans and Chinese, while the native can get only a plot of ground on which to grow rice. The local trade is in the hands of Chinamen, who buy the crops of the native farmers, often in advance with money loaned at usurious rates, although they are forbidden by law. The 20,000,000 guilders of land rent that the Javanese farmers must raise besides other taxes make them an easy prey for these usurers. The fatalistic and submissive Javans have remained peaceful for three-quarters of a century, and now have less cause than ever to rebel, meager as is the fruit of their toil, for the Government endeavors to improve their lot and protect them from every form of oppression. The Dayaks of Sumatra and Celebes are men of a different stripe, ungovernable and warlike, whom the Dutch have never subdued. The flourishing tobacco plantations of Sumatra are tilled by Chinese coolies, whose indefatigable industry and painstaking care renders them indispensable. In Java the Chinese are and for centuries have been business men, and in business the Chinese merchant, contractor, planter, or manufacturer excels both the Malay and the European, not only by his assiduity, intelligence, and skill, but by his unscrupulous, corrupt, and ruthless methods. Formerly the Chinese were nowhere allowed to acquire land. The prohibition was removed in

certain districts, and since then nine-tenths of the real estate in Batavia has passed into their possession. The native peasantry have repeatedly been provoked into anti-Chinese riots and have massacred thousands of Chinamen.

There was a lull in the conflict with the Achinese in 1902. The head rebel having been rendered helpless, the Dutch maintained their posts on the coast and in the interior without molestation and made considerable progress in suppressing piracy on the sea and teaching the guerrillas on land to respect the Dutch flag. The chief, who is recognized by the rebels as Sultan of Achin, after his defeats in 1901, when his bands were decimated and cowed and his arms and treasure used up or captured, was not able to equip a new force, and consequently his influence as a leader waned. The war, which has cost the East Indian and Dutch treasuries immense sums of money, and in which great numbers of lives of European and native soldiers have been sacrificed, began in 1873, when the Achinese, encouraged by foreigners who carried on a contraband trade from Singapore, declared their independence. The first expedition against them was repulsed with heavy losses, the commander being among the killed, and returned to Batavia. A strong expedition was sent forthwith, and since then the Dutch have held their footing on the coast, but have occasionally occupied positions in the interior and vigorously pressed their brave and persistent enemies, then reduced their area of occupation and tried a policy of conciliation, but till now they have not been able to establish their rule over this unconquerable race inhabiting a wild and unhealthy country.

Dutch Guiana.—The Governor of Dutch Guiana, or Surinam, in 1902 was W. Tonckens. He is assisted by a Council of 4 members and in legislation by the Colonial States, composed of 13 members, 2 of whom are appointed and the rest elected for six years in the proportion of 1 member to 200 electors. The area of the colony is estimated at 46,060 square miles. The population on Dec. 31, 1899, was estimated at 67,128, exclusive of bush negroes. Paramaribo, the capital, had 31,427 inhabitants. There are about 14,000 East Indians in the colony. The revenue in 1901 was 2,705,000 guilders; expenditure, 2,324,000 guilders. The Netherlands Government made a grant of 381,000 guilders. The quantity of sugar produced in 1899 was 9,566,752 kilograms; of cacao, 3,969,945 kilograms; of bananas, 357,013 bunches; of rum, 8,447 hectoliters; of molasses, 12,309 hectoliters. Up to Dec. 31, 1899, the number of gold claims was 382, and the export of gold for the year was 872,373 grams, valued at 1,195,151 guilders; the production was 893,197 grams. The total value of imports in 1899 was 6,122,112 guilders; of exports, 5,517,384 guilders. The number of vessels entered was 231, of 135,602 tons; cleared, 232, of 137,650 tons. (For the colony of Curaçao see WEST INDIES.)

NEVADA. (See under UNITED STATES.)

NEW BRUNSWICK, an eastern province of the Dominion of Canada; area, 28,200 square miles; population in 1901, 331,120. Capital, Fredericton.

Government and Politics.—There were no changes in the Government of the province in 1902. Hon. L. J. Tweedie was Premier and Provincial Secretary; Hon. William Pugsley, Attorney-General; Hon. A. T. Dunn, Surveyor-General; Hon. C. H. Labillois, Chief Commissioner of Public Works; Hon. L. P. Farris, Commissioner for Agriculture and the Hon. Messrs. G. F. Hill and H. A. McKeown were members without of-

fice. The Speaker of the House of Assembly was Hon. C. W. Robinson. The Legislature was opened on March 6 by the newly appointed Lieutenant-Governor and former Senator, the Hon. Jabez B. Snowball, with a speech from the throne, of which the following are the significant portions:

"The death, at the hands of an assassin, of the President of the neighboring republic, with which this province has such intimate business and social relations, evoked a deep feeling of sympathy, and the Government, desiring to voice the sentiments of the people, extended to the United States Government, through his Excellency the Governor-General, an expression of the profound sorrow which we felt in common with all civilized nations, at the lamentable and tragic event.

"I am happy to be able to congratulate you upon the prosperous condition of business and the success which is attending the efforts of our people in the various pursuits in which they are engaged. The continued and rapid development of the dairying industries of the province, as shown by the increase in the production and exports of cheese and butter by the large numbers of cheese factories and creameries which have been established under the liberal encouragement afforded by the Government, is most gratifying. Being satisfied that there is reason to hope for indefinite expansion in this direction, my Government will, with your approval, continue the same vigorous policy as hitherto.

"The building of improved roller flour-mills has given considerable impetus to the growth of wheat and has resulted in saving to our people large sums of money which would otherwise be sent out of the province for flour. I am sure that you will be gratified to know that the financial assistance which you authorized for the erection of these mills has already been productive of such good results, and that you will approve of this policy being continued, so that all parts of the country may receive the benefit of Government assistance in this direction.

"Consequent upon legislation passed at the last session to provide for the development of the coal areas of Queens and Sunbury, the railway to the coal-fields is now under construction, and it will not be long before the line from Chipman to Fredericton will be completed.

"The rapid development of the Canadian winter business through the port of St. John is most gratifying. The aid granted some years ago by the province toward the building of wharves and an elevator at that port, and the extremely liberal expenditure on the part of the city, have produced results which can not but prove of permanent benefit, not alone to the city of St. John, but to the whole province and to the Dominion as well, which is interested in having Canadian business carried on through Canadian ports.

"It affords me pleasure to inform you that since you last convened the Dominion Government has paid to the province the amount of the eastern extension award, with the exception of a small portion which has been withheld pending an arrangement being made between the two governments in respect to a claim regarding certain land taken as part of the right of way for the railway out of which the claim arose.

"By the recent judgment of the Judicial Committee of the Privy Council, it has been decided that the fisheries within the territorial limits of the provinces belong to the provinces, and in the opinion of my Government it follows that the amount of the Halifax award should have been paid to the province and not to the Dominion. My Government will press for payment to this

province of the portion of the award to which it is properly entitled.

"The unsatisfactory condition of the branch railways in the province, connecting with the Intercolonial, is such as to call for serious consideration. These railways have been constructed largely by means of Dominion and provincial subsidies, and are not giving that accommodation to the public which was anticipated when their construction was provided for. If some arrangement could be made by which these roads could be worked as a part of the Intercolonial system, it would be greatly to the public advantage, and there is reason to believe that they would become valuable feeders of the trunk line. You will be invited to consider whether the Dominion authorities might not properly be urged to make arrangements for their operation upon a fair and equitable basis.

"Bills to amend the public health act, providing, among other things, for the compulsory vaccination of children attending school; to amend the law regarding investments by trustees; a workman's compensation for injuries act; a bill to provide a forest reservation; a bill to provide for the importation of horses; and other measures of importance will be submitted to you."

The House adjourned on April 10 after considering 88 bills and passing several measures of purely local importance and effect. The address in reply was moved on March 7 by Ora P. King, who had recently been elected from Kings County to support the Government, and was seconded by Dr. Ruddick, who had won an election in St. John County also as a Government supporter. The Opposition leader, J. Douglas Hazen, spoke at length and was followed by the Premier.

Kings County Election.—The chief political event of the year was the contest in this county between Mr. King, the Government candidate, and Mr. Sproul, the Opposition candidate. Attorney-General Pugsley, under date of Feb. 10, issued a manifesto to the electors of the county, defending himself from the charges made in the previous year as to his non-prosecution of the men who were believed, or proved, to have manipulated and forged the electoral lists at Rothesay in that county. He pointed to his instant action in countermanding the writ for the election as soon as it was found something was wrong, and in presenting legislation to the House voiding the bogus lists and providing against any repetition of the offense by heavy penalties. He referred to the recent discovery of oil-fields in the province; to the general prosperity of the people; to the Government's policy of building small connecting railways so as to develop the vast deposits of coal existing in Queens and Sunbury Counties; to their investigation of the province's coal resources and arrangements with the Intercolonial and Canadian Pacific Railway companies for the purchase of a certain yearly quantity. Mr. Pugsley said he was urging upon the provincial and Dominion governments the great desirability of building a railway from St. John, up through the fertile St. John river valley, to Edmundston. He pointed out how the Government had won the Eastern Extension Railway award of \$275,000 from the Dominion, and were now expending it upon construction of bridges and repairs of public works; and how their policy of protest concerning the control of provincial fisheries by the Dominion authorities had been practically recognized.

Douglas Hazen, in behalf of the Opposition, replied to this document in a speech of great length delivered at Kingston on Feb. 15. He first handled

the Rothesay list charges, declared the Attorney-General responsible for the non-prosecution of the criminals who had created the fraudulent list, and accused him of having disfranchised the people of Kings County for nearly fifteen months. He spoke of the Opposition efforts to have the "one man, one vote" principle recognized, and declared that in 1895 Messrs. A. G. Blair, H. R. Emmerson, James Mitchell, and other members of the Government had opposed Dr. Stockton's resolution along that line. Mr. Hazen charged the Government with awarding various contracts for the superstructures of its steel bridges at prices two or three times higher than the current market rates, and without tender or competition. In financial matters he estimated the increased revenue of the Government at an average of \$158,024 per annum since they took office. He also charged them with an imposition in 1900 of \$94,221 in extra taxes. Yet despite these facts the public debt had increased from \$757,697 on Dec. 31, 1884, to \$2,815,086 on Oct. 31, 1900. He concluded by attacking the Attorney-General for receiving, indirectly, a large income from the province, though nominally only entitled to a small salary.

On March 2 Mr. King was elected by more than 200 majority, against a majority in 1900 of 829.

Opposition Policy.—In the Legislature, on April 2, Mr. Hazen, leader of the Opposition, moved a series of resolutions embodying the views of his small body of followers in the House and presenting the party policy for the general elections which were supposed to be imminent, but which did not come off in 1902.

Finances.—In presenting his budget speech on March 19, Mr. Tweedie defended the general policy of the Government in connection with lumber, mining, and railway interests, and declared that if its average revenues had increased so had expenditures upon public purposes, and he instanced the increase between 1882 and 1901 of the average yearly expenditures upon agriculture of \$9,532, upon education of \$36,362, upon roads and bridges and other public works of \$10,539, upon the care of the insane of \$14,928 more than upon those of the preceding fifteen years. He also pointed out that for ten years of the period since 1882 the Dominion subsidy had been increased by \$63,000 per annum. He then made the following statement as to the public debt:

"The largest item in the debt is, of course, the bonded debt, which at the end of the last fiscal year amounted to \$3,291,846. The responsibility for this debt may be divided as follow: Incurred by the Government of New Brunswick from confederation to the year 1883, \$2,224,566; incurred by the Government from 1883 to 1901, \$1,067,380; grain elevator and wharf, St. John, \$17,000; Lunatic Asylum, \$10,000; Dufferin Eaton wharf, \$8,000; railway subsidies, \$208,000; total, \$1,067,280."

The net debt was \$2,776,264, compared with \$2,851,086 in 1900. This was caused mainly by the receipt of the Eastern Extension award of \$281,821, which offset an addition to the debt, composed of \$30,999 deficit between ordinary receipts and expenditures, \$14,500 on subsidy accounts, \$14,419 over expenditure on Lunatic Asylum, and \$15,487 for the royal reception, \$88,895 over expenditure by Board of Works; and \$34,192 on steel bridges.

The estimated receipts for the year ending June 30, 1902, included \$495,320 from Dominion subsidies, \$195,000 from territorial revenue, \$10,000 from fees to Provincial Secretary's office, \$25,000 from taxes on incorporated companies, \$25,000

from succession duties, \$21,500 from liquor licenses, \$40,000 from proceeds of loan for smallpox expenses and smaller amounts, making a total of \$855,876. The total estimated expenditure was \$805,267.

Prohibition and Temperance.—In response to a memorial presented to the Government by a large number of residents in the province (9,369) asking for the enactment of a prohibitory liquor law, a reply was made public on May 12. Reference was made to the uncertainty of public opinion upon this subject, as illustrated by the passage of the legislation of 1855 and its subsequent repeal and the recent change in Manitoba. The conclusion was that the Government did not feel warranted at the present time "in engaging to take any action upon the memorial."

Public Works.—Mr. Tweedie pointed out in his budget speech that the province had to maintain under the charge of the Department of Public Works 4,000 bridges, of which 1,165 were in the main roads, with a united length of 166,000 feet, or nearly 32 miles. Altogether there were about 80 miles of bridge work to look after and keep in repair, together with 2,340 miles of main roads and lesser ones; a total of 9,000 miles. Mr. Labilloy, for all these purposes, had \$25,000 a year.

Agriculture.—There were 35 creameries in New Brunswick in 1901, producing 542,626 pounds of butter, worth \$111,043, against 33 in 1900 producing 462,606 pounds, worth \$94,618.

To encourage the milling of the grain at home, the Government offered a bonus equal to 20 per cent. of the cost of the roller-process machinery for every mill constructed in the province, and the outcome of such a policy has been so successful that to-day there are 24 well-equipped flour-mills in the province, turning out from 25 to 100 barrels a day of high-grade flour. Ten years ago New Brunswick imported cheese to the value of \$500,000, while it exported last year cheese and butter to the value of \$1,000,000, the change being secured by the lively interest the local authorities of New Brunswick had taken in establishing cheese factories and creameries throughout the country. There are now 56 in successful operation. The Government gave \$150 to the cheese factories and \$250 to the creameries, each, while the dairy school at Essex was also liberally supported.

NEWFOUNDLAND, colony of, an island near the Atlantic coast of Canada, owing allegiance to the British Crown, but possessed of full self-government. Population, 216,615; area, 42,734 square miles. Capital, St. Johns.

Government and Politics.—At the beginning of 1902 the Government or Executive Council was composed of Sir Robert Bond, Premier and Colonial Secretary; W. H. Horwood, Minister of Justice; E. M. Jackson, Minister of Finance and Customs; and Messrs. E. P. Morris, G. Knowling, A. W. Harvey, H. J. B. Woods, J. S. Pitts, and J. D. Ryan, members without office. Mr. E. Dawe was Minister of Agriculture and Mines; T. J. Murphy, Minister of Marine and Fisheries; and G. W. Gushue, Minister of Public Works, without seats in the Council.

E. D. Shea was President of the Legislative Council, and L. O'B. Furlong, Speaker of the House of Assembly. Some changes took place in the Government and in political circles. On July 15 Sir Joseph Little, Chief Justice of the island, died, and on July 26 Mr. Horwood, Minister of Justice, was sworn in as his successor. At the same time Mr. G. M. Johnson, K. C., retired from the Assembly and became a judge of the Supreme Court, in place of Mr. Jus-

tice Morrison, who retired to advocate confederation with Canada. H. J. B. Woods had already accepted the new office of Postmaster-General. On Dec. 17 Mr. Edward P. Morris, K. C., became Minister of Justice. The by-elections following these changes were not very favorable to the Bond Government, although they could not affect their large majority seriously. On Dec. 2 Trinity District returned 2 Opposition candidates by more than 300 majority to support Mr. A. B. Morine in constituencies that had previously given a Government majority of 700. The reciprocity policy of Sir R. Bond was one of the chief issues. Meanwhile, on Feb. 21, the Legislature had been opened by Gov. Sir Cavendish Boyle, in a speech foreshadowing measures to preserve the whale fisheries, establish cold storage for fishing products, reform the municipal system in St. Johns, protect railway employees, and encourage iron-mining. After some stormy scenes and the passage of a series of enactments covering many important interests, the Legislature was prorogued on April 22. The following bills were approved by the Governor:

Newfoundland French treaties act.
 Patents (amendment) act.
 Registration of deeds (amendment) act.
 Warehouse receipts (amendment) act.
 Bank fishermen insurance (amendment) act.
 Whaling industry act.
 Shipbuilding (amendment) act.
 Duties on foreign-built vessels act.
 Grand Bank harbor act.
 Deer preservation act.
 Game preservation act.
 Customs (amendment) act.
 Revenue (amendment) act.
 Duties (reduction of) act.

In July Sir Robert Bond went to the coronation in England, took part in the Colonial Conference, and was made a member of the imperial Privy Council.

Finances.—The budget speech of the Minister of Finance was delivered in the House of Assembly on March 25. For the year ending June 30, 1901, he placed the revenue at \$2,060,581, which included \$1,807,951 from customs, \$55,052 from postal service, \$11,795 from Crown lands, \$4,640 from liquor licenses, \$6,673 from inland stamps, \$6,454 from foreign fishing licenses, \$4,885 from penitentiary labor, \$25,000 interest on municipal debt, and \$47,231 from miscellaneous sources. The expenditures were \$2,024,952.

He said the public debt was \$17,378,419, and pointed out that the customs revenue had risen from \$1,502,588 in 1896-'97 to \$1,897,951 in 1900-'01, and the total revenue from \$1,610,788 to \$2,060,581. The estimated receipts for the year ending June 30, 1903, were given at \$2,096,000, including \$1,875,000 from customs, \$60,000 from postal services, and \$40,000 from municipal debt interest. The estimated expenditures to be voted by the House were \$1,123,511, and those already authorized by statute were \$952,539. The authorized sums included \$150,268 for education and \$743,755 for interest on the public debt and its management. The revenue for the year ending June 30, 1902, was \$2,200,000.

Trade and Commerce.—The year 1901 was a most exceptionally prosperous period in the colony, and 1902 was not behind it. The imports increased from \$5,929,768 in 1896-'97 to \$7,359,442 in the year ending June 30, 1901. The exports increased from \$4,917,785 to \$8,320,809. The imports in the latter year included beef (salted) to the value of \$183,495, butter \$99,360, coal \$330,097, flour \$1,167,434, cottons, woolens, silks, and

linens \$1,126,396, leather and leather ware \$259,245, iron railway material, etc. \$681,263, molasses \$326,256, pork \$360,918, salt \$126,317, sugar \$125,021, tea \$162,445, tobacco, wines, and spirits \$94,369. The exports were as follow: Dry codfish \$5,171,910, herring \$231,413, salmon \$139,101, lobsters \$448,501, cod-oil \$398,039, seal-oil \$424,632, sealskins \$282,895, copper \$390,779, iron ore \$455,554, lumber \$63,299.

Banking and Insurance.—In his budget speech the Finance Minister said the Government savings-bank deposits had increased from \$1,103,788 on Dec. 31, 1899, to \$1,296,040 on Dec. 31, 1901. He said also that the public was insured to the amount of \$5,686,366 in insurance companies, and paid premiums to the extent of \$245,834.

Temperance.—In 1866, when the population was about 140,000, there were 6,477 gallons of brandy, 4,201 of whisky, 120,722 of rum, 11,955 of gin, and 11,077 of wine and champagne consumed in the island. In 1900, with a population of more than 200,000, the figures ran as follow: Brandy, 3,780 gallons; whisky, 16,126; rum, 41,453; gin, 2,096; and wine and champagne, 6,559. Ale, beer, and porter rose in the same period from 37,496 to 62,245 gallons.

Population.—The census returns for 1901 were presented to the Legislature by Sir R. Bond on March 3, 1902. They showed a total population of 220,249, including 3,634 for the dependency of Labrador, on the coast of Canada. In 1891 Newfoundland had 197,930 inhabitants, and Labrador 4,106. The chief denominations were as follow in the two periods: Catholics, 72,696 in 1891 and 76,209 in 1901; Anglicans, 69,834 in 1891 and 72,650 in 1901; Methodists, 54,276 in 1891 and 60,812 in 1901. The Salvation Army rose from nothing in 1891 to 6,500 in number. According to official figures published in June, 1902, the births in the island in the previous year were 6,810, an increase of 211; the marriages were 1,781, a decrease of 83; the deaths were 3,865, an increase of 840. The birth-rate was 30.91 per 1,000, the marriage-rate 7.85 per 1,000, the death-rate 17.54 per 1,000.

Mines and Minerals.—The total value of the output in 1901 of the crude materials at the mines and quarries amounted to \$1,211,163, an increase over the previous year's output of \$319,154. The main factor in bringing about this result was the large production of iron ore at the Bell island mines, 738,206 tons. Estimated at \$1 a ton, this shows a total value only \$53,893 short of the entire value of all the minerals raised in the colony in 1900. The statement of the products for 1901 is as follows: Brick, 1,305,000 pieces, valued at \$13,500; building-stone, 5,500 tons, \$5,500; copper ore, 73,348 tons, \$360,000; granite, 3,240 tons, \$19,710; iron ore, 738,206 tons, \$738,206; limestone, 1,300 tons, \$975; paving-stone, 140,000 pieces, \$14,128; pyrites, 7,522 tons, \$37,128; slate, 2,000 tons, \$22,800; total value, \$1,211,163. The brick, building-stone, granite, limestone, and paving-stone were used in the colony, and the copper, iron and pyrite ores, and the slate were exported to Europe and America. Of the copper ore, 36,641 tons went to Britain, 35,767 tons to New York, and 540 tons to Pictou, Nova Scotia. Of the iron ore, 35,830 tons went to Britain, 213,385 to Germany, 408,617 to Canada, and 76,860 to the United States. New York took all the pyrites, and the entire export of slate went to England. The copper-ore output increased by 5,000 tons.

Fishing.—The Banks fishery for 1901 employed 118 vessels of 5,282 tons, with 1,531 men,

and produced a catch of 113,841 quintals of cod-fish. The seal fisheries for the same season had 19 steam-vessels engaged, with a tonnage of 5,998 and crews numbering 3,836. The seals taken numbered 291,217, valued at \$425,355. The increased value of the catch in 1902 was due to the better price that the men secured as a result of their strike before the fishery began. They had been receiving \$3.25 a quintal (112 pounds) for their share of the catch, with a deduction of \$3 a man for equipping the ship, locally known as "berth money." They demanded and were conceded \$3.50 a quintal, and the abrogation of the "berth-money" charge. The sealing voyage occupied 20 steamers and 4,000 men less than eight weeks.

Lobster fishing is a decaying interest here. There were 1,440 factories on the coast in 1901, and for their protection against the illegal selling of bait to French fishermen the colony maintained 50 wardens, 2 steamers, and several smaller vessels. The staple product of Newfoundland is cod, and it concerns three-quarters of the population and constitutes five-eighths of the exports. With certain products of the cod, the total value of the industry was \$5,570,756. Other fish exports included haddock to the value of \$252,508; herring, \$171,501; lobsters, \$448,501; salmon, \$146,066; whale-oil, etc., \$67,785.

Education.—The system of education in Newfoundland includes a Council of Education made up of various denominational head masters of schools and clergymen as superintendents, with the Rev. Canon Pilot as president. There is a Church of England college, and Roman Catholic, Methodist, and Presbyterian colleges, and various denominational boards of education in each district. Each denomination has its own schools and scholastic machinery, and receives a per capita grant from the state for their maintenance. After every census there is a readjustment, and the moneys are appropriated in accordance with the population statistics then shown. The state interferes in no way except to provide for an inspection of the schools, and even the practical management of this matter is left to the heads of the religious bodies. The annual vote for education is \$160,000, or 75 cents a head of the total population. It costs \$3.80 a year for every pupil enrolled, and in the smaller settlements there are no schools. The subdivision of the grants among the denominations is largely responsible for this.

Each of the three principal denominations is allowed a superintendent and an assistant, and the salary of the chiefs is \$1,600, and of the aides \$600. In that of the Catholics, however, they have been permitted to have one superintendent for the diocese of St. Grace and a second for the dioceses of St. John's and St. George's. The former gets \$1,000 and the latter \$1,500. The Anglican and Methodist chiefs inspect the schools of the minor Protestant denominations each year, alternately, for which they receive a special allowance, or else the work is done by the ministers of those churches, who receive that sum instead. The school boards of each creed have jurisdiction over the harbor or settlement for which they are appointed, and they determine all matters relating to education therein, the clergyman usually enjoying practically autocratic powers. The total expenditure for education in 1899-1900 was \$155,021, and in 1900-'01 it was \$158,238. A measure was presented to the Legislature during the session changing certain details of the system. In the Council, on April 9, the Hon. Mr. Knowling gave the following explanation of its terms:

"This bill is intended to place the education grant in proportionate ratio to the increase of population. It amends the former act so as to include the Salvation Army in its provisions, and in order to make a pro ratio division of the grant. Having regard to the allocation of \$25,297.87, an alteration of the act was necessary in order to apportion the amount equitably among the teachers of certain services."

Union with Canada.—This question was widely discussed in Newfoundland, with mixed feelings; in Canada with almost unmixed approval. Speaking at Halifax on March 25, the Hon. A. M. McKay, one of the four Opposition members of the Assembly, made the following statement as to the feeling on the island: "I think it is not nearly as hostile as in times past. In 1896, when federation was a live question, the people of Newfoundland felt that if they entered the confederation they would be a subordinate colony, and the loss of their autonomy and self-government would lessen their importance as a colony. That probably is the opinion to-day in a lesser degree. It is of course the sentimental aspect, but that is the view that weighs with the mass of the people. It is not a party question."

At the end of April Mr. Justice Morrison resigned from the bench and contested the elections as leader of a party in favor of confederation. He and Judge Seymour, of St. John's, visited Ottawa and other Canadian cities, and were very clear in their advocacy of union. On his return Mr. Morrison told the St. John News (June 16) that the question would have to be settled at the polls. "As you know, I have always been in favor of closer political and commercial relations with Canada, if satisfactory terms could be arranged. Both countries have something to gain from a fair bargain, and, so far as I can see, nothing to lose. Every year the arguments for union grow stronger, and it seems to me only a question of time when the two countries must come together." Sir R. Bond, the Premier, meanwhile took ground against confederation, and proceeded to negotiate his reciprocity treaty at Washington.

The Reciprocity Treaty.—In the summer and autumn, with Mr. Chamberlain's consent and the support of the British ambassador at Washington, Sir R. Bond negotiated with Secretary Hay a treaty of reciprocity somewhat according to his old arrangement. The chief difference was the absence of the preferential clause, so obnoxious to Canada and imperial ideas, in the one that was disallowed in 1895. The following were the terms of the new treaty: Article I provided that American fishing-vessels entering Newfoundland waters could buy bait on the same terms as Newfoundland vessels. They could also touch and trade, buy and sell fish and oil, and procure supplies without other charge than the payment of the light, harbor, and customs dues levied on Newfoundland fishing-vessels. Under Article II salted codfish, cod, seal, and whale oil, unmanufactured whalebones, sealskins, herrings, salmon, trout, salmon-trout, lobsters, cod roes, tongues and sounds, the produce of fisheries carried on by fishermen of Newfoundland, metallic ores, the product of Newfoundland mines, and untrimmed slates were to be admitted into the United States free of duty. Unsalted or fresh codfish were not included. On the other hand, Newfoundland was to admit free of duty from the United States a long list of articles. Newfoundland was to give to the United States as low duties on any article as she gave to any other country. The treaty, if ratified, was to remain in force five years. The arrangement was opposed by the Maine Senators

and Representatives on the ground that its terms injured the interests of the 31,000 men engaged in the New England fishing industry. The Newfoundland fish in American markets would, it was asserted, unduly cheapen salted fish to the American consumer. The treaty went to the United States Senate, and at the end of the year had not been ratified.

NEW HAMPSHIRE. (See under UNITED STATES.)

NEW JERSEY. (See under UNITED STATES.)

NEW MEXICO. (See under UNITED STATES.)

NEW YORK. (See under UNITED STATES.)

NEW YORK CITY. Government.—The city officers during the year were: Mayor, Seth Low; President of the Board of Aldermen, Charles V. Fornes; Borough Presidents—Manhattan, Jacob A. Cantor; Brooklyn, J. Edward Swanstrom; Queens, Joseph Cassidy; Bronx, Louis F. Haffen; and Richmond, George Cromwell—all of whom were elected on the Fusion ticket, having been nominated by the Republican party and accepted by the Citizens' Union and the Greater New York Democracy, except Joseph Cassidy and Louis F. Haffen, who were Tammany candidates, and took office on Jan. 1, 1902. Also there are the following county officers: County Clerk, Thomas L. Hamilton; District Attorney, William T. Jerome; Sheriff, William J. O'Brien; and Register, John H. J. Ronner—all of whom were Fusion candidates and took office on Jan. 1, 1902.

Finances.—The gross funded debt of the city of New York, Jan. 1, 1902, was \$416,262,223.61, an increase of \$26,356,324.22 over that of 1901. Deducting from this amount \$4,322,997.69 of special revenue bonds and \$126,340,920.47, the amount of all sinking-funds, including both investments and cash, the net permanent funded debt is shown to be \$285,598,305.45, an increase of \$20,332,329.54 for the year 1901. In addition to revenue bonds issued in anticipation of the collection of taxes, bonds were issued to a little more than \$42,500,000, and there were redeemed bonds amounting to \$16,500,000. The net growth of the sinking-funds during the year, \$7,000,000, has offset more than 25 per cent. of the gross increase of the permanent funded debt. When it is considered that almost all the bonds issued in 1901 run forty or fifty years, and that in this sum are included \$11,000,000 issued for the rapid-transit railroad, which will be redeemed out of the earnings of the road itself, it is clear that the growth of the sinking-fund, as a whole, is out of all proportion to the actual requirements of the debt. It is estimated that in fifty years, the time for which the longest city bonds are made to run, even at the present annual rate of increase, the increase of the sinking-funds would redeem \$750,000,000 of debt, without regard to the capital of the sinking-funds; whereas at the present time the gross funded debt is only \$416,000,000 and the net permanent funded debt is less than \$286,000,000. The tax rate adopted by the Board of Aldermen on Aug. 21, for 1902 was: Manhattan and Bronx, \$2.27 for each \$100 of assessment. The rate for 1901 was \$2.31. For Brooklyn the rate was \$2.35; Queens, \$2.31; and Richmond, \$2.33. The amounts to be raised by tax were: City budget, exclusive of State taxes, \$89,695,395.79; State taxes, \$4,515,509.29. County budgets: New York, \$2,295,708.75; Kings, \$1,182,790.50; Queens, \$144,474; Richmond, \$63,755; total, \$97,897,633.33. From this should be deducted general fund balances, miscellaneous receipts, and other items estimated at \$11,396,711.67; balance, \$86,500,921.66. To this must be

added the estimated 2-per-cent. deficiency for non-collected taxes of \$1,730,018.42, making the net amount to be raised by tax in the 5 boroughs, \$88,230,940.08.

Taxes and Assessment.—These are in charge of the department of which James L. Wells is president. The other members were Edward C. Sheehy, Arthur C. Salmon, Thomas J. Patterson, who died in 1902, and Ferdinand Levy (salaries \$7,000 each except the president, who receives \$8,000). They report the total valuation of real estate and personal property assessed in 1902 to be \$6,594,907,471, against \$6,357,767,043 for 1901, an increase of \$237,150,428. This amount was distributed as follows: Assessed value of real estate: Manhattan, \$2,196,571,028; Bronx, \$145,050,173; Brooklyn, \$633,780,958; Queens, \$104,131,496; Richmond, \$37,588,014; total, \$3,122,121,669. Assessed value of personal estate: Manhattan, \$2,995,684,916; Bronx, \$43,593,045; Brooklyn, \$365,823,341; Queens, \$32,697,900; Richmond, \$34,986,600; total, \$3,472,785,802; grand total, \$6,594,907,471. Real estate of the appraised value of \$500,000,000 in New York County is exempt from taxation. Thus Mulberry Bend Park is estimated to be worth \$1,000,000, and Paradise Park near by is valued at only \$90,000. The valuation of the land of the Cathedral of St. John the Divine is \$2,200,000, of St. Patrick's Cathedral and its site \$3,600,000, of Trinity Church and its cemetery \$6,000,000. The most valuable exempt site in the Bronx outside of its parks is Woodlawn Cemetery, valued at \$2,250,000. The Jerome Park reservoir is valued at \$2,000,000, New York University at \$400,000, the Washington Bridge at \$250,000, and the Third Avenue Bridge at the same figure. The present Custom-House is valued at \$2,800,000, Fulton Market at \$500,000, the Criminal Courts Building at \$1,500,000, the Henry Street school at \$350,000, St. Mark's Church and cemetery on Second Avenue at \$192,000, the Astor Library at \$250,000, Cooper Union at \$600,000, the Blind Asylum at 34th Street and Ninth Avenue at \$825,000, the Ninth Regiment Armory at \$500,000, the State arsenal, 35th Street and Seventh Avenue, at \$600,000, the Masonic Temple at \$1,000,000, Bellevue Hospital at \$1,600,000, Roosevelt Hospital at \$825,000, Normal College at \$900,000, Presbyterian Hospital at \$1,200,000, St. Luke's Hospital at \$1,500,000, and General Theological Seminary at \$1,250,000.

Board of Estimate and Apportionment.—This body consists of the Mayor, the Comptroller, President of the Board of Aldermen, and presidents of the boroughs. This board allowed the following-named amounts for 1903: The mayoralty, \$59,300; Board of Aldermen and city clerk, \$153,152; Department of Finance, \$983,280.60; interest on the city debt, \$13,276,709.68; redemption of the city debt, \$10,417,359.17; State taxes, \$550,157.28; rents, \$352,095.07; Law Department, \$460,560; President of Borough of Manhattan, \$1,705,430.50; President of Borough of the Bronx, \$1,026,000; President of Borough of Brooklyn, \$1,164,260.25; President of Borough of Queens, \$769,308.63; President of Borough of Richmond, \$372,980; Department of Bridges, \$423,038.38; Department of Water-Supply, Gas, and Electricity, \$4,582,852.23; Department of Parks, \$1,982,333.95; Department of Public Charities, \$1,802,490.16; Bellevue and allied hospitals, \$595,580.78; Department of Correction, \$791,072.50; Department of Health, \$1,034,391.48; Tenement-House Department, \$466,433.08; Police Department, \$11,566,680.42; Board of Elections, \$838,275; Department of Street Cleaning, \$5,362,112.20; Fire Department, \$5,218,300.28; Department of Taxes

and Assessments, \$349,900; Board of Assessors, \$30,300; Armory Board, \$107,807.50; Department of Education, \$20,063,017.77; College of the City of New York, \$298,362; Normal College of City of New York, \$220,000; coroners, \$151,300; Commissioners of Accounts, \$151,000; Civil-Service Commission, \$100,000; Board of Civil Record, \$518,800; Examining Board of Plumbers, \$5,154; for library purposes, \$431,543.80; City Court of New York, \$136,050; municipal courts, city of New York, \$392,250; Court of Special Sessions, First Division, \$96,150; Court of Special Sessions, Second Division, \$54,400; City Magistrates' courts, First Division, \$166,450; City Magistrates' courts, Second Division, \$172,800; for charitable institutions, \$2,728,264.04; miscellaneous, \$1,268,264.21; total, \$93,395,966.96. Also the budget shows an allowance for the County of New York, \$2,327,781.21; the County of Kings, \$1,174,305.89; the County of Queens, \$157,366.68; the County of Richmond, \$63,610.36; making a grand total of \$97,119,031.10, which is a net decrease of \$1,500,569.78 over that of last year.

Parks.—The public parks are under the care of commissioners appointed for the various boroughs, with a salary of \$5,000 each. The incumbents during the year were: Manhattan and Richmond, William R. Willcox; Brooklyn and Queens, George V. Brower; Bronx, A. Moebus.

On July 1, Coney Island Park, which is at the terminus of the Ocean Parkway on Coney Island and comprises 70 acres, was formally opened to the public. Calvin Tompkins, chairman of the Municipal Art Society, chairman of the ceremonies, began the exercises by the following account of the work: "On April 18 the Board of Estimate and Apportionment granted the Park Department \$50,000, with the request that it be devoted to improving this part of the city. On May 17 the serious work began, and in forty-three days this park has been made; the barren waste has become a beautiful garden; the sand hills have become a park, in which are found the plants of the tropics, flowers, trees, and shrubs. An irrigation plant has been put in, and nearly 15,000 cubic yards of soil, and about 1,200 trees, shrubs, and plants are growing here to-day."

On July 11, Thomas Jefferson Park, between 111th and 114th Streets and First and Pleasant Avenues, was opened by Park Commissioner Willcox. The park now contains 9 acres, but it is to be extended to the Harlem river front, giving it about 15 acres and including in its boundaries the recreation pier at 112th Street. The park is in a barren condition at present. It is enclosed by a fence, and is divided into two sections, one section, 260 by 603 feet, being devoted to a playground for children, with tents and settees. The other section is for a ball-ground. It is in a section of Harlem that is known as "Little Italy."

On July 17 the following resolution was adopted by the Sinking-Fund Commissioners and the Committee of Public Buildings, Markets, and Supplies of the Board of Aldermen: "The interests of the city require the removal from the City Hall Park of the Hall of Records, the engine-house and hook-and-ladder company, and the brownstone building occupied by the City Court as soon as suitable arrangements can be made for the accommodation of the occupants of these buildings elsewhere, and that the space occupied by these buildings be added to the City Hall Park."

In December plans for the extension of Riverside Drive were published. These have for their

chief purpose the carrying of the driveway to Boulevard Lafayette. The extended driveway is to begin at 135th Street, with an elevation of 80 feet above the river. Traversing the old Otten-dorfer property, it will cross 138th Street at a grade that will permit the street to pass below. The bridge over the street will be of masonry of artistic design. Its abutments will contain public-comfort houses. From the bridge the route swings gradually to the west, approaching closely to the tracks of the railway, but at such a height that the prospect of the river and the cliffs beyond is not shut out. Leaving the estate of Robert Hoguet on the right, the roadway at 143d Street broadens until its width is nearly 300 feet. Between 145th and 155th Streets are to be 3 bridges of ornate design, to carry the driveway across intersecting streets that fall below the grade of the new thoroughfare. The most elaborate of these bridges will be at 155th Street. It will form a series of masonry arches and will be at an elevation of 60 feet. An inclined approach on the north side will connect the drive and the street. Passing through Audubon Park, the extension crosses over 158th Street to the Boulevard Lafayette. The approach widens, forming a plaza corresponding, to some extent, with the entrance to the viaduct north of Claremont. The general plan of the extension provides for a carriage road 60 feet wide, a bridle-path 20 feet wide, two walks of 15 feet each, and grass-plots 5 feet wide between roads and walks. The carrying out of the plans will provide a pleasure drive-way from Central Park West, through Riverside and the Boulevard Lafayette to Dyckman Valley, and back by the Speedway and St. Nicholas Avenue, in all a distance of 15 miles.

Museum of Art.—A new wing of the Metropolitan Museum of Art, on Fifth Avenue and 81st Street, was formally opened on Dec. 22. The new building, owing to its position on Fifth Avenue, forms a natural entrance to the museum, and the stately and impressive portal is regarded as worthy of the largest collection of works of art in the country. In the great entrance hall have been arranged a series of modern bronzes and marbles, as well as many of the sarcophagi from Cyprus. In the long narrow galleries are steles, reliefs, pottery, seals, and tomb inscriptions from Palmyra, Etruscan pottery, and bronzes, Greco-Roman masks, and Egyptian antiquities. The Elizabeth Cole tapestries and an Italian eighteenth-century tapestry are shown in one wing of the new building. In the upper galleries are Chinese bells, the Phenix collection of Chinese and Japanese lacquers, the Marquand porcelains, and the jades from the Bishop collection, as well as the porcelains from China, loaned by J. Pierpont Morgan.

Aquarium.—On Oct. 1 this institution, which has been in the custody of the Park Department since its inception, was formally transferred to the custody of the New York Zoological Society, although the municipality will continue to provide the funds for its maintenance. Park Commissioner Willcox, in making the transfer, told how the building had been erected originally upon the rocks and connected with the shore by a bridge, and how the structure had been used successively as a battery, a place of amusement, and a landing-place for immigrants, until in 1896 it was opened to the public as an aquarium by the Department of Parks. Charles H. Townsend, the new director of the Aquarium, formerly a member of the United States Fish Commission, said in part: "The possibilities of an aquarium as an institution for the instruction of the people

THE NEW WING OF THE METROPOLITAN MUSEUM OF ART.

have never been properly understood. What we want to do is to make it a part of the city's educational system. It should be a place for study and investigation. Fish-culture is fast becoming a profession. We could establish a fish-hatchery in the building. This would be interesting, and it could be arranged with glass sides, so that the fish could be seen."

Health.—The collecting of vital statistics is under the care of three commissioners, including the health-officer of the port and the police commissioner. The officials for 1902 were Ernest J. Lederle, president (salary \$7,500), Health-Officer Dr. Alvah H. Doty, and Police Commissioner John N. Partridge. The secretary of the board was Emmons Clark, who was retired on Dec. 24, 1901, and was succeeded by Caspar Golderman, and the office is on the corner of Sixth Avenue and 55th Street. President Lederle's report shows that the number of deaths was 68,082, compared with 70,808 in 1901, and the death-rate for 1902 was 18.74 a thousand—the lowest ever reported in this city. The annual death-rate for the entire city since consolidation has been: 1898, 20.26; 1899, 19.47; 1900, 20.57; 1901, 20.02; and 1902, 18.74. In 1892 the rate for the old city was 25.95. The death-rate for 1902 for the old city of New York was 19.49. In 1902 there were 4,907 more births than in 1901; and 36,200 marriages, an increase of 2,653. Regarding consumption, the report shows that there were 582 fewer deaths than in 1901. The decrease in the death-rate from this disease is due to scientific measures and "the control of the white plague and its ultimate eradication" is being brought about by the enforcement of sanitary measures. There was a slight increase in the deaths from typhoid fever, but a decrease of 100 deaths from smallpox is noted. In scarlet fever there was a slight increase in the number of deaths, but in diphtheria there was a decrease of 35 per cent. For the first time in twelve years there was a decrease in the death-rate from cancer. There were 800,000 persons vaccinated in the year. The coroners' report shows that their office considered 6,346 deaths, distributed as follows: Sudden deaths from natural causes, 3,526; deaths by accidental violence, 1,965; deaths by suicide, 470; deaths by direct murder, 92; other homicide cases, 139; ante-mortem statements, 154. Of these, there were 482 cases remaining for inquiry from the previous year. In all there were in 1902 2,820 deaths that, under the law, require the personal investigation of the coroners. As a result of such investigations, 543 persons were held to await the action of the Grand Jury. In connection with this, 1,236 inquests were held and 644 autopsies were performed.

Hospitals.—In accordance with the provisions of the revised charter for the city, on Feb. 1 the charge of the receiving and emergency hospitals passed from the control of the Charities Department to a board of trustees consisting of Dr. John W. Brannon, president; James K. Paulding, secretary; Myles Tierney, Samuel Sachs, Marcus Stine, Theodore E. Tack, Howard Townsend, and Commissioner of Charities Homer Folka, *ex officio*. The board will hold meetings in the Medical Board Room at Bellevue, and its annual meetings and election of officers will be held every February. It is required by law to make an annual report to the mayor in December. The emergency and receiving hospitals included under the new management with Bellevue are Fordham, Gouverneur, Harlem, the Emergency Hospital in 26th Street, and the new hospital in Harlem, ground for which has been secured.

Police.—This department is under the control of a commissioner (salary, \$7,500) and two deputy commissioners (salary, \$4,000). In 1902 the commissioner was John N. Partridge, who resigned on Dec. 12, and was succeeded by Francis V. Greene. The first deputy was N. B. Thurston, who resigned on Oct. 4, and was succeeded by Second-Deputy F. H. E. Ebstein, who in turn was succeeded by A. R. Piper. The headquarters are at 300 Mulberry Street. Col. Partridge's report to Dec. 1 shows: Total force on Nov. 30, 7,721; retirements, 115; dismissals, 76; complaints for violations of rules, 2,993; tried and reprimands given, 764; fines imposed, 1,463; tried and fines remitted, 4; tried and judgment suspended (debts), 34; tried and judgment reserved, 78; pending, 155; total arrests—all offenses, 134,283; arrests for gambling—all kinds, 1,434; arrests for keeping gambling houses, 155; arrests for blackmail, 13; arrests for bribery, 14; arrests for keeping disorderly houses, 506; arrests for murder, 20; arrests for violating liquor-tax law, 1,895; arrests for violating policy law, 140; and arrests for violating pool law, 273.

The charges of oppression brought against Chief Devery by former Officer O'Neill were dismissed in the Court of Special Sessions, and in consequence the district attorney did not pursue the matter further. The McAuliffe mystery was one of the police events of the year. James McAuliffe was the principal witness on whose testimony Wardman Glennon was convicted. On Feb. 16 he stumbled and fell forward on his face in the street before several witnesses, and died shortly afterward in the hospital. Two days later it was learned that he had been in the hands of the West 47th Street police during the night previous to his fall, and the hospital authorities declared that the fracture of the skull from which he died could not have been obtained from his fall on the face, in consequence of which a belief grew up that he had been badly used in the station-house. As he was a strong witness against 5 other indicted police officers, the local newspapers took up the matter, and \$4,000 was offered as a reward for the apprehension of his murderers. Public opinion compelled the Police Department to make an investigation and the district attorney to make an inquiry, and it was officially conceded that when McAuliffe was arrested Saturday night he was not suffering from the injury that caused his death, and that the injury received by him after his liberation Sunday morning was not sufficient to cause his death. But no evidence was obtainable to prove beyond reasonable doubt who inflicted the injury.

Fire.—This department is under the care of a commissioner, who receives a salary of \$7,500. The present incumbent is Thomas Sturgis, and the headquarters are at 157 East 67th Street. The most important action taken in the Fire Department during the year was the order issued on Aug. 19 relieving Chief Croker from command, and assigning his duties to Deputy-Chief Purroy. Charges were then preferred against Croker, and he was tried on 7 counts, embracing 15 specifications, most of which pertained to his neglect to safeguard the Park Avenue Hotel by enforcing legal requirements, and to his discriminating in promotions in favor of men of certain political organizations. These charges were sustained, and he was found guilty, in consequence of which he was dismissed from the service on Nov. 28.

Education.—At the beginning of the year the Board of Education consisted of 20 commissioners, who were appointed by the Mayor and received no salary; and of that body Miles M. O'Brien was president. By virtue of the laws

of 1901 this organization was abolished on Feb. 3, 1902, and a new board was appointed, of which Charles C. Burlingham was chosen president. The borough superintendent is William H. Maxwell; and John Jasper, formerly superintendent, but more recently an associate superintendent, was retired with a pension, to take effect Sept. 1, 1902. The headquarters are at the corner of Park Avenue and 59th Street. According to a report issued on Sept. 10, the school attendance on Sept. 8, in Manhattan was 203,500; Bronx, 36,110; Brooklyn, 123,181; Queens, 24,901; Richmond, 8,703; total, 396,425. Increase over first day, 1901; Manhattan, 17,616; Bronx, 4,379; Brooklyn, 12,748; Queens, 1,327; Richmond, 429; total, 36,499. Number over six years refused admission: Manhattan, 890; Bronx, 14; Brooklyn, 1,003; Queens, 4; Richmond, 20; total, 1,931. President Burlingham said: "While thousands of children are deprived of a full day's schooling, there are thousands of unoccupied seats in the schoolhouses of this city. This is due in part to a shifting of population. It is impossible to move little children, but the older pupils of the schools can be transported and put in less crowded schools. In the outlying districts of the Bronx we make contracts for carrying the children in stages. I see no reason why we should not enter into contracts with the city railway companies to carry children from the congested to the less crowded parts of the city."

Carnegie Libraries.—The trustees of the New York Public Library and of the committees in Brooklyn and Queens of the Carnegie Library fund recommended in March to the Board of Estimate the following sites for Carnegie libraries:

Manhattan and Bronx.—Nos. 29, 31, and 33 East Broadway; price asked \$102,000. A plot on the southerly side of 82d Street, 100 feet east of West End Avenue; price asked \$47,000. On the southerly side of 138th Street, 175 feet east of Lincoln Avenue; price asked \$20,000. Tremont, near the Harlem Railroad station and the borough building. Nos. 224, 226, and 228 East 125th Street, to be acquired by condemnation at an estimated cost of \$17,000 or \$18,000.

Brooklyn.—Entire block bounded by Marcy Avenue, Rodney Street, and Division Avenue; estimated cost, \$50,000. Vacant plot in Franklin Avenue, opposite Hancock Street, between Fulton Street and Jefferson Avenue; price asked \$25,000. Vacant plot on northwest corner of Clinton and Union Streets; price asked \$26,000. Plot on southeast corner of Fourth Avenue and Pacific Street; price asked \$30,000. Plot on south corner of Bushwick and De Kalb Avenues; price asked \$30,000. Northwest corner Norman Avenue and Leonard Street; price asked \$36,000. Southwest corner of Fourth Avenue and 51st Street; price asked \$12,500.

Queens.—Southeast corner of Broadway and Cook Avenue, in the old village of Elmhurst, now part of the Second Ward of Queens. Northwest corner of First Avenue and 13th Street, in the old village of College Point, now part of the Third Ward of Queens. Northeast corner of Broadway and McCormack Avenue, in the old village of Ozone Park, now part of the Fourth Ward of Queens.

A site on East 79th Street, between Second and Third Avenues, having been acquired by the Board of Estimate in 1901, and a building of Indiana limestone having been erected, the first of the series of Carnegie libraries was dedicated on Dec. 13. The building is constructed in conformity with the general type adopted by the

Advisory Board of Architects appointed by the Board of Trustees, under the provisions of the Carnegie gift. It is a three-story and basement structure, 40 by 90 feet, having on its roof a fourth story for the janitor's use. It cost, with equipment, \$70,000.

Rapid Transit.—The charge of the rapid-transit movement is in the hands of a commission, consisting of Alexander E. Orr, president; Woodbury Langdon, Morris K. Jesup, George L. Rives, who was succeeded on Jan. 1 by John Claffin, J. H. Starin, Charles S. Smith; the Mayor and the Comptroller, *ex officio*. In July the Rapid-Transit Commission submitted to the Mayor an extensive report, describing the work accomplished by the commission up to Dec. 31, 1901, and about the same time an unofficial report was made, showing that the subway had been more than half completed. The statement was made that more than two-thirds of all the rock and earth excavation had been completed, and of the earth alone 80 per cent. had been removed. The total amount of earth excavation called for was 1,700,000 cubic yards; earth already excavated, 1,327,000 cubic yards; total amount of rock excavation called for, 1,300,000 cubic yards; rock already excavated, 862,000 cubic yards. Of the 65,000 tons of structural steel necessary for the whole work, 36,076 tons have been delivered, and 16,000 tons have been erected. If this progress is continued, it is estimated that the entire work will be completed in August, 1903, and therefore the statement that passenger service will be in existence on Jan. 1, 1904, was warranted. In May Chief-Engineer Parsons was requested to make a report, involving the building of a complete system of roads connecting all the boroughs, and an offer has been made to the commission to provide money for any tunnels the city may desire to build for itself in the future. The building of a subway to connect with Brooklyn was decided upon. Also the extension of rapid transit to Staten Island has been presented before the commission, and plans submitted, connecting Long Island with Staten Island by means of a tunnel at Fort Hamilton. An announcement was made on Nov. 26 that the Interborough Rapid-Transit Company, which controls the railways that will be operated in the subways, had leased the elevated railways, covering all the franchises and property of the Manhattan Railway Company, for nine hundred and ninety-nine years, the lease to take effect on April 1, 1903.

Tunnels.—The commissioners appointed in September, 1901, to report on the feasibility and desirability of the proposed Brooklyn-Manhattan rapid-transit road, recommended the plans prepared by the Rapid-Transit Commission, which show that it is to run under Broadway from the City Hall, south, and through a tunnel beneath the East River. This report says there was no opposition, even from abutting owners, to the route proposed, and the testimony showed that the general public was satisfied that this was the best route that could have been selected, and the commission finds that the cost of the road as planned is safely within the statutory limits. Bids for this work were called for by the Rapid-Transit Commission, and were opened on July 21. On July 24 the commission, after an extended public hearing, awarded the contract for the tunnel, by means of which the subway rapid-transit system is to be extended to Brooklyn, to the Belmont-McDonald syndicate. The tunnel is to be built for \$2,000,000, and the terminals for \$1,000,000 additional. The commis-

sion also adopted resolutions ordering plans for a second tunnel, and for extensions and terminals that will reach the main centers in Manhattan and Brooklyn and establish the best possible interborough communication.

The New York Central Railroad announced plans for the improvement of the tunnel under Park Avenue, which contemplate a change in the location of Park Avenue, below 56th Street, or south of the present southern end of the tunnel, and it is the intention of the railroad to ask the city to exchange what is now Park Avenue for a similar amount of land which the company has purchased west of the present avenue. This strip of land is to be made into a new Park Avenue, and the present street surface is to be used to extend the tracks of the road in an approach to the loop that is to be built underneath the Grand Central Station. Part of the street so obtained is to be an open cut on a level with the rest of the tracks below the tunnel end. But as the side tracks to be used for the suburban electric system will have to reach a level of 40 feet below the street surface, the down grade leading into the subterranean loop will have to begin near 56th Street, in order to provide a safe grade. It is largely for this that the New York Central acquired the 75-foot strip of land west of Park Avenue, and between 49th and 56th Streets. These improvements contemplate the use of electricity as the motive power, and it is estimated that three years will be required to complete the undertaking.

In April the New York and Jersey City Terminal Underground Railroad Company was incorporated, with a capital of \$100,000, to operate an underground tunnel railroad from a point on the bank of Hudson river at the boundary-line between New York and New Jersey to the intersection of Park Avenue and 57th Street, New York city. The length of the road is to be 6 miles. The road is to be constructed under Hudson river, and under and between the following streets of New York city: From the intersection of West Street and Battery Place, to Greenwich Street, to Trinity Place, to Church Street, to Dey Street, to Broadway and Vesey Street, to Park Row, to Center Street, to New Elm Street, to Great Jones Street, to Lafayette Place, to Astor Place, to Eighth Street, to Ninth Street, to Fourth Avenue, to 42d Street, to Grand Central Station, to Park Avenue, to 57th Street, connecting there with the Harlem Railroad. It was specified that a branch shall be constructed forming a connection with the main line at 34th Street and Fourth Avenue and running under 34th Street to the East river. Subsequently it was announced that this company had bought the rights and property of the Hudson River Tunnel Railway Company, which began the construction of a tunnel under the river, known as the Morton Street Tunnel, and of which more than 4,000 feet have been excavated. The new corporation sought permission from the Rapid-Transit Commission to tunnel from the New York end of the old tunnel up West Street, to Morton, thence to Greenwich, and up to a terminal in the block bounded by West 10th, Christopher, Greenwich, and Hudson Streets.

In September the Hudson and Manhattan Railroad Company, with an authorized capital of \$100,000, was chartered. This corporation contemplates a railroad to begin at or near Pavonia Ferry in Jersey City, running thence southerly to the intersection of Exchange Place and Hudson Street, and thence under the bed of Hudson river to a convenient point on the

boundary-line between New Jersey and New York. The tunnel will run from the intersection of Exchange Place and Hudson Street, southerly and under Hudson Street, to the southerly terminus of the railroad, and thence southerly by the most direct and feasible route to the station of the Central Railroad of New Jersey.

The most important tunnel project brought to public attention during the year was begun with the incorporation, on April 21, of the Pennsylvania, New York and Long Island Railroad Company, with a capital of \$20,000,000, to construct and operate an underground railroad in New York and Queens Counties, to be operated by electricity or other suitable power. This undertaking has for its purpose the carrying of the line of the Pennsylvania Railroad Company across Manhattan Island and establishing a station on the island, at an estimated cost of \$40,000,000, of which about \$25,000,000 will be paid for labor. The new line will begin at Harrison, opposite Newark, and run along the south side of the Pennsylvania main line to a point at which it has such an elevation that it can cross to the north side overhead. Then it trends northward across the meadows to the west side of the ridge just back of Hoboken. On the meadows the line crosses 7 railroads, besides the main line of the Pennsylvania, and an important highway on which is a double-track trolley road, and it also crosses Hackensack river. All the crossings are over grade. That necessitates a continuous embankment, or viaduct, from Harrison to the tunnel portal at the west side of the ridge, about 6 miles. At the Bergen ridge the line enters a rock tunnel, and it emerges in Long Island City, the length of tunnel being a little less than 6 miles. The total improvement from Harrison to the junction with the Long Island Railroad is 12½ miles. Not a foot is on the natural surface; all is in tunnel or cutting, or on embankment or viaduct. Across the North river will be 2 tunnels, and across the East river 4, and the tunnels are to meet at a central station to be established on Manhattan Island, between Seventh and Ninth Avenues and 31st and 33d Streets. On Manhattan Island the rails will never be nearer the surface than 40 feet, and everywhere they will be below mean tide-level. At the highest point of the tunnel the rails will be about 10 feet below mean low water. The station platform will also be below tide-level. Under the Bergen ridge the grade of the tunnel will be 225 feet below the highest point of the hill. Under the North river it will be 35 feet below the natural bottom of the river and 80 feet below mean low water. Under the East river the depths are about the same. The representatives of the Pennsylvania Company came to a speedy agreement with the Rapid-Transit Commissioners, but that contract was rejected by the Board of Aldermen, on the ground that the city's rights were not properly safeguarded. Subsequently a conference was held by Mayor Low and others, at which the proposed franchise was discussed at length. The Pennsylvania Railroad Company agreed to accept some of the modifications that were suggested, and it was proposed that the Mayor send a message to the Board of Aldermen and a similar message to the Rapid-Transit Commission, asking each body to appoint a conference committee for the purpose of developing a possible franchise that would be satisfactory. Conferences and public hearings followed, and after several months' discussion the franchise, amended and revised, became acceptable to the representatives of the railroad, the

Board of Aldermen, and the Rapid-Transit Commission, and finally, on Dec. 16, after recommendation by the Railroad Committee of the Board of Aldermen, the franchise was passed by the larger body and approved by the Mayor. The two points on which the railroad refused to yield were concerning questions of regulating working hours and maintaining a prevailing-rate-of-wages scale. Labor delegates attended every hearing to oppose the granting of the franchise without these stipulations; but the company declared not only its unwillingness, but its inability, to give up on the two disputed points.

Bridges.—On March 18 the Board of Aldermen decided to name the present New York and Brooklyn Bridge the Brooklyn Bridge, the new East River Bridge the Williamsburg Bridge, Bridge No. 3 the Manhattan Bridge, and Bridge No. 4 the Blackwell's Island Bridge. In March the Board of Estimate and Apportionment approved plans for purchase of property 200 feet wide from the terminus of the Williamsburg Bridge on Delancey Street, through the city and across the Bowery to Elm Street, near which point is to be a station of the Rapid-Transit road. Also resolutions appropriating \$1,627,000 for Blackwell's Island Bridge and \$2,290,000 for Manhattan Bridge were adopted. On Nov. 9 a spectacular and unusual fire destroyed the subsidiary woodwork of the tower on the New York side of the Williamsburg Bridge over East river.

Street-Railways.—According to the report issued in December by the State Railroad Commissioners, the surface and elevated railroads of the city of New York carried 924,754,211 passengers paying fares in the year ending June 30, 1902. Counting the transfers, the total number of passengers was 1,160,030,344. The original passengers riding on the cars in Manhattan were distributed as follows: On the street-surface roads, 410,287,089; on the elevated, 215,259,345. As there are no transfers on the elevated, the total transfers on the street-surface roads were 176,726,464. These figures, compared with those of the preceding year, show that the passengers carried decreased 7,895,446 on the street-surface, and increased 25,213,604 on the elevated. The decrease on the street-surface roads of Manhattan and the Bronx was not in original passengers, but in transfers. There are 15 railroad companies operating in the territory of Manhattan and the Bronx, which is an increase of 2. The length of tracks operated is 216,491 miles, against 206,613 miles last year. The surface and elevated roads of Brooklyn carried in the year 357,875,435 passengers, including transfers. The original passengers numbered 299,206,777. The increase was 10,719,524. Eight companies operate the railroads of Brooklyn, which is unchanged from last year. The track mileage this year is 330,317; last year, 328,394.

Municipal Beautifications.—A conference was held on Dec. 6 by representatives of the Merchants' Association, the Manufacturers' Association of New York, the American Society of Civil Engineers, the Architectural League, Columbia University, the National Sculpture Society, and the Municipal Art Society, to consider the question of replanning and beautification of New York city. Among the more important suggestions discussed were: The freight terminal in Communipaw; the tunnel connecting the Pennsylvania and Long Island Railroads; the rearrangement and depression of the tracks of the New York Central and Hudson River Railroad at 42d Street; the union station in the Bronx; the belt-line around the city for freight and pas-

senger traffic; the question of bridges and the planning of suitable bridge approaches; the rearrangement of the elevated system at Battery Park; the rearrangement of City Hall Park; the rearrangement of the northern end of Union Square so as to secure a combined public station and a forum; the possible rearrangement of 34th Street; the rearrangement of the Circle at 59th Street and Eighth Avenue; the treatment of the southern end of Riverside Drive; the treatment of the railroad-tracks and water-front west of Riverside Drive; the placing of suitable isles of safety throughout the city; the proper treatment and placing of monuments; the question of small parks and the rearrangement of the park system; and for the borough of Brooklyn the creation of two grand avenues, one the extension of Flatbush Avenue, to the bridge terminal, the other a new avenue from the Plaza, Prospect Park, through to the north, connecting with Broadway at Flushing Avenue. A recommendation was made for the housing of the various city departments in monumental and important municipal structures, to be situated where they can be seen, at the intersection of the avenues or facing small parks, and a recommendation for the rational decoration and embellishment of such buildings by sculpture, mural painting, etc., the question of such decoration to be considered at the inception of the building by experts, such work to be considered as an integral part of the building, the decoration to be national in character, and so far as possible to represent the art and history of our country.

Monuments.—A heroic statue of Gen. Edward B. Fowler, who was colonel of the Fourteenth New York Regiment during the civil war, was unveiled in Fort Greene Park, Brooklyn. His old comrades and various military associations were present at the ceremonies, which included an oration by Gen. Theodore B. Gates, the acceptance of the statue for the borough of Brooklyn by President Swanstrom, and its acceptance for the city by Mayor Low.

On April 30 the Mary Washington Colonial Chapter of the Daughters of the American Revolution unveiled a memorial tablet to the memory of Margaret Cobin, heroine of the battle of Fort Washington, in Hollywood Church, 181st Street and Broadway, which stands within the line of the old fortifications.

On May 11 the Huguenot Society dedicated a tablet commemorative of the establishment of the first Huguenot church in America. It was placed on the west side of the Produce Exchange court-yard, and is of bronze, with the inscription "Emplacement de la Première Église Française de New York. Original site of the Huguenot Church of New York. Erected by the Huguenot Society of America in 1902." It was presented to the Produce Exchange by President De Peyster, of the Huguenot Society, and accepted by President Barnes of the Produce Exchange.

On May 30, Memorial Day, the Soldiers' and Sailors' Memorial Monument was dedicated. This beautiful memorial, which cost \$300,000, is at Riverside Drive and 89th Street. The exercises included the reviewing of a procession of veterans and the National Guard, of which Robert S. Heilferty was Grand Marshal, by Gen. Nelson A. Miles, with Mayor Low, Gen. Horace Porter, and Gen. O. O. Howard, followed by an address by Joseph A. Goulden, chairman of the Memorial Committee of the Grand Army of the Republic, who concluded by introducing Samuel F. Nixon, Acting Governor of New York, who then spoke. The keys of the monument were then handed to

Mayor Low, who after a brief address transferred them to President Willcox, of the Park Department, who accepted the trust in an appropriate address. The monument was then unveiled, and the exercises closed with an address by Gen. Howard. The memorial bears the inscription: "To the Memory of the Brave Soldiers and Sailors Who Saved the Union," and on the tablet is inscribed: "Soldiers' and Sailors' Memorial Monument of the City of New York. Commissioners: Robert A. Van Wyck, Mayor; George C. Clausen, President Park Board; John W. Goff, Recorder; Bird S. Coler, Comptroller; Joseph A. Goulden, Chairman Memorial Committee, Grand Army of the Republic. Architects, Charles W. Stoughton, Arthur A. Stoughton, Paul E. Dubry. Builders, Cullen & Dwyer."

On July 23 a bronze fountain that was presented to the Society for the Prevention of Cruelty to Animals by John M. Gitterman was unveiled at the intersection of Liberty Street and Maiden Lane.

On Nov. 16 a statue of Gen. Josiah Porter, designed by Clark G. Noble, was unveiled on the parade ground in Van Cortlandt Park. The veil was drawn by Mrs. Mary Porter Robinson, daughter of Gen. Porter.

In the autumn a committee from the New York Historical Society and the American Historic and Scenic Society, to cooperate with the Municipal Art Commission, was appointed to examine the memorial tablets in the borough. It is said that there are many errors on these tablets, and it will be the work of the committee to correct these, as well as to pass upon the design, inscription, and location of such other memorial tablets as the patriotic societies may seek to place.

Historical.—Under the auspices of the Scenic and Historic Preservation Society plans have been made for the preservation of Fraunce's Tavern. The building is to be restored, so far as the records make possible, to its condition at the time when Washington took leave of his generals in the old Long Room, and a park is to be established on the surrounding half-block of property, the purchase of which, with the building itself, was authorized by the Board of Estimate and Apportionment, for \$340,000. The Long Room will be a portrait-gallery of Washington's generals who met within its walls. Patriotic societies are expected to contribute simple collections of Revolutionary relics, which will be displayed in the other apartments. Revolutionary cannon, set up as if for action, will be planted amid the trees that will be set out, and custodians, to be uniformed as Continental soldiers, are to be placed in charge.

Surrogate's Court.—This branch of the judiciary is under the supervision of two surrogates, each of whom is elected for fourteen years and receives a salary of \$15,000. The incumbents during the year were Abner C. Thomas and F. T. Fitzgerald; and their office is in the County Court-House. In 1902, they report, 5,170 motions were heard and disposed of; 379 will contests were tried; 2,142 wills were offered for probate, of which 123 were foreign wills; 1,968 were admitted and 5 rejected; 1,910 letters testamentary were granted; 1,878 decrees admitting wills were drawn by the Probate Department; 3,401 accounts were filed; 2,024 decrees were made on final accountings; 23,799 orders and decrees were signed and entered; 3,528 letters of administration were granted and issued; 3,816 petitions in administration were examined and signed, and 55,800 bundles of papers handled for the exami-

nation of accounting, administration, probate, and real-estate proceedings.

Immigration.—The reception of immigrants in New York is under national supervision. The commissioner, who is appointed by the President, was Thomas Fitchie, who in April was succeeded by William Williams. Ellis Island, in New York Bay, is the landing-place for immigrants. In the year ending Dec. 31 551,645 aliens were landed at this port. The nearest approach to this was in 1882, when 476,086 foreigners were landed at Castle Garden, and 1892 comes next with 445,989, which would indicate that the tide of immigration reaches its height every ten years. In 1901 408,040 aliens passed through the Ellis Island Bureau, and 341,712 in the previous year. The percentage of deportations for mental or physical infirmity or for poverty was greater than for any previous year. The records showed that out of 36,600 arrivals in December, 900 were excluded, while for the same month in 1901 there were only 255 exclusions out of 29,685 arrivals. Of the total number landed in 1902, 5,533 were ordered deported, liability to become a public charge being the chief cause of exclusion. The increase in the number and percentage of deportations is due to the more rigid examination of immigrants. The work in connection with the strict inspection has been so severe that in one month 4 inspectors resigned. The holders of the money, baggage, and catering privileges who have been doing business on Ellis Island ten years were ousted for alleged irregularities, and were replaced by new men. The various steamship companies were forced to exercise a stricter supervision over the class of steerage passengers who come over in their vessels, and to be more careful in making out their manifests, as fines ranging from \$10 to \$1,000 were inflicted upon the companies guilty of careless or improper manifestation.

Harbor Improvement.—The care of the harbor improvement is under the control of the chief of engineers of the War Department. The report of the work done in the year shows that the improved channels by way of Sandy Hook have a full depth of 30 feet and are 1,000 feet wide, except in one or two places where the channel has shrunk to 800 feet in width. The work on the Ambrose channel continues with good success. Improvements have been made at Governor's Island, headquarters of the Department of the East, by building wharves and dredging, so that larger vessels may approach the island. The State of New York has conveyed to the United States some ground under water, and it is proposed to enlarge the island by constructing bulkheads upon this ground. It is estimated that the entire project will cost \$685,000, and that \$400,000 will be required immediately. The following estimates for 1903 were made: New York harbor, for general improvement, \$100,000; for Ambrose channel, \$340,000; to complete the project, \$2,720,000; Bay Ridge and Red Hook channels, \$348,000; to complete the project, \$1,898,000.

Events.—On Jan. 6 Prof. Nicholas Murray Butler was chosen President of Columbia University.

On Jan. 8 a serious collision occurred in the tunnel of the New York Central Railway in New York city, killing 17 persons and injuring a large number.

On Jan. 27 an explosion, caused by dynamite, occurred in the Rapid-Transit tunnel, at Park Avenue and 41st Street, killing and injuring many persons and destroying considerable property.

On Feb. 22 the Park Avenue Hotel was partly destroyed by fire, and 17 persons were killed by the disaster.

On July 1 John M. Burke transferred the sum of \$4,000,000 to a board of trustees, to be used for the betterment of men and women who are unable to support themselves by reason of sickness or misfortune.

On July 30 a procession of 50,000 orthodox Jews followed the remains of Rabbi Jacob Joseph from the synagogue to the grave, chanting the Promise of David, and while in the vicinity of Grand and Sheriff Streets were attacked by the employees of a factory, and in consequence a riot occurred that culminated in bloodshed.

On Aug. 3 a remarkable storm passed over the city, producing at noon a darkness of such intensity that artificial illumination became necessary for the ordinary transaction of business.

On Oct. 6 the corner-stone of a new custom-house, to occupy the space bounded by Whitehall, State, and Bridge Streets and Bowling Green, was laid by Secretary of the Treasury Shaw.

On Nov. 4 an explosion of fireworks occurred in Madison Square, resulting in the death of 15 persons and the injury of 100 others.

On Nov. 11 the New York Chamber of Commerce formally dedicated its new building at 65 Liberty Street.

On Dec. 29 the doors of the old Hall of Records were closed, and as soon as the new building can be completed this historic edifice, erected in the early days of George III as a prison, will be demolished.

On Dec. 30 the freedom of the city was conferred on Dr. Adolf Lorenz, the great Austrian surgeon, who in many instances remedied congenital dislocation of the hip.

NEW ZEALAND, an island colony of Great Britain in the Pacific Ocean. Under the Constitution of 1875 the Governor has power to convene, prorogue, and dissolve Parliament only by the advice of responsible ministers, but he can veto bills or withhold them for the consideration of the Imperial Government and can submit drafts of bills for the consideration of either house, and all proposals for the appropriation of money must come from him before Parliament can legally provide for public expenditure. The Parliament, or General Assembly, consists of a Legislative Council of 45 members, appointed since 1891 for seven years, instead of for life as formerly, and a House of Representatives containing formerly 74 members, increased to 80 in 1902, elected by all adult citizens of both sexes, qualified by a residence of one year in the colony and three months in the district. The Governor at the beginning of 1902 was the Earl of Ranfurly, appointed in 1897 and continued in office till August, 1904, a year's extension of his term. The ministry at the beginning of 1902 was composed as follows: Prime Minister, Colonial Treasurer, Minister of Labor, and Minister of Defense, R. J. Seddon; Colonial Secretary, Postmaster-General and Electric Telegraph Commissioner, Minister of Railroads, Minister of Industries and Commerce, and Minister of Public Health, Sir. Joseph G. Ward; Minister of Lands and Minister of Agriculture, T. Y. Duncan; Commissioner of Stamp-Duties and Native Minister, J. Carroll; Minister of Immigration and Minister of Education, W. C. Walker; Minister of Public Works and Minister of Marine, W. Hall-Jones; Minister of Justice and Minister of Mines, J. McGowan; Commissioner of Trade and Customs, C. H. Mills.

Area and Population.—The area of the North island is estimated at 44,468 square miles; of the Middle island, 58,525 square miles; of Stewart's island, 665 square miles; total, 104,471 square miles, including adjacent small islands. Cook and other islands of the Pacific were annexed to New Zealand by the proclamation of June 10, 1901. The total white population of the three islands constituting the colony by the census of March 31, 1901, was 772,719, consisting of 405,992 males and 366,727 females. The population of the North island was 390,571; of the Middle island, 381,661; of Stewart's island, 272; of Chatham Islands, 207; of Kermadec Islands, 8. Including 43,101 Maoris, the total population was 815,820. There were 2,857 Chinese, of whom 32 were females. Of the Maoris, including 3,123 half-castes, 23,100 were males and 20,001 females. The population of the seaport of Auckland in 1901 was 34,213 within the town limits, 67,226 including suburbs; of Wellington, the capital, 43,638, or 49,344 with suburbs; of Christchurch, 17,538, or 57,041 with suburbs; of Dunedin, 24,879, or 52,390 with suburbs; of Sydenham, 11,404. The number of marriages in 1900 was 5,860; of births, 19,546; of deaths, 7,200; excess of births, 12,346; immigration, 18,074; emigration, 16,243. The increase of population by immigration is 36,000 in ten years.

Finances.—The revenue from customs in the year ending March 31, 1901, was £2,180,862; from stamps, including postal and telegraph receipts, £903,935; from railroads, £1,720,641; from the land tax, £294,584; from the income tax, £173,809; total revenue, £5,582,502, not including £89,369 from sales and £180,834 from rent of lands. The acreage alienated up to March 31, 1900, was 23,382,972 acres; total area of the colony, 66,861,440 acres. The public debt charges for 1901 were £1,745,616; expenditure for railroads, £1,144,832; for education, £481,087; for posts and telegraphs, £416,364; for constabulary and defense, £347,448; total, £5,479,703, exclusive of expenditure from the Public Works fund, which from 1870 to 1901 amounted to £31,287,647. The regular land tax, from which improvements are exempt, was 1*d.* in the pound in 1901, yielding £220,000 from land and mortgages, and the graduated supplementary tax, rising from 3*d.* in the pound on estates valued at from £5,000 to £10,000 to 2*d.* on estates exceeding £210,000, yielded £72,000. The income tax is 2½ per cent. on incomes up to £1,000, and 1*s.* on all above that amount, with exemption of £300. Old-age pensions cost the Government £207,000 in 1902. The public debt on March 31, 1901, amounted to £48,557,751, with an annual charge of £1,671,552 for interest and £46,364 for sinking-fund. The local revenues in 1900 amounted to £714,151 from rates and £1,220,060 from other sources; local expenditure, £1,960,073; debts, £7,057,350.

The Government revenue for the year ending March 31, 1902, was £6,152,839; expenditure, £5,914,915. The gross debt, which was £49,591,245, including £1,033,494 in the sinking-fund, on March 31, 1901, was increased during the following twelve months to over £52,900,000. A new loan of £1,750,000 for public works was proposed in the budget for 1903, which estimated revenue at £6,083,500 and expenditure at £5,987,063. The Government was able to borrow at par in the colony and Australia on 4-per-cent. bonds running four years when the London money market would not make favorable terms.

Defense.—There is a permanent force of 213 artillerymen and of 86 torpedoists to man 4 torpedo-boats and 4 launches. The volunteer force num-

bers 17,000; the police, 584; the number liable to militia duty, 112,000, comprising all males from seventeen to forty years of age, and from forty to fifty-five years of age of the unmarried males. During the Boer war New Zealand sent 6,700 men with 6,820 horses to South Africa. The Government formed plans to enlist returned soldiers and others as a volunteer reserve and also 6,000 Maoris, to be trained by British officers.

Production and Commerce.—Of the total area of New Zealand the area tilled in 1900 was 11,081,912 acres of artificial meadow, 1,554,123 acres under farm crops, 49,394 acres of plantations, 25,777 acres of orchard, and 17,411 acres of garden. The area of Crown lands leased for pasture in 1901 was 26,982,486 acres. The live stock of the colony consisted of 266,245 horses, 1,256,680 cattle, 19,355,195 sheep, and 250,975 hogs. The mineral production in 1900 was 326,467 ounces of silver of the value of £38,879,373, 616 ounces of gold of the value of £1,439,602, 10,159 tons of kauri-gum of the value of £622,293, 1,093,990 tons of coal of the value of £546,995, and small quantities of manganese and antimony ores. In 1901 the gold mined was 445,559 ounces, valued at £1,753,738. The value of imports in 1900 was £10,646,096, consisting of £3,727,926 of merchandise free of duty, £6,479,400 paying duties varying from 5 to 40 per cent. ad valorem, and £438,770 of specie. The value of exports was £13,246,161, of which £13,055,249 represent products of the colony, including £1,439,602 of gold, and £190,912 reexports. The imports of textiles and clothing were £2,420,241 in 1900; iron and steel manufactures and machinery, £2,133,219; sugar, £451,522; tea, £199,934; spirits, wine, and beer, £287,676; tobacco and cigars, £198,861; coal, £120,406; sacks and bags, £141,810; fruit, £226,128; oils, £206,770; fancy goods, £128,339; paper and books, £407,410; other merchandise, £3,285,010. The exports of wool were £4,749,196 in value and 140,706,496 pounds in quantity; grain, flour, and pulse, £1,049,399; frozen meat £2,123,881 in value and £1,844,831 in quantity; kauri-gum, £622,293 in value and 10,159 tons in quantity; tallow, £368,473; hides, skins, and leather, £475,986; live animals, £39,675; dairy-produce, £969,731, representing 172,583 hundredweight of butter and 102,849 hundredweight of cheese; hams and bacon, £16,777; preserved meat, £94,524; grass-seed, £93,006; phosphorus, £332,182; other colonial produce, £680,524. Imports from the United States increased from about £200,000 in 1896 to more than £1,000,000 in 1901.

Factories in New Zealand have increased 80 per cent. in five years, the number of workers 28 per cent., and wages paid 62 per cent. The conciliation and arbitration act has been seven years in operation. Although a section of the employers has labored for its repeal and individual trade-unions have complained of some awards of the arbitration courts, the workers in general are content with the act save in minor particulars that they wish amended, and the bulk of the employers do not complain. The act has been copied by New South Wales and South Australia. An amendment made in 1901 enables parties to present their differences at once to the court of arbitration, consisting of a jurist and representatives of laborers and employers; still the conciliation boards settle many troubles, and twice as many agreements are voluntarily reached and recorded as binding contracts by consultation between unions and employers as there are cases settled by award of the arbitration court.

Since the passing of the act the value of improvements has been increased £7,500,000.

Navigation.—During 1900 there were entered at New Zealand ports 616 vessels, of 854,632 tons, of which 545, of 742,551 tons, carried cargoes, and cleared 613, of 825,275 tons, of which 580, of 786,454 tons, carried cargoes. The number of colonial vessels entered was 393, of 392,519 tons, and cleared 397, of 388,436 tons; British vessels entered numbered 156, of 392,394 tons, and cleared 149, of 368,241 tons; foreign vessels entered numbered 67, of 69,719 tons, and cleared 67, of 68,598 tons. The number of vessels registered in the colony was 521, of 98,753 tons, of which 299 were sailing vessels, of 42,128 tons, and 222 were steamers, of 56,625 tons.

Railroads, Posts, and Telegraphs.—There were 2,300 miles of Government railroads in operation on April 1, 1901, of which 1,383 miles were in the Middle island and 829 miles in the North island. The revenue of Government railroads for the year was £1,727,236; expenditure, £1,127,848, being 65.30 per cent. of receipts. There were 6,243,593 passengers and 3,461,331 tons of freight transported. The capital cost was £18,230,057. There is a private railroad, 84 miles long, on the west coast of the North island, which the Government was authorized by Parliament to acquire at a certain price. The English shareholders refused to sell at this figure, and the Government retaliated by cutting off connections. The post-office during 1900 forwarded 38,662,296 letters, 1,236,183 letter cards, 1,908,515 postal cards, 17,948,858 parcels and book packets, and 17,045,715 newspapers. There were 369,834 money-orders issued and 264,018 paid. The receipts for the year ending March 31, 1901, from posts and telegraphs were £503,836 and expenses £418,272.

The Government telegraph-lines on April 1, 1901, had a length of 7,249 miles, with 20,682 miles of wire. The number of telegrams during the year was 3,898,128, of which 3,534,444 were paid despatches. The revenue from telegraphs and telephones was £186,978.

Politics and Legislation.—A system of Maori councils for local self-government, authorized in 1901, has been organized. The Maori nation has been induced to hand over to the Government over 1,000,000 acres of its best lands for settlement by whites or individual Maoris. The Maori king, Mahuta, opposed this arrangement at first. The business presented by the Government in the session of the Assembly that began on July 1 included a referendum bill, which one house had already passed; a bill providing State fire-insurance; and a measure making provision for aged and retired railroad employees. The Government purchased coal-mines. A measure was considered for preventing combinations for raising improperly the prices of food. New estates were acquired under the land acts for division and resale to actual settlers. The general elections, held in November, resulted in the fifth successive victory of the Progressive party of Mr. Seddon. The Government party elected 45 members; the Opposition, 23; Independents, 4; Prohibitionists, 4. In local-option districts the voting was in several instances in favor of no licenses or the reduction of licenses. The Government majority was twice as great as in the general election of 1890 that put the Progressives in control.

NICARAGUA, a republic of Central America. The Congress is a single chamber of 40 members, elected for two years by universal adult male suffrage. The President is elected by direct popular suffrage for four years. Gen. José Santos

Zelaya was elected President of the republic for the term ending Jan. 30, 1902. The Cabinet at the beginning of 1902 was composed of the following members: Minister of the Interior, Justice, Police, and Ecclesiastical Affairs, Gen. Fernando Abaunza; Minister of War and Marine, A. Saenz; Minister of Foreign Affairs and Public Instruction, Dr. Fernando Sanchez; Minister of Finance and Public Credit, Col. Felix Pedro Zelaya; Minister of Public Works, Dr. Leopoldo Ramirez Mairena.

Area and Population.—The area of Nicaragua is estimated at 49,200 square miles; the population at 450,000 to 500,000, mostly Indians with an infusion of negro blood. The white population of Spanish stock is exceedingly small, but Americans and other whites have settled in the country in recent years to the number of about 1,200. Managua, the capital, has 30,000 inhabitants; Leon, 45,000; Granada, 25,000; Masaya, 20,000; Chinandega, 20,000.

Finances.—The revenue for the calendar year 1899 was \$4,475,827 in silver, and expenditure \$4,557,794. For 1900 the revenue was estimated at \$6,408,000, and expenditure at \$6,414,951; revenue for 1901 at \$5,760,920, and expenditure at \$5,758,923. In 1899 customs yielded \$2,187,700; liquor and tobacco duties, \$1,118,120; the tax on slaughtering cattle, \$214,069; railroads, steamboats, posts, and telegraphs, \$690,400. The expenditures were \$1,573,885 for the army and navy, \$941,014 for public works, \$656,237 for finance, \$398,382 for education, \$536,573 for police, \$315,936 for government, and \$119,640 for justice.

The foreign debt, consisting of a railroad loan raised in England at 6 per cent. in 1886, readjusted at 4 per cent. in 1895, amounted on July 1, 1901, to \$273,900. The internal debt on Jan. 1, 1900, amounted to \$8,064,935.

The Army and Navy.—All young men between the ages of eighteen and thirty-five can be called into military service, and for ten years longer they belong to the reserve, and then to the National Guard until they are sixty-five years old. The number in active service must not exceed 3,500; in 1900 it was about 2,000. The war strength approximates 25,000.

The naval force consists of 2 steamers on the Atlantic coast, 2 on the Pacific, and 4 on the Lake of Managua.

Commerce and Production.—Coffee, banana, cacao, and sugar cultivation are being extended by foreign settlers. The people have about 400,000 cattle and export live animals and hides. The export of coffee in 1900 was about 200,000 bags; of sugar, 12,238 hundredweight. Rubber must not be exported except from the state of Zelaya, the old Mosquito Territory. There are 109 gold and silver and copper mines belonging to American and English companies. The shipments in 1900 were 18,500 ounces of gold, besides 14,050 pounds of ore. The total value of imports in 1900 was estimated at \$8,441,880; and that of exports at \$9,406,436 in silver. The value of cotton goods imported was \$3,852,000; of woollens, \$234,000; of provisions, \$183,120; of flour, \$420,000; of wines and spirits, \$384,000; of hardware, \$219,600; of drugs, \$206,400; of sacks, \$123,000. Among the exports the value of coffee was \$4,800,000; of rubber, \$828,000; of mahogany and cedar, \$616,560; of dyewoods, \$215,280; of cattle, \$540,000; of hides, \$378,000; of gold bars, \$432,000; of gold-dust, \$312,000; of gold ore, \$968,280. Of the imports Great Britain supplied about 40 per cent., the United States 25 per cent., Germany 19 per cent., France 10 per cent., and other countries 6 per cent.; of the exports 30 per cent. went

to Great Britain, 29 per cent. to the United States, 28 per cent. to Germany, 5 per cent. to France, and 8 per cent. to other countries.

Navigation.—The number of vessels entered in 1900 at the port of Corinto, which has two-thirds of the commerce of the country, was 200 in the foreign trade, of 328,622 tons.

Railroads and Telegraphs.—There are 140 miles of railroads, which connect with steamers on Lake Managua and Lake Nicaragua. A line from Managua to Leon and Corinto, 38 miles long, was contracted for in October, 1900, to be completed in 1902, which will do away with steamboat transport between those points. Except 7 miles, all the railroads are Government property.

Political Affairs.—The Presidents of Costa Rica, Honduras, Nicaragua, and Salvador met at Corinto in January, 1902, to discuss matters of common interest to Central American states. The outcome of the conference was a treaty laying down a series of agreements in public law and an undertaking to establish a tribunal of arbitration which in the future will decide all differences that arise between any of the four states. The President of Guatemala was invited to take part in the conference. Pleading inability to attend, he sent his Minister of War to represent him, but without full powers. By a vote of the conference President Iglesias, of Costa Rica, was commissioned to seek the adhesion of President Estrada Cabrera, of Guatemala, to the treaty, and he departed on Jan. 25 for this purpose. Gen. Santos J. Zelaya was reelected President of Nicaragua for a third term and on Feb. 2 was inaugurated at Managua. He has continuously held the office since he was first proclaimed President in 1893 as the result of a revolution in which President Roberto Sacaza was overturned. Other politicians were now ambitious for the presidency, the Opposition chafed at exclusion from office for so long a period, and many acts of President Zelaya's long administration had given rise to popular discontent. The aid extended to the Colombian revolutionists from Nicaragua provoked a revolutionary movement against Zelaya's Government from Colombia as a base. Early in March, 1902, Government spies heard of correspondence from exiles in Panama which gave warning of an intended rising. The Government took the precaution to arrest immediately prominent members of the hostile party living in Granada, which is the Conservative stronghold. Those who did not escape arrest were taken to Managua and imprisoned. On July 7 a party of Nicaraguan revolutionists were landed near Bluefields from the Colombian gunboat Pinzon. The Government forces, acting promptly, defeated the revolutionists, and most of these surrendered. Their captors intended to shoot their prisoners, but desisted when the commander of the British gunboat *Psyche* landed and insisted that no one should be executed without a fair trial. The President sought a defensive alliance with Salvador against Colombia, fearing that the latter would retaliate with warlike measures for active assistance rendered by the Nicaraguan Government to the revolutionary Liberals of Colombia. In consequence of the impracticable conditions demanded by the Colombian Government and its dilatory proceedings in regard to the terms of a treaty to grant a right of way to the United States for the construction of the Panama Canal, Secretary Hay began informal negotiations with the Nicaraguan and Costa Rican governments with the object of concluding a tentative treaty for the construction

of a canal by the Nicaragua route in the event of failure to reach an agreement with Colombia. Those governments were anxious to have the Nicaragua Canal completed, and they offered terms more favorable to the United States than the Colombian Government considered itself competent to concede. The Nicaraguan Government was financially embarrassed before the military measures taken against revolution and a further decline in the value of the paper currency added to its difficulties. In November all customs duties were raised 160 per cent. on account of the depreciation of paper money.

NORTH CAROLINA. (See under UNITED STATES.)

NORTH DAKOTA. (See under UNITED STATES.)

NORTHWEST TERRITORIES OF CANADA. The area of the Northern Territories, including Keewatin, Assiniboia, Saskatchewan, Alberta, Athabasca, Mackenzie, and Ungava, is 2,330,840 square miles; population in 1901, 200,000; capital, Regina. The area of the district of Franklin, reaching up to the far north, is not accurately known.

Government and Politics.—The Territorial Government in 1902 was unchanged. It comprised F. W. G. Haultain, K. C., as Premier, Attorney-General, and Commissioner of Education; A. L. Sifton, Treasurer and Commissioner of Public Works; G. H. V. Bulyea, Commissioner of Agriculture and Territorial Secretary. William Eakin was Speaker of the Assembly during its last session before the general elections. D. H. McDonald acted as leader of the Opposition. The session of the Assembly was opened by Lieut.-Gov. A. E. Forget on March 20, with a speech from the throne, of which the following are the significant passages:

"The unprecedented crop of last season brought the transportation question into prominence, and demonstrated the necessity for improved and enlarged accommodation for shipping and carrying grain to eastern points after the close of lake navigation. Owing to the representation made to the Canadian Pacific authorities by my Government, through the Department of Agriculture, the evils of the grain blockade existing a few weeks ago have been considerably mitigated. As a result, the farmers are now in receipt of an increase in prices amounting to at least 10 per cent. over prices formerly obtaining.

"Owing to the great increase of population in the Territories, provision will have to be made for increased representation in the Legislature, and a measure dealing with that subject will be submitted to you."

The Assembly was prorogued on April 19, after discussing at great length the question of obtaining full provincial rights from the Dominion Government and passing measures of local importance. One of the chief measures of the session was that presented by Mr. Bulyea, on April 18, in the form of a request to the Dominion Government asking amendment of the elevator act, so that when there was an undue difference between the street and the track prices of grain, the commissioner may order that all cars placed at such station shall be located at any elevator of which the manager is prepared to pay the proper price. He believed there was a combine in this connection, and that large sums were being made out of the farmers by elevator companies unduly depressing prices.

On April 18, Mr. Bennett moved a vote of censure against the Government for compromising lawsuits entered against them by the Hudson Bay Company regarding certain local-improve-

ment taxes. Mr. Haultain declared that the settlement was much better than litigation extending up to the judicial conference in London, and was supported by 26 to 6 votes. On the same day Mr. R. S. Lake moved the following resolution, which was unanimously passed:

"That in the opinion of this House, as the Canadian Pacific Railroad has signally failed to meet the pressing necessities of the Northwest in the matter of the transportation of grain, and as the Dominion Government has postponed conferring upon the Northwest powers that would enable the Territories to take steps to improve this present condition of affairs, therefore it becomes the imperative duty of the Dominion Government to take immediately steps looking to the procuring of increased transportation facilities for the Territories, whether by additional trunk lines or otherwise."

On April 2, a convention of the Eastern Assiniboia Liberals was held at Indian Head, and a series of resolutions was passed urging action in connection with the elevator companies as to wheat storage; the grant of increased powers of self-government and control to the Territorial Legislature; the reduction of Dominion fees under the land titles act; certain amendments to the homestead regulations in the Dominion lands act; more attention on the part of the Dominion Government to the transportation question, especially in districts where farmers have to haul their produce 15 to 35 miles. A vigorous protest was also lodged against any increase in the Federal tariff, and a demand was made for reduced duties on agricultural implements and other manufactured products. At a gathering of Liberals in Calgary on Sept. 3 resolutions were passed embodying the following platform for the Territories: 1. Demand for better post-office service. 2. No return to a protective tariff, and no increase in customs. 3. Increased expenditure by the Dominion on roads and bridges. 4. Increased railway and transportation facilities. 5. Three members for Alberta. 6. Thanks to the Laurier Government for the ability, integrity, and efficiency of its administration, and particularly that of the Department of the Interior.

Finances.—The Treasurer's budget speech was delivered on April 15. He said there would be a decrease of \$3,000 in the civil-service vote; there was a slight increase in legislation of \$1,000, owing to placing the library on a different footing. In the item for the administration of justice there would be an increase, but it would not add to the public burdens, as it was brought about by paying clerks of courts salaries instead of fees. The vote for education was about the same as last year. There was an increase in the Agricultural Department, where the work was very much greater than in previous years. The grants to hospitals were an automatic increase in consequence of the ordinance of the past year. The last item, miscellaneous, showed a great increase, from \$5,000 to \$45,000. The reason of this was that there would be an election, and \$30,000 would be required for that. Then there was the contemplated trip of the Premier to the coronation ceremony in England. The amount asked for this in the estimates was \$5,000. The speaker then referred to the inadequate moneys supplied them by the Dominion Government. In 1898 the amount was \$282,000, and since then it had been increased by only \$75,000. That was a very small amount, compared with the growth of the country. In the old province the increase of population had been gradual, but in the Northwest a new nation had sprung into existence at once.

Provincial Autonomy.—This question of obtaining greater powers and larger revenues from the Dominion was the central subject of the year's discussion. The Assembly had passed resolutions in 1900; Messrs. Haultain and Ross had visited Ottawa the same year, and again in 1901; an elaborate statement of the whole case had been made by the Territorial Premier to Sir W. Laurier under date of Dec. 7, 1901; and a bill had been submitted to the Ottawa Government embodying the Territorial demands and requirements. The proposal was to form the four districts of Assiniboia, Saskatchewan, Alberta, and Athabasca into a province of the Dominion, under the terms of the British North America act, with 4 members of the Senate and 10 in the Commons; with the same local constitution, powers, and rights as the other provinces; with the control of its Crown lands; and with subsidies of \$50,000 for legislative purposes and \$200,000 at the rate of 80 cents a head of its population; and interest at 5 per cent. on all lands granted for settlement by the Dominion Government within the bounds of the new province. Under date of March 27, 1902, the Hon. Clifford Sifton, Minister of the Interior at Ottawa, wrote Mr. Haultain as follows: "It is the view of the Government that it will not be wise at the present time to pass legislation forming the Northwest Territories into a province or provinces. Some of the reasons leading to this view may be found in the fact that the increase in the population now taking place will, in a short time, alter the conditions to be dealt with very materially; and that there is a considerable divergence of opinion respecting the question whether there should be one province only or more than one province. Holding this view, therefore, it will not be necessary for me to discuss the details of the draft bill which you presented as embodying your views." In his reply, dated April 2, the Territorial Premier concluded a vigorous protest in the following terms: "We can not but regret that the Government has not been able to recognize the urgent necessity for the change that has been asked, and can only trust that, as you have denied us the opportunity of helping ourselves, you will be at least impressed with the necessity and the duty, which is now yours, of meeting the pressing necessities of these rapidly developing Territories. While we may, in your opinion, without inconvenience, mark time constitutionally, we can not do without the transportation facilities, the roads, the bridges, the schools, and the other improvements which our rapidly growing population imperatively requires, and at once. Whether we are made into a province or not, our financial necessities are just as real, and in conclusion I can only trust that when the question of an increase to our subsidy is receiving consideration more weight will be given to our representations in that respect than has been given to our requests for constitutional changes."

General Elections.—The Territorial Assembly was dissolved on April 25, nominations took place on May 10, and the elections on May 21. Messrs. A. E. de Rosenroll, A. B. Gillis, R. S. Lake, G. H. V. Bulyea, and A. D. McIntyre, all Government supporters, were elected without opposition. Fifteen Independents were nominated, and only 10 straight Opposition candidates. In Calgary J. J. Young, editor of the Calgary Herald, simply asked a free hand in the coming Legislature. He was elected by a good majority. The general result was the choice of 23 Government supporters, 4 Opposition candidates, and 5 Independents.

Public Works.—The report of this department in the Territorial Government revealed a heavy

amount of work during the year, and a considerable development in the country. The sum of \$258,000 was voted for public works needed in 1901. At the close of the year \$236,574 was spent, and the outstanding contracts and works provided for, but not yet paid, would eat up the remainder. The amount expended in public works for 1902 was more than \$60,000 in excess of the year before. Mr. A. L. Sifton pointed out that this increased sum did not keep pace with the increased necessities of the department, and of the works required only the most pressing were performed. Had all the works been undertaken that were actually necessary, an expenditure of \$350,000 would have been required.

In the Territories there were 32 coal-mines in operation, and by the returns filed the output was shown to be 331,907 tons of bituminous coal and 14,742 tons of anthracite, or a total output of 346,649 tons. This was an increase of 25,370 tons over the previous year.

During the year \$8,300 was collected as departmental revenue. This was almost the only branch of the department that showed a decrease, which was owing to the fact that in the 1900 revenue was included a refund of \$10,000 made by the Dominion Government for amounts expended in improving the Peace river road, and a \$2,000 refund of expenditure on the bridge over Belly river at Standoff. The expenditure for the administration of the department was \$12,571. In the survey branch there were 9 employees. Instructions for 230 surveys were issued, 187 of which were completed before the season was over. In the year 750 cases for right of way of roads were settled. The usual schedule of road surveys made during the year was appended to the report. The department now owned 1,300 bridges, and \$33,082 was spent last year in repairing them. Wooden structures, as they are worn out, were being replaced by steel ones. In all, 113 were built last year, at a cost of \$69,296.

In irrigation work the report gave the following particulars: Number of canals and ditches constructed, 169; length of constructed canals and ditches, 469 miles; number of water-rights recorded for canals and ditches not yet completed, 14; number of acres susceptible for irrigation from constructed canals and ditches, 614,684; number of water-rights recorded for domestic power and other purposes, 127.

Immigration.—The year 1902 will be remarkable in the Territories as well as in Manitoba for the beginning of a wave of emigration from the United States. Slow settlement had been going on for years in different regions of the country, but now it had become a rush. In the southeastern section nearly all the new arrivals were described as brought from Iowa and Minnesota. The Canadian-American Land Company acquired 125,000 acres of Canadian Pacific Railroad lands, and strenuously endeavored to sell their holdings. Another aid to settlement was a combination of Iowa bankers, who purchased 40,000 acres for the same purpose. Conservative estimates placed the total increase at 50,000 persons in the south, at Edmonton and Calgary, around Lethbridge and Wetaskiwan, and among the Mormons of Cardston. Speaking of his first trip in three years through this country, Sir W. C. Van Horne made the following statement in Montreal on Sept. 30, 1902: "The homestead lands immediately along the railway-tracks have been taken up, but you must remember that the territory is enormous, and that when all the homestead lands are taken up the population will be numbered by millions and the railway mileage will be increased tenfold."

In Manitoba, I suppose, practically all the homestead lands have been taken up, and practically all the railroad lands have been sold. This is also largely true of Eastern Assiniboia, but as you go farther west the unoccupied areas increase."

Agriculture.—The work of the farmer and rancher and dairyman was the central source of Territorial progress in 1901-'02. The product of the creameries in the former year showed an average price of 19.25 cents a pound, with 1,345 patrons, for 672,393 pounds of butter. The secretary of the Western Stock-Growers' Association made figures public in April, 1902, which showed a shipment from Alberta of 45,301 head of live stock in the previous year, compared with 46,231 in 1900 and 27,578 in 1899. The grain production of the Territories in 1901 was as follows: Wheat, 12,676,343 bushels thrashed, 24.92 bushels an acre; oats, 11,113,066 bushels thrashed, 48.43 bushels an acre; barley, 736,749 bushels thrashed, 36.75 bushels an acre.

According to Crop Bulletin No. 2, issued on Sept. 1, 1902, by the Department of Agriculture at Regina, the estimated production for the year was 14,649,500 bushels of wheat, 10,725,500 bushels of oats, and 844,000 bushels of barley. At the annual meeting of the Territorial Horse-Breeders' Association at Calgary on May 16 the secretary estimated the number of horses in the Territories at 90,000 for Alberta, 45,000 for Assiniboia, and 15,000 for Saskatchewan. In 1901, 1,267 horses were imported via Calgary from the United States at an average price of \$32.89, and 2,806 via Lethbridge at \$21.71.

NOVA SCOTIA, an Atlantic province of the Dominion of Canada; area, 20,600 square miles. Population, in 1901, 459,574. Capital, Halifax.

Government and Politics.—There were no changes in the composition of the provincial Government in 1902. G. H. Murray was Premier and Provincial Secretary; J. W. Longley, Attorney-General; Arthur Drysdale, Commissioner of Works and Mines; and the members without office were T. Johnson, A. H. Comeau, A. MacGillivray, T. R. Black, W. T. Pipes, Hon. D. McPherson. On Feb. 13 the first session of the thirty-third Assembly of the province was opened by Lieutenant-Governor A. G. Jones, with a speech from the throne, of which the following are the significant passages:

"For some years past evidences of steady progress have been manifest in the agricultural, mining, fishing, and lumbering enterprises of the province, and the reports of the banking and other commercial institutions of the country offer conclusive evidence of marked and notable advance during the past few years. The output of coal in Nova Scotia for the past year was considerably the largest of any in our history, and the indications are for a substantial increase during the present year. The railway between Windsor and Truro, commonly known as the Midland Railway, has during the past year been completed and open for public traffic, as also the Inverness and Richmond Railway, between the Strait of Canso and Broad Cove Mines. Both of these railways open up important sections of country. Active work has been begun upon the railway between the Strait of Canso and St. Peters, which has been subsidized by my Government. During the last session of the Legislature a measure was adopted authorizing my Government to enter into a contract for the construction of a railway from Halifax to Yarmouth. After the Legislature had been prorogued, my Government immediately had negotiations with various parties for

the carrying out of the provisions of the act, and I may state that my Government ultimately entered into a contract with the Halifax and South Western Railway Company, to whom a charter was granted, under the provisions of the law, by order in Council, for the construction of a line of railway from Halifax to Barrington. The terms of such contract were somewhat in excess of the powers embodied in the act relating thereto, and such contract was made subject to ratification by the Legislature. A copy of this contract will be laid before you, and an act will be submitted for the ratification thereof.

"Since the recess steps have been taken toward the establishment of a public sanatorium for the treatment of tubercular diseases, and upon the report of the Medical Commission appointed for such purpose a site has been selected and secured."

Thomas Roberston was elected Speaker of the Assembly, and Robert Boak was maintained in his office of president of the Legislative Council, which he had held since 1878. When the coronation honors were announced it was found that he had been knighted in recognition of his long retention of an important office. In the session that closed on March 27, 213 acts were passed, of which the following were the more important:

To secure the registration of municipal debentures.

Respecting the maintenance and reform of juvenile offenders.

Respecting the encouragement of building of railways.

To amend chapter lii, Revised Statutes, 1900, the education act.

To amend chapter xviii of the Revised Statutes, 1900, the coal-mines regulation act.

To amend chapter clxxi, Revised Statutes, 1900, the mechanics' lien act.

To amend chapter clii, Revised Statutes, 1900, of investment of trust funds in certain loan companies.

To amend subsection 2 of section 10 of chapter clxx, Revised Statutes, 1900, of the sale of land under execution.

To amend chapter cxlv, Revised Statutes, 1900, the assignments act.

Of the mass of legislation involved, a large portion was private bills. Others were merely amendments to existing laws. A good deal of discussion took place about the proposed Maritime School of Agriculture, but nothing definite was done, and the principal enactment of the Legislature was the ratification of a contract regarding the South Shore Railway. Such by-elections as occurred during the year went in favor of the Government, which had only two members in opposition until December, when two Independents were elected.

Finances.—The financial statement was presented to the House on March 19 by Mr. Longley. The estimates for the year ending Sept. 30, 1902, included an expenditure of \$1,047,920 and a revenue of \$1,052,106, against the estimate for the preceding year of \$1,026,965 for expenses and a revenue of \$1,034,096. The expected revenue included \$460,000 from mines, \$30,000 from Crown lands, \$50,000 from the Nova Scotia Hospital, \$35,000 from succession duties, and \$432,000 from Dominion subsidies. The estimated expenditures included \$33,000 upon agriculture, \$260,000 upon education, \$20,000 upon Crown lands, \$50,000 for legislative expenses, \$43,200 for Public Works (which included \$22,000 upon the welcome to the Prince and Princess of Wales in 1901), \$134,850

upon public printing, \$52,219 upon steamboats, ferries, and packets, \$20,000 for salaries, \$109,690 on roads and bridges, \$21,000 for the provincial engineer's office, \$148,194 upon debenture interest, \$11,500 for election expenses, and \$32,000 for miscellaneous purposes. The actual total receipts from all sources for the year ending Sept. 30, 1901, were \$1,843,995. The expenditures were \$1,781,336.

The assets of the province on Sept. 30, 1901, were stated at \$1,368,654, of which \$1,056,128 was a Dominion of Canada provincial indebtedness from before confederation. The liabilities included \$2,043,500 of provincial debentures payable in Halifax, and \$1,727,666 payable in London.

Education.—According to the report of the Superintendent of Education, Dr. A. H. McKay, there were 1,848 school sections in the province compared with 1,875 in 1900; and 145 sections without schools, against 132. The schools in operation had decreased from 2,417 in 1900 to 2,387 in 1901; the number of teachers from 2,557 to 2,492; the number of male teachers had decreased from 616 to 540, while the number of female teachers had increased from 1,941 to 1,952. The total days' attendance in the year was respectively 11,318,771 and 10,763,651. Of the pupils in 1901 there were 91,114 in the common schools and 7,296 in the high schools. The provincial aid to the schools increased from \$248,309 to \$254,778, while the municipal funds for that purpose decreased from \$119,923 to \$119,876, and section assessments from \$519,020 to \$470,108. The total annual enrolment of pupils decreased in the same period from 100,129 to 98,410, and the daily average attendance from 56,224 to 53,643. On March 25 a Committee on Education reported to the Legislature:

"Your committee are inclined to the opinion that the schools of this province, as at present conducted, are too much absorbed in book work and in verbal studies, which seek to train the memory only, but which fail to give adequate discipline or to fit the pupil for skilled labor or practical life. Your committee do not wish to be understood as reflecting in the least on the men in charge of our educational system. The defects in the system are a legacy that has been handed down to them from the past, and will take time and patience to remove, and we feel certain that the Superintendent of Education and the teachers throughout the province will be glad to embrace any opportunity that may be offered to effect the necessary reform. It will not be denied that our schools should, as far as possible, prepare the pupils for an intelligent apprenticeship in the calling that is to yield them a livelihood. The child's education should cultivate a taste in him for his future work. The apparent inability on the part of the pupils to turn the results of the work done in the schools to practical every-day use is the defect that in many quarters is charged against the existing system."

Mines.—The mineral production for the year ending Sept. 30, 1901, included 419,567 tons of iron ore, compared with 15,507 in the previous year; 3,025,365 tons of coal raised, against 3,238,245 tons; 120,000 tons of coke made, compared with 62,000 tons; 135,637 tons of gypsum, against 122,281 tons. Grindstones decreased in production 50,000 tons to 315 tons. Limestone increased from 50,000 tons to 95,794 tons. And pig-iron rose from nothing to 90,034 tons. The revenue of the Mines Department for the year ending Sept. 30, 1901, was \$437,726, which included royalties on coal of \$367,925, and lesser sums for other royalties, leases, rentals, licenses, and fees. The sum

of \$2,630 was paid to the Dominion Iron and Steel Company as an allowance of 6½ cents on each ton of coal consumed in the local manufacture of iron and steel up to Aug. 16, 1901. The United States took 624,273 tons of Nova Scotia coal in 1900, and 590,086 tons in 1901.

A dispute that arose between the Dominion Coal Company of Sydney and its employees as to the rate of wages was decided, under the terms of the miners' arbitration act, by a Board of Arbitrators. The decision was against any present increase.

On Feb. 26, 1902, the Nova Scotia Mining Society met in Halifax, with President W. L. Libbey in the chair. In his opening address Mr. Libbey reported great increase in the facilities of local coal-mines; substantial progress in obtaining the confidence of capitalists in provincial resources and transportation arrangements; marked progress in systematic and legitimate development work below ground; a fairly plentiful supply of labor in the coal districts and gold areas; an inadequate supply of technically educated mining men. A report was then presented from the committee which had been appointed to urge upon the Government suggestions regarding the following subjects: 1. A Government assay office. 2. Technical education. 3. Encouragement to deep mining. 4. An improved departmental report. 5. To revive the legislation of 1885 requiring a record of plans of the workings of all metalliferous mines. 6. That in future appointments to the office of deputy inspector shall be subject to a technical examination. 7. That the present inaccurate maps of the Mines Office be rectified. 8. That all rentals be made payable on two fixed days in the year.

Transportation.—The new railways opened in 1901 included the Inverness and Richmond, 61 miles, from Port Hastings to a junction with the Intercolonial Railways at Point Tupper, and the Midland Railway, 57½ miles, from Windsor to Truro. The Cape Breton Railway Extension from Point Tupper to St. Peters, and thence to Louisburg, was under construction, and several projected lines were under survey. All were connected with the mineral development of the province. The traffic of the railways under provincial control in the year ending Sept. 30, 1901, included the carriage of 206,018 passengers, with receipts amounting to \$857,747; the carriage of freight and live stock, with returns of \$594,868; and the carriage of mails and sundries, with returns of \$153,180—a total of \$836,187, compared with \$654,828 in 1900.

The most important piece of legislation in 1902 was that relating to the South Shore Railway—the granting of sufficient Government assistance to insure the building of a line between Halifax and Yarmouth. The Opposition declared that in the contract made in this connection the public interests were not sufficiently protected.

The Government side of the agreement with Messrs. Mackenzie and Mann was explained and defended by Mr. Longley in the Assembly on March 13. In the course of his speech he said: "Under the arrangement proposed, the Government were to advance \$13,500 a mile, upon which the company were to pay interest, with a proviso that if the interest were not paid after three years the Government should have the right to take possession of the road. In that case, the Government would have obtained possession of the road at a cost of \$13,500 a mile, whereas if it were constructed as a governmental work no one believed that it could be constructed for less than \$20,000 a mile. Certainly this was \$6,500

a mile better for the construction of the road through this whole section of country than if it were undertaken as a Government work. Of course, he was assuming that the road was going to pay; but if it did not pay, the Government would be in a better position to that extent than if they built it themselves, because they would be getting the road on the most favorable terms for the smaller sum per mile. He might add, that the contract would never have been entered into if the Government had any doubt that the earnings of the road would pay the trifling and moderate sum of \$350 per mile, which was all that the obligations of the Government involved."

On March 26, 1902, a report of a special committee of the House was presented by E. M. Macdonald. It said, among other things: "The establishment of bait-freezers has helped to develop the fishing industry, and in order that the people of central Canada and the central United States may be reached with our fish products we require certain advance steps to be taken. From the facts before us we are of the opinion that the following improvements are required: First, the establishment of refrigerators at the different railway terminals, to which fish could be sent for shipment at all times. Second, the adoption of improved cold-storage cars, and better attention paid to icing cars in transit. Third, Government assistance for experimental car lots of fresh fish to be sent directly to Chicago or other Western points, under the supervision of an expert. Fourth, the establishment of a large freezer at different points to provide bait."

Agriculture.—The agricultural societies in Nova Scotia numbered 151 in 1901, with 8,500 members, having subscriptions of \$10,771 and a

Government grant of \$10,000. Special attention was paid during the year to dairying, and reports of operations published on April 5, 1902, showed a production of 316,180 pounds of cheese worth \$30,087, and 542,626 pounds of butter, valued at \$53,222. In his annual report, the provincial Secretary of Agriculture said that the farmers were giving more attention to the raising of horses, and that the outlook for cattle, sheep, and swine was most satisfactory.

Crown Lands.—The receipts from this source of revenue in the year ending Sept. 30, 1900, were \$45,581—the largest since 1872. The estimated returns for 1901 were \$35,000; the actual receipts were \$91,548. In his annual report, dated Oct. 1, 1901, Mr. Longley made the following statements: "The result of the new policy of issuing leases instead of grants has appeared to increase the demand for land on the one hand, and at the same time it has made it easy to issue leases for large areas. The result of these leases is not to tie up the lands for any private parties permanently, but only for a term of twenty, or possibly forty years, and care is taken that when large areas are leased it shall be in the furtherance of some lumber industry which is calculated to advance the industrial life of the province. The very large leases applied for last year and this year are in connection with the development of the pulp industry in Nova Scotia. Two or three years ago a large lease was issued in the counties of Inverness and Victoria to a company who have undertaken to erect large pulp-mills and create a great industry in that section. The applications for large areas made during the fiscal year just closed are chiefly for lands in western Nova Scotia, with a view to the further development of the same industry."

OBITUARIES, AMERICAN. Adams, Charles Kendall, educator and historian, born in Derby, Vt., Jan. 24, 1835; died in Redlands, Cal., July 26, 1902. He was graduated at the University of Michigan in 1861, and studied in Germany, France, and Italy. He became Assistant Professor of History in the University of Michigan in 1863, and in 1867 was made full Professor, holding the chair until 1885. From 1881 to 1885 he was non-resident Professor of History in Cornell University, and in 1885 he succeeded Andrew D. White as its president. He resigned in May, 1892, and two months later accepted the presidency of the University of Wisconsin, serving till his resignation in October, 1901. He was president of the American Historical Association in 1890. He was the author of *Democracy and Monarchy in France* (1874); *Manual of Historical Literature* (1882); *British Orations* (1884); and *Christopher Columbus*. He was editor-in-chief of *Johnson's Universal Cyclopedia* (1892-'95).

Agnew, Daniel, jurist, born in Trenton, N. J., Jan. 5, 1809; died in Beaver, Pa., March 9, 1902. He was graduated at the Western University of Pennsylvania, and was admitted to the bar in 1829. He practised in Pittsburg, and subsequently in Beaver, where he rapidly achieved a high reputation as a real-estate lawyer. In 1833 he joined the Whig party, and through his gift of oratory soon became a leader. He was a member of the Constitutional Convention in 1837-'38, and aided in framing a series of amendments to the Constitution of 1790, which subsequently became a part of it. In June, 1851, he was appointed

president judge of the 17th Judicial District of Pennsylvania, and in October following he was elected for a term of ten years. He was reelected without opposition in 1861, and in 1863 was elected to the Supreme Court of Pennsylvania, where he served as Associate Justice till 1874, when he became Chief Justice, and continued in that office till the expiration of his term in 1879.

Anderson, John F., military officer, born in Wiscasset, Me., about 1834; died in Portland, Me., April 19, 1902. He removed to Boston in early life. When the civil war broke out he was commissioned major of the 24th Massachusetts Regiment, and later he was promoted brigadier-general of volunteers. After the war he was in business in Boston for many years.

Andrews, Charles Bartlett, jurist, born in Sunderland, Mass., Nov. 4, 1834; died in Litchfield, Conn., Sept. 12, 1902. He was graduated at Amherst College in 1858; studied law and was admitted to the bar in Litchfield, where he afterward practised. He was elected to the State Senate in 1868 and 1869, and to the House of Representatives in 1889; was Governor of the State in 1879-'81; judge of the Superior Court in 1882-'89; and chief justice of the Supreme Court from 1889 till his retirement, Oct. 1, 1901.

Andrews, George Pierce, jurist, born in North Bridgeton, Me., Sept. 29, 1835; died in New York city, May 24, 1902. He was graduated at Yale University in 1858; was admitted to the bar in 1861; and soon afterward was appointed Assistant United States District Attorney, which office he held six years. From 1872 till 1884 he

was assistant and corporation counsel of New York city, and from 1884 till 1901 was an Associate Justice of the Supreme Court. His opinions, especially in tax cases, were considered of great value.

Ayres, Alfred. See OSMUN, THOMAS EMBLEY.

Babcock, Nathan, manufacturer, born in Westerly, R. I., Nov. 19, 1824; died in Pawcatuck, Conn., May 31, 1902. When eighteen years of age he was apprenticed to a machinist, and afterward he applied himself to mechanical pursuits. In 1855 he entered into partnership with the late C. B. Cottrell, under the firm name of Cottrell & Babcock, for the manufacture of cotton and woolen machinery, and in a few years the firm began building power printing-presses. In 1880 he retired from the firm, and two years later he organized the Babcock Printing-Press Manufacturing Company, of which he was secretary and treasurer from the time of its organization till his death.

Baldwin, Stephen Livingston, missionary, born in Somerville, N. J., in 1835; died in Brooklyn, N. Y., July 28, 1902. He became a missionary when a young man and labored in China under the auspices of the Methodist Episcopal Church for twenty years, during which time he translated a large part of the Bible into Chinese. He is also said to have printed the first copy of the Bible in that language. After his return to the United States he held pastorates in the Methodist Episcopal Church, and was conspicuous in the organization of the Ecumenical Missionary Conference in New York in 1900.

Bangs, Mark, jurist, born in Massachusetts about 1822; died in Chicago, Ill., June 23, 1902. He removed to Chicago in 1844, and for a time was engaged in farming. Later he studied law in Lacon, Ill., became a partner of his preceptor under the name of Fenn & Bangs, and on the death of Judge Fenn associated himself with F. W. Shaw. Mr. Bangs practised in association with Mr. Shaw till the organization of a new judicial district, when the former was chosen its first judge, and at the end of his term returned to private practise. In 1870 he was elected to the State Senate. In December, 1875, he was appointed United States District Attorney, and during his incumbency of this office he was active in prosecuting the famous Whisky Ring and other transgressors of the revenue laws. Judge Bangs was foremost among the temperance and total-abstinence reformers; was one of the organizers of the Republican party in the State of Illinois; and in 1862 with four others established the Union League of America.

Barnwell, Robert Woodward, clergyman, born at Beaufort, S. C., Dec. 27, 1849; died at Selma, Ala., July 24, 1902. He was a graduate of Trinity College, Hartford, Conn., and studied for the Episcopal ministry at the General Theological Seminary, New York city. He took orders, and, after some months devoted to missionary work in Georgia, was rector of Trinity Church, Demopolis, Ala., in 1876-'80, and of St. Paul's, Selma, in 1880-1900. He declined a nomination to the bishop coadjutorship of Alabama in 1890, but on the death of Bishop Wilmer, in 1900, he accepted the office of Bishop of Alabama and was consecrated in July. Bishop Barnwell possessed great charm of manner, and in his administration of affairs exhibited rare tact and skill.

Barrows, John Henry, educator, born in Medina, Mich., July 11, 1847; died in Oberlin, Ohio, June 3, 1902. He was a son of the late Prof. John M. Barrows; was graduated at Olivet Col-

lege in 1867, and later at Yale, Union, and Andover Theological Seminaries; and for nearly three years was engaged in missionary and educational work in Kansas. After a pastorate with the First Congrega-

tional Church in Springfield, Ill., he spent a year in travel in Europe and the Holy Land. On his return to the United States he became pastor of the Eliot Congregational Church, Lawrence, Mass., where he remained for five years. He removed to Chicago in 1881, to take charge of the First Presbyterian Church, and remained there more

than fourteen years. The semicentennial celebration of the founding of the Presbyterian Church occurred in 1883, and this led him to publish a history of that Church, under the title of *Ecclesiastical Antiquities*. He took part in all missionary and reformatory enterprises in Chicago; became a favorite speaker at college commencements, on the lecture platform, at temperance, missionary, and Christian Endeavor conventions, at soldiers' meetings, and before the great gatherings at Chautauqua, N. Y. In 1893 he was president of the World's Parliament of Religions. In 1894 he accepted the lectureship of Comparative Religion in the University of Chicago, and in 1896 resigned his pastorates in order to deliver in India a series of lectures on a foundation endowed by Mrs. Caroline E. Haskell in connection with the University of Chicago. On his return to the United States in May, 1897, he delivered numerous lectures, including the Morse course at the Union Theological Seminary on *The Christian Conquest of Asia*. In November, 1898, he accepted the presidency of Oberlin College, which he held until his death. He was the author of *I Believe in God*; *Life of Henry Ward Beecher*; *The World's Parliament of Religions*; *A World-Pilgrimage*; *Christianity, the World Religion*; and *The Gospels are True History*.

Beach, Miles, jurist, born in Saratoga County, New York, in 1840; died in New York city, May 18, 1902. He was graduated at Union College in 1854, studied at Albany Law School, and soon after his admission to the bar became associated with his father in the law firm of Beach & Smith. He entered political life when a young man, and subsequently became mayor of Troy. In 1867 he removed to New York and organized the firm of Beach, Daly & Brown, later Beach & Brown. He was elected to the Court of Common Pleas in 1879, and on the expiration of his term in 1894 was elected a justice of the Supreme Court of the State.

Beardshear, William Miller, educator, born in Dayton, Ohio, Nov. 7, 1850; died in Des Moines, Iowa, Aug. 5, 1902. He was brought up on a farm, and at the age of fourteen entered the National army. After the war he studied at Otterbein University, Ohio, and later at Yale. In 1881 he was chosen president of Western College, Toledo, Iowa, where he served till 1889, when he became superintendent of the public

schools of Des Moines. Two years later he was made president of the Iowa State College of Agriculture and Mechanic Arts, which post he held until his death. In 1894 Dr. Beardshear was made president of the Iowa State Teachers' Association, and in 1897 was appointed one of the United States Indian Commissioners.

Behman, Louis C., theatrical manager, born in Brooklyn, N. Y., June 4, 1855; died there, Feb. 27, 1902. He was brought up with the view of becoming his father's assistant in the grocery business, but as he grew to young manhood his ideas of making a fortune developed along different lines. While still a mere youth he gave summer-night concerts in the old Clermont Avenue Skating-Rink, and with the money he made there he went to Philadelphia in 1876, while the Centennial Exposition was in that city, and, with a friend, Richard Hyde, another Brooklyn youth, he leased a theater and made considerable money. They returned to Brooklyn, and leased a building in Adams Street that had formerly been the Brooklyn Market. This the young managers soon turned into a theater, and they gave their first performance in it May 19, 1877. The character of the entertainment was similar to that presented at the German Volksgartens, but the venture prospered, and when the building was destroyed by fire, in 1890, Mr. Behman purchased more adjacent land and erected a new and handsome theater. The partnership was dissolved in 1899, and the Hyde and Behman Amusement Company was incorporated. They acquired the ownership of the Star, Novelty, and Amphion Theaters, in Brooklyn, and owned controlling interests in the Herald Square Theater, in Manhattan, and the Newark, Bijou, and Folly Theaters, in Newark, N. J. They also sent many companies of vaudeville performers on the road. When Mr. Behman died he was considered one of the wealthiest managers in the United States.

Bierstadt, Albert, artist, born near Düsseldorf, Germany, Jan. 7, 1830; died in New York city, Feb. 18, 1902. He was brought to the United States in infancy, his family settling in New Bedford, Mass., where he spent his youth. He studied painting in Düsseldorf, Germany, under Lessing, four years, and later in Rome, returning to the United States in 1858, and introducing what is known as the Düsseldorfian manner of landscape. He visited the West and the Rocky Mountains, where he obtained material for many of his most noted pictures; and in subsequent visits to Europe he collected material for Alpine and Italian subjects, the best known of which is his Storm on the Matterhorn. He was elected a member of the National Academy of Design in 1860; was awarded many foreign medals; was decorated with the Cross of the Legion of Honor in 1867, with two degrees of the order of St. Stanislaus in 1869 and 1872, and with the Imperial Order of the Medjidii in 1886. His paintings of American scenery include Laramie Peak (1861); Lander's Peak in the Rocky Mountains (1863); North Fork of the Platte (1864); Looking down the Yosemite (1865); El Capitan; On Merced River (1866); Valley of the Yosemite (1866); Settlement of California; Discovery of the Hudson River; Emerald Pool on Mount Whitney (1870); Great Trees of California (1874); Valley of Kern River, California (1875); Mount Whitney, Sierra Nevada (1877); Estes Park, Colorado; Mountain Lake, Sierra Nevada (1878); Mount Corcoran, Sierra Nevada (1878); Geysers (1883); View on Kern River (1884); On the Saco, New Hampshire (1886); and California Oaks (1886).

Bigelow, Marshall Train, printer and proof-reader, born in South Natick, Mass., Oct. 5, 1822; died in Cambridge, Mass., Dec. 23, 1902. He became connected with the University Press in Cambridge in 1843, and was for many years a member of the firm, the firm name from 1859 to 1879 being Welch, Bigelow & Co. He was long ranked as one of the most competent proof-readers in the country, but had retired from active life for several years. He published Punctuation and Other Typographic Matters (1881), and Mistakes in Writing English and How to Avoid Them (1886).

Bloodgood, Delavan, surgeon, born in Springfield, N. Y., Aug. 20, 1831; died in Brooklyn, N. Y., April 4, 1902. He was graduated at Madison University, Hamilton, N. Y., in 1852, and later at Jefferson Medical College, Philadelphia. He entered the United States navy with the rank of assistant surgeon in 1857, and in the civil war served on the Mohawk and the Dacotah, which took part in several important operations. After the war he served on foreign stations, and for several years was fleet surgeon of the Pacific squadron. In 1886-'87 he had charge of the Naval Hospital at the Norfolk Navy-Yard, and later of the naval laboratory at the Brooklyn Navy-Yard, holding the latter assignment at the time of his retirement, Aug. 20, 1893. When the Spanish-American War broke out, in 1898, Surgeon Bloodgood was assigned to special duty at the naval hospital in Brooklyn.

Bouton, John Bell, author, born in Concord, N. H., March 15, 1830; died in Cambridge, Mass., Nov. 18, 1902. He was graduated at Dartmouth College in 1849 and studied law, but did not practise. His life work was that of journalism and literature. He was editor of the Cleveland, Ohio, Plain-Dealer in 1851-'55; removed to New York city in 1857 and became connected with the Journal of Commerce, with which paper he remained till 1889, when he retired from journalism. He was a contributor to Appleton's Annual Cyclopædia for ten years. His published books include Loved and Lost, a series of essays (1857); Round the Block (1864); Treasury of Travel and Adventure; Round about Moscow (1887); Uncle Sam's Church (1895); and Memoirs of General Bell (1902).

Boynnton, James Stoddard, jurist, born in Henry County, Georgia, May 7, 1833; died in Griffin, Ga., Dec. 22, 1902. He was elected ordinary of Butts County, Georgia, in 1860; served in the Confederate army during the civil war, rising from private to colonel; was judge of the Spalding County Court in 1866-'68; mayor of Griffin in 1869-'72; president of the State Senate in 1880-'82; and became Governor of Georgia in 1883. In 1886-'93 he was judge of the Flint Circuit Court, resigning in the latter year to become division counsel of the Central of Georgia Railway.

Brantley, John Joyner, clergyman, born in Augusta, Ga., Dec. 29, 1821; died in Macon, Ga., June 8, 1902. He became connected with the Baptist Church in Milledgeville in 1839, and was licensed to preach in the First Church of Charleston, S. C., of which his father was pastor, in 1844. He held pastorates in Fayetteville, N. C., five years, and in Newbury, S. C., seventeen years; taught for several years in Richmond Academy, Augusta, Ga.; was principal of the Male Academy in Pillsboro, N. C.; and was Professor of Languages in Mercer University from 1867 till his death. Dr. Brantley was one of the most accomplished linguists in the South.

Bridges, Eloise (Mrs. Charles H. Erwin), actress, born in Brooklyn, N. Y., in 1832; died in

Kansas City, Mo., July 12, 1902. In early youth she played in support of Edwin Forrest and William Macready, and in later years she acted with Edwin Booth, Joseph Jefferson, Lawrence Barrett, and other stars. When Joseph Jefferson first produced his famous play, *Rip Van Winkle*, Miss Bridges was the original Gretchen. She made her last appearance in 1887, in *Fogg's Ferry*. She was first married, while very young, to Tunis J. Johnson, and after his death she became the wife of Charles H. Erwin. She possessed a pleasing personality and was a great favorite with the public for many years.

Brooks, Elbridge Streeter, author, born in Lowell, Mass., April 14, 1846; died in Somerville, Mass., Jan. 7, 1902. He was the son of a Universalist clergyman, was educated in what is now the College of the City of New York, and in early manhood was employed in the publishing house of D. Appleton and Company. For about fifteen years he was connected with New York book firms and was a member of the editorial staff of the *Brooklyn Daily Times*. From 1884 to 1887 he was an assistant editor of the *St. Nicholas Magazine*, and then, removing to Boston, he became connected with the publishing firm of D. Lothrop & Co. He edited the *Wide Awake Magazine* a few years, and on the reorganization of the Lothrop firm in 1895 became its literary adviser, and so continued until his death. With few exceptions, his writings are for young persons and are intended to popularize American history with juvenile readers and instill a sense of patriotism into the rising generation. In this aim he was eminently successful, and his books have attained a wide circulation. He was a member of the Authors Club of New York, and one of the founders of the later Boston Authors Club. He was a man of great kindness of disposition, and in spite of an overwhelming press of duties was always ready to extend a helping hand to younger writers who sought his advice or aid. Beside editing several works, such as *Great Cities of the World* (1890) and *The Boy Life of Napoleon* (1895), he was the author of *The Life Work of Elbridge Gerry Brooks* (his father) (1880); *In No-Man's Land*, a work similar to *Alice in Wonderland* (1885); *Historic Boys* (1885); *In Leisler's Times* (1886); *Chivalric Days* (1886); *Storied Holidays* (1887); *Historic Girls* (1887); *The Story of the American Indian* (1887); *The Story of New York* (1888); *The Story of the American Sailor* (1888); *The Story of the American Soldier* (1889); *A Son of Issachar*, a novel (1890); *The Story of the United States* (1891); *The True Story of Christopher Columbus* (1892); *Heroic Happenings* (1893); *The Century Book for Young Americans* (1894); *The True Story of George Washington* (1895); *A Boy of the First Empire* (1895); *Great Men's Sons* (1895); *The Story of Miriam of Magdala* (1895); *Under the Tamaracks* (1896); *The True Story of Abraham Lincoln* (1896); *The Century Book of Famous Americans* (1896); *The Long Walls* (with J. Alden) (1896); *The True Story of Ulysses S. Grant* (1897); *The Century Book of the American Revolution* (1897); *A Son of the Revolution* (1898); *The True Story of Benjamin Franklin* (1898); *The Master of the Strong Hearts* (1898); *Stories of the Old Bay State* (1899); *The Story of our War with Spain* (1899); *Historic Americans* (1899); *The True Story of Lafayette* (1899); *On Woodcove Island* (1899); *In Blue and White* (1899); *The Story of the Nineteenth Century* (1900); *A Godson of Lafayette* (1900); *With Lawton and Roberts* (1900); *The Century Book of the American Col-*

onies (1900); *In Defense of the Flag* (1900); *Animals in Action* (1901); and *Under the Allied Flags* (1901).

Brown, Egbert Benson, military officer, born in Brownsville, N. Y., Oct. 24, 1816; died in West Plains, Mo., Feb. 11, 1902. He received but little education, and at the age of thirteen went to work. Later he removed to Toledo, Ohio, of which city he became mayor. At the close of his term he engaged in railroad enterprises, but he abandoned them when the civil war began and raised a regiment of infantry. He was severely wounded at the battle of Springfield; was promoted brigadier-general of volunteers; and served till the close of the war. He was United States pension agent in St. Louis in 1866-'68, and afterward lived in retirement.

Brown, John Appleton, artist, born in Newburyport, Mass., July 24, 1844; died in New York city, Jan. 18, 1902. He studied art in Boston under B. C. Porter, and later in Paris under Emile Lambinet, and on his return to the United States opened a studio in Boston, where he had a yearly exhibition of his works. He gained a high reputation as a landscape-painter. His works include *A View at Dives Calvados, France; Summer; On the Merrimac at Newburyport; Autumn; A Storm at the Isles of Shoals; Glen Mill Brook; Springtime; and A May Day*.

Brown, Susan Dod, philanthropist, born in Mendham, N. J., Feb. 1, 1812; died in New York city, Oct. 10, 1902. For many years she supported several missionaries in foreign fields and in home work. She gave to Princeton University the Albert Dod Hall and the David Brown Hall (cost together, upward of \$200,000), and to Lincoln University, Illinois, the Mary Dod Chapel. She also contributed liberally to the support of religious, educational, and benevolent institutions.

Brown, William Bryant, clergyman, born in Thompson, Conn., June 29, 1816; died in East Orange, N. J., Aug. 3, 1902. He was educated at Oberlin College, and became pastor of a Congregational church in Hartford, Ohio, and later in Henrietta, N. Y. In 1854 he was called to the First Congregational Church, Newark, N. J., and remained at this post nearly twenty-five years, during which period he aided in forming 30 new churches. He was the author of *The Problem of Final Destiny, An Intertwined Congregational and Presbyterian History in New Jersey and the Middle Provinces, and The Gospel of the Kingdom and the Gospel of the Church*, his last literary work, which was published a few months before his death. Dr. Brown was also an artist. He painted a large canvas showing his conception of a bit of landscape in a remote geological period and exhibiting various forms of probable or extinct animal and vegetable life. He was also an accomplished portrait-painter, and was in the habit of painting the portraits of the children of his congregation who died, for presentation to their parents. He was a lifelong and enthusiastic student of geology and mineralogy, and had made a large and valuable collection of specimens.

Browne, Junius Henri, author, born in Seneca Falls, N. Y.; died in New York city, April 2, 1902. He was educated at St. Xavier College, Cincinnati, Ohio; and later removed to New York city, where he resided till his death. He was a journalist, war correspondent, and author. Among his best known works are *Four Years in Secessia* (1865); *The Great Metropolis: A Mirror of New York* (1869); and *Sights and Sensations in Europe* (1872).

Bruce, Saunders Dewers, author, born in Lexington, Ky., Aug. 16, 1825; died in New York city, Jan. 31, 1902. He was graduated at Transylvania University in 1846, and two years later engaged in business. When the civil war broke out he enlisted in the National army; became inspector-general of the Union Home Guards of Kentucky; built fortifications at the mouth of Cumberland river; had command of the 22d Brigade in the battle of Shiloh (where he was wounded), and of the provisional brigade that opened Cumberland river below Fort Donelson. He resigned on account of failing health in 1864, and removed to New York, where he became widely known as an authority on the pedigree of horses. He compiled the American Stud-Book, and wrote *The Thoroughbred Horse*.

Bryant, John Howard, poet, born in Cummington, Mass., July 22, 1807; died in Princeton, Ill., Jan. 14, 1902. He was the youngest brother of William Cullen Bryant, and was educated at Rensselaer Polytechnic Institute, Troy, N. Y. He settled in Jacksonville, Ill., in 1831, and a year later in Princeton, where he lived until his death. He became a justice of the peace for Putnam County in 1834; recorder of deeds for Bureau County in 1837; was twice a member of the State Legislature; frequently served on the Board of Supervisors; and was for fifteen years a member of the Board of Education, during part of this time acting as chairman. He was the author of *Poems, Life and Poems*, and several addresses.

Bryant, Neil, actor and minstrel performer, born in Keesville, N. Y., in 1835; died in Brooklyn, N. Y., March 6, 1902. He was the last of the three Bryant brothers, who at one time were at the head of the class of entertainment known as negro minstrels. His two older brothers had been playing some years before he made his first appearance, in 1845, but within a year after his *début* he was acknowledged to be the champion flute-player of America. He traveled for several seasons in the West and the South, and in 1853 he entered into partnership with his two brothers, Jerry and Dan, in the management of a New York theater. They organized a minstrel company called *The Corkonians*, and opened at Mechanics' Hall, No. 472 Broadway, in the autumn of 1857. They remained at that theater ten years, during which time they gained great popularity and a large fortune. In 1867, the oldest brother having died, Neil and Dan Bryant removed their company to the Tammany building, where Tony Pastor's Theater now stands. Here they gave minstrel performances until 1870, when they removed again to a hall in Twenty-third Street, near Sixth Avenue. When the building in East Fourteenth Street known as Tammany Hall was erected, Neil Bryant was chosen to lay the corner-stone. In 1875 Dan Bryant died, and the company was disbanded. In 1877 Neil organized a new company, calling it by the old name of Bryant's Minstrels, and opened at the New York Theater, on Broadway, near Eighth Street. The venture was unsuccessful, as the public had apparently wearied of that form of entertainment, and Bryant lost most of his money and was obliged to close the theater. In 1883 he retired from the stage and took a place in the sheriff's office, which he held until he received an appointment in the office of the Coast Survey, where he remained until 1900, when his enfeebled physical condition compelled him to retire.

Buck, Alfred Ellab, diplomatist, born in Foxcroft, Me., Feb. 7, 1832; died in Tokio, Japan, Dec. 4, 1902. He received a collegiate education, and became principal of the Lewiston (Me.) High

School, and later superintendent of the public schools of that city. When the civil war broke out he raised a company for the 13th Maine Volunteers, of which he became captain. In 1863 he recruited a colored regiment, of which he became colonel, and he was present at the capture of Fort Blakely, Mobile. In 1865 he was made inspector-general for western Louisiana, and in June, 1866, was mustered out. After the war he settled in Mobile, Ala., and engaged in the manufacture of turpentine. He was elected to Congress in 1869; was president of the Mobile City Council in 1873; and in the latter year removed to Atlanta, Ga., where he was clerk of the United States circuit and district courts in 1873-'87, and United States marshal for Georgia in 1889. In 1897 he was appointed minister to Japan by President McKinley, which post he held till his sudden death while hunting with the Emperor.

Burdett, Charles L., civil engineer, born in Nantucket, Mass., Sept. 3, 1848; died in Hartford, Conn., Feb. 21, 1902. He removed to Hartford, Conn., in 1882, where he lived until his death. Besides practising as a civil engineer, he was noted as a patent lawyer. He organized the signal corps of the Connecticut National Guard, and was signal officer on the brigade staff for several years. He was appointed colonel of the 1st Regiment of the National Guard of Connecticut in 1884, and at the outbreak of the war against Spain in 1898 he enlisted with a large part of his regiment, and was stationed first in Maine and later at Camp Alger, near Washington, where he remained till the close of the war.

Burke, Joseph, violinist, born in Galway, Ireland, about 1816; died in New York city, Jan. 19, 1902. He went on the stage when eight years of age, and traveled through Europe as musician and actor. In 1830 he came to the United States, where he acted for a time; later studied law in Albany, N. Y., and was admitted to the bar in 1840, but never practised. Jenny Lind selected him as her accompanist during her American concert tour in 1850-'51, and he was widely known as an instructor on the violin till his retirement in 1880.

Butler, William Allen, lawyer and author, born in Albany, N. Y., Feb. 20, 1825; died in Yonkers, N. Y., Sept. 9, 1902. He was the son of Benjamin F. Butler, who was Attorney-General of the United States in the administrations of Jackson and Van Buren. He was graduated at the University of the City of New York in 1843, studied law with his father, and then traveled abroad, contributing to the *Literary World* a series of sketches entitled *Out-of-the-Way Places in Europe*. On his return he entered upon active law practise, which he pursued all his life. He contributed frequently to periodicals, in prose and in poetry, two of his series being *The Cities of Art* and *The Early Artists* and a humorous one entitled *The Colonel's Club*. He published *The Future*, an academic poem, in 1846, and in 1850 *Barnum's Parnassus*, similar to the famous *Rejected Addresses*. His great hit was *Nothing to Wear*, a satirical poem, which appeared first in *Harper's Weekly*, and then in book-form, obtained immediate celebrity, was reprinted in England, and was translated into French and German. It was also followed by several imitations—*Nothing to Say*, *Nothing to Do*, *Nothing to Eat*, etc. Mr. Butler's poem *Two Millions* was written for delivery before the Phi Beta Kappa Society of Yale University; his *General Average* is a satire on mercantile life. In 1860 he delivered before the Bible Society an address on *The*

Bible by Itself. Two years later he published a biographical sketch of Martin Van Buren, and in 1871 Lawyer and Client, first delivered as a lecture before the Law School of the University of the City of New York. His collected poems were published in one volume in Boston in 1871. In prose he published, anonymously, *Mrs. Limber's Raffle* (1876) and *Domesticus*, a story relating to the labor question (1886). He also delivered or published numerous other addresses and sketches. For portrait, see frontispiece.

Carlton, Charles, educator, born in Eythorne, Kent, England, Aug. 21, 1821; died in Bonham, Texas, Feb. 13, 1902. He went to Toronto, Canada, with his parents in 1854; was a seaman several years; and later worked on a farm in Fredonia, N. Y. While farming he studied for the ministry, and was graduated at Bethany College, West Virginia, in 1849. He held pastorates in a Baptist church in Georgetown, Ky., in 1849-'50; in Lexington, Mo., and Little Rock, and Van Buren, Ark., where he also engaged in teaching, extending his labors from Fort Smith and Fayetteville to Waldron. When the civil war broke out he removed to Texas, and settled on a farm in Collins County, where he remained a year, when he removed to Dallas and resumed his work as teacher and preacher. In 1867 he removed to Bonham, where he resided till his death. Here he established the coeducational school known as Bonham Seminary, which in 1882 became an institution exclusively for women, the name being changed to Carlton College. He was active in the organization of the American Christian Missionary Society in 1849, and was also one of the leaders in the Christian denomination in Texas.

Catherwood, Mary Hartwell, author, born in Luray, Ohio, Dec. 16, 1847; died in Chicago, Ill., Dec. 26, 1902. She was graduated at the Female College in Granville, Ohio, in 1868; and married John Steele Catherwood in 1887. She began her literary career as contributor to a juvenile magazine, and later she was on the editorial staff of the *Chicago Graphic*. She was the author of *Craque-o'-Doom*; *Old Caravan Days*; *The Secret of Roseladies*; *The Romance of Dollard*; *The Belle of Ste. Anne*; *The Story of Tonty*; *The Lady of Fort St. John*; *Old Kaskaskia*; *The White Islander*; *The Chase of St. Castin and Other Tales*; *The Spirit of an Illinois Town and the Little Renault*; *The Days of Jeanne d'Arc*; *Bony and Ban*; *Mackinac and Lake Stories*; *Spanish Paggy*; and *Lazarre*.

Channing, Blanche Mary, author, born in Liverpool, England, about 1863; died in Brookline, Mass., Aug. 9, 1902. She was the daughter of the Rev. William Henry Channing, for many years a Unitarian minister in Liverpool, and a grand-niece of Dr. William Ellery Channing. Her earlier years were spent in England, but in 1890 she came to the United States and made her home in Brookline, where she engaged in literary work and the designing of posters and book-covers. Her published books include *Zodiac Stories* (1899); *Winifred West* (1901); and *The Balaster Boys* (1902).

Charles, Brother (name in religion), educator, born in Paterson, N. J., in 1855; died in New York city, March 11, 1902. He was graduated with high honors in 1874 at Manhattan College, of which he later became president, holding the office till his death. In adopting the career of teacher he interested himself especially in Latin literature, and for many years was widely known in the educational work of the Roman Catholic Church in the United States.

Chase, Jefferson, inventor, born in Concord, Vt., July 24, 1831; died in Portland, Me., May 20, 1902. He was a son of John Denison Chase, the inventor of the first all-iron-and-steel circular-saw mill made in New England. At an early age Jefferson showed a tendency to follow in his father's footsteps. He became associated with his father and brother under the firm name of the Chase Turbine Manufacturing Company, which in 1855 introduced the Chase water-wheel, a device that rapidly grew in favor. Mr. Chase had taken out 34 patents since his twenty-fifth birthday. These include the automatic shingle and heading machine, the lever set circular-saw mill, the traveling-bed planer, the automatic grooving machine, the self-shipping power-feed saw machine, and the lath machine and bolter. At the Centennial Exhibition in Philadelphia in 1876, while Mr. Chase was exhibiting some of his inventions, he became interested in some paper mills that were exhibited. These were made with sheets of paper wound round a block. He at once began experimenting, substituting wood-pulp for paper, and in 1883 made the first wood-pulp pails, tubs, etc. His son, the late William I. Chase, then invented machines for making these articles.

Cist, Henry Martyn, military officer, born in Cincinnati, Ohio, Feb. 20, 1839; died in Rome, Italy, Dec. 17, 1902. He was graduated at Farmer's (now Belmont) College in 1858, and studied law. When the civil war broke out he enlisted as a private in the 6th Ohio Infantry; was promoted to 2d lieutenant, then adjutant, and later major; and resigned from the army Jan. 4, 1866, with the rank of brevet brigadier-general. He was post adjutant of Camp Chase during the confinement of the Confederate prisoners captured at Fort Donelson, and served in Middle Tennessee and in the Chickamauga and Eastport campaigns. After the war he practised law in Cincinnati; was mayor of College Hill, Ohio, two terms; corresponding secretary of the Society of the Cumberland in 1869-'92; contributor to periodicals on civil-war subjects; and author of *The Army of the Cumberland* (1882); *Life of Major-Gen. George H. Thomas*, etc. He was president of the Ohio Chapter of the Sons of the American Revolution, and originator of the movement that resulted in the conversion of the Chickamauga battle-field into a national park.

Clark, Edward, architect, born in Philadelphia, Pa., in 1822; died in Washington, D. C., Jan. 6, 1902. He received an academic education; studied architecture with Thomas U. Walter, and when the latter became architect of the United States Capitol Extension was appointed his assistant. In 1865 Mr. Walter resigned, and Mr. Clark was appointed his successor, and in that office he served continuously until his death. He was a member of the commissions on the completion of the Washington Monument and the construction of the Library of Congress, and served on various other commissions for special Government work. In addition to his duties as architect of the Capitol, Mr. Clark had charge of improving the Smithsonian Institution, repairing the local court-house, and drawing plans for schoolhouses in Alaska. He was a trustee of the Corcoran Art Gallery and a member of numerous scientific societies.

Clark, Heman, contractor, born in Ohio about 1839; died in New York city, Sept. 7, 1902. He was educated at Hiram College, taught school for a short time, and then went to Pike's Peak, where he worked in the gold-mines. Later he removed to Salt Lake City and conveyed supplies

to the army post in that city from St. Louis under a contract with the Government. He also was an Indian agent for several years. He laid out the present town of Billings, Mont., and also formed a mining company and built extensive works there. He removed to California, where he was associated in business with men who afterward became very wealthy through mining enterprises. As a contractor Mr. Clark did considerable railroad building in Alabama and Nova Scotia, and then completed his greatest railroad work, the Northern Pacific. After finishing this railroad, he removed to New York city, where he formed the firm of O'Brien & Clark, which obtained the contract for building the New Croton Aqueduct. Mr. Clark's last engineering work was the construction of the Harlem River drawbridge for the New York Central Railroad.

Clark, William, manufacturer, born in Paisley, Scotland, in 1841; died in Portland, England, July 7, 1902. He entered the thread-mills in Scotland founded by his ancestors, and mastered the details of every department of the business. In 1860 he joined his brother, George A. Clark, who came to the United States in 1856, and established a branch of the Paisley establishment on a small scale, from which grew the great works in Newark, N. J. George A. Clark died in 1873, and William Clark became sole manager of the business. (See GIFTS AND BEQUESTS.)

Clarke, Annie, actress, born in Boston in 1845; died in Chicago May 22, 1902. She made her first appearance at the Boston Museum, in 1853, as the Duke of York in Richard III. Early in her experience with this company she appeared as Polly in Uncle Tom's Cabin when the play was first performed in Boston, and she played a juvenile rôle in The Silver Spoon. In 1856 she was one of the fairies in a spectacular production of A Midsummer Night's Dream. She then joined the Boston Howard Athenæum for a season, playing child's parts, after which she traveled in the New England States with various organizations. In 1861 she returned to the Boston Museum, occupying a secondary place for a few seasons, afterward becoming the leading actress and appearing for many years in the principal rôles of all the plays produced at that theater. It was a famous company that she acted with, including such players as William Warren, Charles Barron, and Mrs. Vincent, and Miss Clarke was their worthy associate, as she developed into a brilliant and versatile actress, in classical plays as well as in the modern drama. She became famous throughout the country, but seldom acted elsewhere than in Boston. The Museum was one of the last of the old theaters to keep its company together, but in 1892 its doors as a stock theater were closed, the plays on that occasion being A Scrap of Paper and Masks and Faces, in each of which Miss Clarke played the leading character. After this she played in several different companies, appearing with Richard Mansfield, Olga Nethersole, and Julia Marlowe. Her last appearance was in Chicago, where she was acting in Miss Marlowe's production of When Knighthood was in Flower at the time of her death. Miss Clarke was a highly accomplished woman, a great favorite professionally and socially, and one of the best-known stock actresses of her time.

Collis, Charles H. T., military officer; born in Cork, Ireland, Feb. 4, 1838; died in Philadelphia, Pa., March 11, 1902. He came to the United States in 1853, and was admitted to the bar in Philadelphia in 1859. His first military service was as sergeant-major in the 18th Pennsylvania

Volunteers in April, 1861. After serving three months with his regiment in Baltimore, he raised a company of infantry, with which he took part in operations in the Shenandoah valley. His first commission was as captain, and he was soon made colonel of the 114th Pennsylvania Volunteers. For bravery at Fredericksburg he received a Congress medal. At Chancellorsville the regiment took and held for some time the breastworks defended by Trimble's division of the enemy. Col. Collis was recommended as a brigade commander, but he was attacked with typhoid fever, and was sent to his home. Late in the same year, in the Mine Run campaign, a horse was shot under him. At Spottsylvania, in May, 1864, he performed a service that won the praise of Gen. Grant and gained for him the rank of brigadier-general. Before Petersburg, April 2, 1865, a portion of the 9th Corps having been driven back from the works they had stormed and captured, Gen. Collis, who had been ordered to the spot by Gen. Grant to assist Gen. Parke, rushed to their relief, leading the 114th Pennsylvania Volunteers and 61st Massachusetts in person, retaking all the lost ground and advancing to an inner line of works. This was not accomplished without serious loss of life. Three officers of his own regiment were killed in the assault. For his conduct on this occasion he was brevetted major-general at the request of Gen. Grant. In June, 1865, he was mustered out, and at once resumed the practise of law in Philadelphia. He was elected city solicitor in 1871 and 1874, and was for many years a member of the Board of Directors of Public Trusts of Philadelphia. In 1882 he removed to New York city, where he connected himself with the anti-Platt branch of the Republican party. He became a member of the Republican County Committee and the Committee of Thirty, which undertook the reorganization of the Republican party in 1894. In the following year he was appointed deputy commissioner of public works in the Strong administration, and later in the same year he became commissioner. He served in this office till the expiration of Mayor Strong's administration, Jan. 1, 1898. On the advent of the administration of Mayor Van Wyck, charges were laid against Gen. Collis of carelessness, incompetency, and favoritism as commissioner, but the grand jury promptly dismissed them.

Cooke, Lorrin Alanson, manufacturer, born in New Marlboro, Mass., April 6, 1831; died in Winsted, Conn., Aug. 12, 1902. He was educated at Norfolk Academy, taught school a few years, and then settled on a farm. In 1856 he was elected to the Connecticut Legislature; served four years in the State Senate; was elected Lieutenant-Governor in 1884 and 1894, and Governor in 1896. He was a director of the State Industrial School for Girls and the State Humane Society, and was a trustee of Hartford Theological Seminary.

Corrigan, Michael Augustine, third Roman Catholic archbishop of the diocese of New York, born in Newark, N. J., Aug. 13, 1839; died in New York city, May 5, 1902. His parents emigrated from the province of Leinster, Ireland, to America early in the last century and settled in Newark. They gave their son a good education, first at St. Mary's College, Wilmington, Del., and then at Mount St. Mary's College, Emmetsburg, Md., where he took the lead in his classes. In his junior year he made a tour of Europe with his sister, and returned to complete his course in 1859. By this time he had made up his mind to enter the priesthood. He was one

of the 12 theological students with whom the American college in Rome was opened, after he had devoted a year to preliminary studies, including Italian and Hebrew. He was an industrious student, and won several medals, and his piety and scrupulous obedience caused his superiors to consent to his becoming a priest a year before the close of his theological course. He was ordained on Sept. 19, 1863. He finished his studies in 1864, obtaining the degree of D. D. after a rigorous examination. In July of that year he returned to the United States. Bishop Bayley, of Newark, appointed him director of the

ecclesiastical seminary at Seton Hall College, South Orange, N. J., and made him Professor of Dogmatic Theology and Sacred Scripture in that institution, and he was soon made vice-president of Seton Hall, and in 1868 became head of the college. To his other duties were added in 1870 those of administrator and vicar-general of the diocese of Newark during the absence of Bishop Bayley at Rome. Early in 1873 Bishop Bayley was made Archbishop of Baltimore, and in March of that year Pope Pius IX made Dr. Corrigan Bishop of Newark, his consecration taking place on May 4. He retained the presidency of Seton Hall College until 1876, when he resigned in favor of the vice-president, his brother, the Rev. James H. Corrigan. During his episcopate in Newark he opened a reformatory for boys, a refuge for women, and an orphan asylum, introduced into New Jersey the Jesuits and Dominicans, founded a convent for the Dominican nuns of the Perpetual Adoration, dedicated 42 new churches, and consecrated the Newark Cathedral. On Sept. 26, 1880, owing to the age and infirmities of Cardinal McCloskey, Pope Leo appointed Bishop Corrigan as coadjutor for the diocese of New York, with the title of Archbishop of Petra and the right of succession. Thus he became the youngest archbishop in the United States, with the exception of Archbishop Seghers, as he had been the youngest bishop. Nearly all the practical work of the diocese devolved upon him. On Oct. 10, 1885, by the death of Cardinal McCloskey, he became Archbishop of New York, and he was invested with the pallium in March, 1886. Within three months he was confronted with the most serious controversy that ever disturbed the Catholic community in the United States. Henry George had been selected by the working men as candidate for mayor of New York and began to preach his doctrines, declaring private ownership of land unjust. He was supported by many of the Catholic clergy, and Dr. Edward McGlynn, pastor of St. Stephen's Church, openly espoused his cause. Archbishop Corrigan opposed the doctrines, and his vicar-general declared them to be heretical. Henry George was defeated, but immediately began preparations for the State campaign next year. Archbishop Corrigan, in a pastoral letter, defended ownership of land as the only means of securing the rights of property, which he based on the right of man to what he produces. Mr. George replied that exclusive possession would secure the same right and prevent an unearned increment being drawn in the form of rent from

those who did not own land. Archbishop Corrigan forbade Dr. McGlynn to continue his support, and complained to Pope Leo that the priest was attacking the rights of property. Dr. McGlynn was excommunicated, and Henry George was defeated at the election of 1887. Later, when Archbishop Satolli became papal legate at Washington, the case was reopened. Dr. McGlynn was restored to his priestly functions, and Archbishop Corrigan gave him a parish in Newburg. Subsequently a great public reception was tendered to Archbishop Corrigan in recognition of his defense of landed interests, in which not only Catholics but representatives of New York's wealthy families took part. In the Cabenaly controversy, which became acute in 1890, Archbishop Corrigan refrained from taking an active part, although he sympathized to some extent with the wishes of the Austrian nobleman that emigrants coming to America from different European countries should have placed over them bishops of their own nationalities. Cardinal Gibbons and Archbishop Ireland opposed the idea, and the Propaganda soon afterward condemned it. Archbishop Corrigan wrote a letter to Herr Cabenaly, complimenting him on his work in behalf of German-speaking immigrants, but saying that every one must abide by the decision of the Propaganda. In the seventeen years of his episcopate the Catholic population of the archdiocese of New York grew to be about a million and a half. It includes the counties of New York, Westchester, Putnam, Dutchess, Ulster, Sullivan, Orange, Rockland, and Richmond in the State of New York, and the Bahama Islands, to which the archbishop made periodical visits. On Feb. 23, 1902, while the archbishop was going from his house to the cathedral adjoining, he fell into an excavation under the pathway which had not been sufficiently boarded over, and received a severe shock, from which he did not recover for several weeks. In April he went to Washington to attend a meeting of the Catholic University, and took a severe cold on the trip, which developed into pneumonia on his return and caused his death. He was succeeded by the Right Rev. John M. Farley, who had been auxiliary bishop since 1896.

Cory, Florence Elizabeth, designer, born in Syracuse, N. Y.; died in New York city, March 20, 1902. In 1877 she took up the art of designing, became the first practical textile designer among American women, and founded and conducted the School of Industrial Art and Technical Design for Women in New York city. She was led to engage in textile designing by the sight of some costly but inartistic carpets, and was aided in her early efforts by the president of a carpet company in Connecticut and by the officials of other representative factories. She learned that tasteful designs were often rejected because they could not be woven, and that there was a limitation to machinery. This led her to study the mechanical part of the industry, and in time she became a successful designer not only of carpets, but of wall-paper and of silk and woolen goods.

Cowie, George, naval officer, born in Scotland in 1846; died in Rahway, N. J., May 23, 1902. He was appointed an acting third assistant engineer in the navy May 23, 1864; commissioned second assistant engineer July 9, 1870; promoted passed assistant engineer Dec. 3, 1876; chief engineer Sept. 12, 1892; lieutenant-commander March 3, 1899; commander July 1, 1899, and captain Feb. 11, 1901; and was advanced three numbers on the retired list of captains for eminent and conspicuous conduct in battle. He partici-

pated in both attacks on Fort Fisher, and was honorably discharged with the thanks of the Navy Department, Dec. 19, 1867. He served on the Mayflower and Pinta during the Virginius affair in 1873, and afterward on the flagship Hartford, the Blake, and the Yantic. During the war against Spain in 1898 he commanded the Indiana, and he was present at the destruction of Cervera's fleet, for which service the President advanced him three numbers. At the close of the war he was sent to the Philippines, and later he was assigned to duty at the New York Navy-Yard.

Crocker, Uriel Haskell, lawyer, born in Boston, Mass., Dec. 24, 1832; died there, March 8, 1902. He was graduated at Harvard University in 1853, studied at Harvard Law School, was admitted to the bar in 1856, and was in active practise till his death. He was a member of the Common Council in 1874-'78, and was appointed one of the commissioners to revise the statutes of Massachusetts in 1881. Among his publications were Notes on the Public Statutes of Massachusetts; Notes on Common Form; and Notes on the Revised Laws. He was prominent in charitable and philanthropic work, and was connected officially with several financial and public institutions.

Cummings, Amos Jay, journalist, born in Conkling, N. Y., May 15, 1841; died in Baltimore, Md., May 2, 1902. When a boy he entered his father's printing-office, but he soon afterward set out for himself, and for four years worked as a compositor in the West and South. Later he worked in the New York Tribune office. When the civil war broke out he enlisted in the volunteer service. He participated in many battles, and in 1863 was compelled by illness to return to New York, where he arrived in time to take part in the defense of the Tribune office when it was mobbed by the rioters in July. Subsequently he became successively night editor, city editor, and political editor of the Tribune, and still later he was on the staff of the New York Express and the Sun successively. He was elected to Congress in 1887, and retained his seat until his death. His publications include Sayings of Uncle Rufus and Ziska Letters.

Cutler, Henry Stephen, musician, born in Boston, Mass., Oct. 7, 1824; died in Swampscott, Mass., Dec. 6, 1902. He was organist and choir-master of Trinity Episcopal Church, New York city, in 1860-'68. When King Edward VII, then Prince of Wales, visited the United States in 1860, Dr. Cutler robed the boys and men in the choir according to the custom of the English Church, out of respect to the prince. The idea was at once taken up in several Episcopal churches, and vested choirs soon became general. In 1864 Columbia College conferred on him the degree of doctor of music. His musical compositions were numerous. He compiled The Psalter, with Chants (1858); Trinity Psalter (1863); and Trinity Anthems (1868). His musical setting of the hymn The Son of God goes forth to War is perhaps the best known of any American tune in the Hymnal.

Davidson, Andrew, military officer, born in Roxburghshire, Scotland, Feb. 12, 1840; died in Bath, N. Y., Nov. 10, 1902. He came to the United States with his parents, who settled in Otsego County, N. Y., in 1848. When the civil war broke out he enlisted as a private. Later he was commissioned a 1st lieutenant in the 30th United States Colored Infantry, of which he subsequently became adjutant. At the battle of Salem Church he was shot through both legs; at Hatcher's Run was wounded in the hand; and

at Petersburg in the face. After the war he studied law and practised till 1874, when he purchased the Otsego Republican, which he was then editing. He was a State Senator in 1884-'85; First Deputy Commissioner of Pensions under President Harrison; Deputy Secretary of State of New York in 1894; then Deputy State Treasurer; and afterward commandant of the New York State Soldiers' and Sailors' Home in Bath. Col. Davidson received the congressional medal of honor.

Davis, Noah, jurist, born in Haverhill, N. H., Sept. 10, 1818; died in New York city, March 20, 1902. He studied law, was admitted to the bar in 1841, and practised in Gaines, N. Y., and Buffalo, N. Y. In 1844 he entered into partnership with Sanford E. Church, with whom he practised in Albion, N. Y., till 1857, when he was made a justice of the State Supreme Court. He was twice reelected to this office, but in 1868 he resigned, having been elected to Congress, where he served from March 4, 1869, till July 20, 1870, when President Grant appointed him United States Attorney for the Southern District of New York. He resigned this office Dec. 31, 1872, on being elected justice of the Supreme Court of New York, where he served till December, 1887. A short time after Justice Davis took his seat on the bench the trial of William M. Tweed for malfeasance in office was held before him. He sentenced Tweed to a year's imprisonment for each of the 12 counts of the indictment; but two years later the Court of Appeals decided that this cumulative sentence was contrary to law. He resumed private practise in New York city as head of the firm of Davis & Marsh till 1901, when he retired.

Daxian, Wolf, theatrical costumer, born in Wurzburg, Bavaria, in 1816; died in New York, Jan. 10, 1902. He came to America in 1835, and in 1842 he founded the first and the most important costume establishment in this country. He imported theatrical and fancy dresses, and built up a large and profitable business. He furnished the costumes for the most notable dramatic and operatic productions of his time, chief among which was the first spectacular play presented in this country, The Black Crook, which was played at Niblo's Garden, New York city. He was the chief costumer for the Metropolitan Opera House, New York, in all its great productions of grand opera that required brilliant accessories of dressing and drapery.

Dean, John Ward, genealogist, born in Wiscasset, Me., March 13, 1815; died in Medford, Mass., Jan. 22, 1902. He was educated in the public schools of Portland, and, after learning the bookbinder's trade, removed to Boston, presently setting up in business in Providence, but subsequently returning to Boston, where he conducted a bookbinding establishment till in 1872 he was appointed librarian of the New England Historic Genealogical Society, in which office he continued, save from 1889 to 1893, until the time of his death. He had become a member of that society in 1850, and his wide knowledge of New England family and local history was thereafter so constantly extending that he became almost, if not quite, the chief authority in such matters.

His acquaintance with the literature and persons of the seventeenth century in New England was extremely thorough, and, while he had few of the graces of style, he was always clear in his presentation of a theme and discriminating in his choice of material. Besides frequent contributions to the New England Historical and Genealogical Register, of which he was editor in 1876-1902, Mr. Dean was the author of *A Memoir of the Rev. Nathaniel Ward* (1868) and *A Memoir of Rev. Michael Wigglesworth* (1871).

Depue, David Ayres, jurist, born in Mount Bethlehem, Pa., Oct. 27, 1826; died in Newark,

N. J., April 3, 1902. He was graduated at Princeton University in 1846. In 1849 he was admitted to the bar and began practice in Belvidere, N. J., where he remained till 1866, when he was appointed a judge of the Supreme Court, where he remained by successive appointments till 1900. On May 1, 1900, he was commissioned Chief Justice of the Supreme Court of New Jersey, and he

held that office till Nov. 16, 1901, when he resigned after thirty-five years of service.

Dickerman, Lyander, Egyptologist, born in Bridgewater, Mass., in 1830; died in Boston, Mass., Dec. 13, 1902. He was graduated at Brown University in 1851, and at Andover Theological Seminary in 1856; was ordained in the Congregational Church in 1858; held pastorates in Massachusetts and New Hampshire till 1869, and then spent two years in the University of Berlin. In 1873 he was called to a church in Quincy, Ill., and later held charges in Gilroy and Chico, Cal. Since 1878 he had supplied pulpits in Boston, New York, and elsewhere. He spent much time in travel, especially as an antiquary, and became well versed in Egyptology. His publications include *The Egyptian Deities* (1885); *The Hittites of the Bible* (1889); *The Fayam* (1892); and *Mariette-Bey's Monument of Upper Egypt* (1900).

Drummond, Josiah Hayden, jurist, born in Maine in 1827; died in Portland, Me., Oct. 25, 1902. He was admitted to the bar and practised in Waterville till 1860, when he removed to Portland. He served in both houses of the State Legislature; was Attorney-General of the State in 1860-'64; a delegate to the Republican National Convention in 1864, 1876, and 1884; and a director of the Maine Central Railroad from 1865 till his death. His publications included *Maine Masonic Text-book for the Use of Lodges*; *History of Masonic Jurisprudence*; and the article on *Masonry in the Universal Cyclopaedia and Atlas*.

Earl, Robert, jurist, born in Herkimer, N. Y., Sept. 10, 1824; died there, Dec. 2, 1902. He was graduated at Union College; was principal of Herkimer Academy two years, during which time he studied law; and was admitted to the bar in 1848 in his native town, where he practised till 1870. He edited the *Herkimer Democrat* several years, and was supervisor of Herkimer County in 1849 and 1860; judge and surrogate of the same county in 1856-'60; judge of the old Court of Appeals in 1869-'70, and then its chief justice.

He was a member of the Commission of Appeals till July, 1875, and was elected judge of the new Court of Appeals in the following year, which post he held till he retired in 1895. He was a founder and later president of the Herkimer County Historical Society, and with his wife founded the Herkimer Free Library and gave it property valued at \$30,000.

Eggleston, Edward, author, born in Vevay, Ind., Dec. 10, 1837; died at Joshua's Rock, Lake George, N. Y., Sept. 3, 1902. His father, who was a Virginian and a lawyer, died when Edward was nine years old. The son was prevented by delicate health from entering college, but by private study he acquired a liberal education. He spent four months in Minnesota, in 1856, for the benefit of his health, and then returned to Indiana and became a Methodist preacher, riding circuit. Six months later he went again to Minnesota, became general agent for the Bible Society, and was pastor of churches successively in St. Peters, St. Paul, Stillwater, and Winona. When his still delicate health forbade pastoral work he supported his family in various ways, which he himself characterized as "always honest, but sometimes very undignified." He removed to Evanston, Ill., in 1866, and for six years was associate editor of *The Little Corporal*, a popular juvenile periodical, of which Emily Huntington Miller was the chief editor. Mr. Eggleston had previously contributed to this publication a series entitled *Round-Table Stories*. Later he edited the *Sunday-School Teacher* in Chicago, which under his management increased its circulation from 5,000 to 35,000, and at the same time he became popular as an organizer of Sunday-school teachers' institutes and a speaker at their conventions. He had also become a regular contributor to the *New York Independent*, using the pen-name Penholder. In 1870 he became literary editor of that paper, and for a short time he was superintending editor. In 1871 he became chief editor of the newly established *Hearth and Home*, published in New York. In this periodical first appeared his story *The Hoosier Schoolmaster*, which was immediately popular, appeared in book form in 1871, has been translated into several European languages, and still has a steady sale in the United States. This was followed by *The End of the World* (1872); *The Mystery of Metropolisville* (1873); *The Circuit-Rider* (1874); *The Schoolmaster's Stories* (1874); *Roxy* (1878); *The Hoosier Schoolboy* (1883); *Queer Stories* (1884); *The Graysons* (1888); *The Faith Doctor* (1891); and *Duffels* (1893). He had published *Mr. Blake's Walking-Stick* in 1869. He looked upon his works of fiction as little more than so much work to earn money for historical investigation, since his ambition was the writing of history, for which he made preparation in costly research and minute study. He published a *History of the United States and its People*, for the use of schools (1888); a *Household History of the United States and its People* (1888); a *First Book in American History* (1889); and two volumes of an elaborate history of our country, entitled *The Beginners of a Nation* (1896) and *The Transit of Civilization* (1900). He edited *Christ in Art* (1874) and *Christ in Literature* (1875). Dr. Eggleston, who had received honorary degrees from several colleges, was a brilliant talker and a man of fine sympathies. When he returned from Ireland, whither he had been sent by a metropolitan newspaper to investigate the famine, he remarked, "I felt ashamed to have money in my pocket when I saw the condition of those poor people." For portrait, see frontispiece.

Ellis, Howard, lawyer, born in Elkon, Md., July 6, 1834; died in New York city, Dec. 24, 1902. He entered business life as a bank clerk in Philadelphia, and later studied law. At the outbreak of the civil war he, with his four brothers, assisted in raising the 6th Pennsylvania Cavalry, with which he served till 1863, when he retired with the rank of captain. He then removed to New York, where he practised his profession. In 1875 he began the publication of the *New York Weekly Digest*; later became editor of *The Law and Equity Reporter*, with which he remained for fourteen years, when he resigned to become United States consul-general in Holland. After his return from Rotterdam he acted as counsel for several business concerns and wrote on legal subjects, his last work in this line being *The Case Law*.

Emerson, William (William Emerson Redmond), familiarly known as "Billy" Emerson, actor and minstrel performer, born in Belfast, Ireland, in 1847; died in Boston, Mass., Feb. 22, 1902. He came to the United States when he was a year old, and made his first appearance as a "burnt-cork" negro minstrel when he was a lad of eleven in the Sweeney Minstrel Company. As he grew up he became a favorite with the public all over the country, for his sweet singing and graceful dancing. He commanded the highest salary ever paid to any minstrel performer, at one time receiving \$1,000 a week. He sang with Haverly's Minstrels for a long time, and was once in partnership with Ben Cotton, one of the noted minstrel singers in the palmy days of that form of amusement. Emerson went to San Francisco, and for ten years managed a company of his own. He made three very successful trips to Australia. In recent years he appeared as a monologist in vaudeville entertainments. His last appearance was at the Boston Theater in May, 1901, with West's Minstrel Company.

English, Thomas Dunn, author, physician, and lawyer, born in Philadelphia, Pa., June 29, 1819; died in Newark, N. J., April 1, 1902. He was graduated in medicine at the University of Pennsylvania in 1839; but he immediately took up the study of law, and was admitted to the bar in Philadelphia in 1842. His tastes had been strongly inclined toward literature from his early youth, and in 1844 he became editor of a daily paper in New York. In the following year he began the publication of a literary magazine, *The Aristidean*, of which only a single volume was issued. In 1843 he was asked to contribute a poem to the *New York Mirror*, and in the issue of Sept. 25 appeared *Ben Bolt*, the poem that made him famous. It won wide admiration in this country, and was soon stolen by English publishers and announced in England as the work of a British poet. It was set to the familiar air that accompanies it by Nelson Kneass in 1846, and was sung by him in theaters all over the United States. For many years the song dropped out of memory, but interest in it was revived by its use in George Du Maurier's novel *Trilby*. Soon after the publication of *Ben Bolt*, President Tyler offered a diplomatic post to the author, which was declined. Dr. English settled in New Jersey in 1859, making it his permanent home. He served in the New Jersey Legislature in 1863 and 1864, and was sent to the Fifty-second and Fifty-third Congresses as a Democrat. In 1876 he received the degree of doctor of laws from William and Mary College, Virginia. Among his writings, besides numerous poems and several plays and novels, are *Walter Woolfe* (1842);

Ambrose Fecit, or the *Peer and the Painter* (1864); *American Ballads* (1882); *Book of Battle Lyrics*; and *Jacob Schuyler's Millions* (1886). For a portrait of Dr. English, see frontispiece.

Eytinge, Harry, actor, born in Philadelphia, Pa., Oct. 30, 1822; died in Nyack, N. Y., Sept. 18, 1902. He made his first appearance in his twenty-first year. Having a great liking for the sea and belonging to a wealthy family, he had built a merchant vessel and commanded it on a voyage to Holland at the age of eighteen. His tastes were varied and his talents versatile; besides being a fine actor, he was an artist of much ability and a ship-builder, and he spoke several languages with perfect fluency. In the early days of his theatrical life he played with Junius Brutus Booth, Edwin Forrest, Charlotte Cushman, Edwin Booth, and other famous actors. He appeared at times in both tragedy and comedy, and managed many different theaters and companies in various cities of the United States. He played important rôles in all the Shakespearian dramas in the early days of his stage career, and in later years supported Margaret Mather for several seasons, besides other stars. He retired from public life in 1893. Mr. Eytinge was a highly cultivated man, of fine presence and distinguished manner, an accomplished actor, and a favorite both professionally and socially.

Feehan, Patrick Augustine, clergyman, born in Tipperary, Ireland, Aug. 29, 1829; died in Chicago, Ill., July 12, 1902. He was graduated at Maynooth College in 1852, and soon afterward came to the United States. He was ordained in the Roman Catholic Church in Illinois; appointed president of the Seminary of Carondelet; was pastor of the Church of the Immaculate Conception in St. Louis, and was consecrated Bishop of Nashville in 1865. In 1880 he was chosen first Archbishop of Chicago. During his administration he created 9 new parishes in Chicago; founded a college of the Christian Brothers, a convent and refuge of Sisters of the Good Shepherd, and 2 orphan asylums; and introduced into his diocese the Sisters of Mercy, the Sisters of Charity, and the Sisters of St. Joseph, all of whom he placed in charge of academies and parochial schools.

Fenger, Christian, surgeon, born in Copenhagen, Denmark, Nov. 3, 1840; died in Chicago, Ill., March 7, 1902. He was graduated at the University of Copenhagen with the degree of M. D. in 1864. He practised medicine in Copenhagen till the Franco-Prussian War broke out, when he became a surgeon in the Red Cross Ambulance Corps and served till the close of the war. He then lectured for a time in the University of Copenhagen; went to Egypt as a member of the Sanitary Council; and later was appointed surgeon of Khalifa Quarter, Cairo. In 1877 he removed to Chicago, where he resided until his death. In 1880 he became curator of Rush Medical College Museum, and in 1884 Professor of Clinical Surgery at the College of Physicians and Surgeons, going to the similar chair in Chicago Medical College in 1893, and in Rush Medical College in 1899. He was president of the Chicago Medical Society and vice-president of the American Association of Surgeons; and at different times was surgeon to the Cook County, Presbyterian, Tabitha, Norwegian, Passavant Memorial, Lutheran, German, and the German-American Hospitals. He contributed more than 80 papers on surgical subjects to American periodicals.

Fernald, Orlando Marcellus, educator, born about 1835. He was educated at Phillips Exeter Academy, and was instructor there several years.

He was graduated at Harvard University in 1864. In 1864-'65 he was principal of Exeter High School; and then became classical master of the Springfield High School. In 1872 he became Professor of Greek at Williams College, where he remained until his death. He edited Selections from the Greek Historians.

Ferris, Andrew Curtis, inventor, born in Mamaroneck, N. Y., about 1818; died in the Catskill mountains, New York, Aug. 1, 1902. In 1849 he went to the California gold-diggings in command of 200 armed men. He was the first to refine petroleum so that it could be burned as an illuminant without smoke.

Floyd-Jones, De Lancey, military officer, born in Queens County, New York, Jan. 20, 1826; died in New York city, Jan. 19, 1902. He was graduated at West Point and commissioned a 2d lieutenant in the 7th Infantry July 1, 1846; brevetted 1st lieutenant, Jan. 1, 1848; promoted captain, July 31, 1854; major of the 11th Infantry, May 14, 1861; brevetted lieutenant-colonel, Aug. 1, 1863; colonel, June 25, 1867; and was retired at his own request, March 20, 1879. He served with distinction through the Mexican War, taking part in the siege of Vera Cruz, in the capture of the city of Mexico, and in the battles of Cerro Gordo and Molino del Rey. After the war he was on frontier duty and in expeditions against hostile Indians till the civil war broke out, when, as major of the 11th Infantry, he served in the battles of Yorktown, Gaines's Mill, and Malvern Hill. He was also engaged in the battles of Manassas, Antietam, Chancellorsville, and Gettysburg. At the close of the war he was again assigned to service against the Indians. After his retirement he devoted much of his time to literature. He was the author of Letters from the Far West.

Ford, Paul Leicester, author, born in Brooklyn, N. Y., in 1865; died in New York city, May 8, 1902. At about the age of eight he met with an accident that injured his spine and dwarfed his physical growth. But he had a naturally brilliant mind, which was developed by a love of study and lifelong command of books and leisure. He was educated by private tutors in the house of his father, Gordon L. Ford, which contained one of the finest private libraries in the metropolis. He was a skilled bibliographer, and made the catalogue of the fine library that James Lorimer Graham bequeathed to the Century Association. Mr. Ford edited Thomas Jefferson's writings (10 volumes), John Dickinson's writings (3 volumes), and other works relating to American history, and wrote *The True George Washington* and *The Many-Sided Franklin*. In fiction he produced *The Honorable Peter Stirling*, *The Great K. & A. Train-Robbery*, *The Story of an Untold Love*, *Tattle-Tales of Cupid*, *Wanted—a Match-Maker*, *Wanted—a Chaperone*, and *Janice Meredith*. The last-named, a story of the time of the Revolution, had a remarkable success, the sale reaching the hundreds of thousands. Mr. Ford married, in 1900, Miss Mary Grace Kidder, of Brooklyn, and built a beautiful home in New York. He had inherited wealth from his father and had received large returns from the sale of his books. One of his brothers, who had been disinherited because of his devotion to athletics, brooded over what he considered the injustice done him, until he became undoubtedly a monomaniac if not completely insane. In this condition he visited Paul in his library and demanded a large sum of money; when this was refused, or when it appeared that Paul would refuse, he shot Paul through the breast, and

then shot himself, dying instantly. Paul died in half an hour. For portrait, see frontispiece.

Foster, Rebecca S. (popularly known as the "Tombs Angel"), benefactor, born about 1842; died in New York city, Feb. 21, 1902. In 1865 she married Gen. John A. Foster, who died in 1890, and after his death she undertook the humane work in the Tombs (the city prison in New York) that earned for her the title of the "Tombs Angel." She worked wholly on independent lines, representing no church, society, or organization, and rendered the prisoners under her care incalculable benefits, especially the women. She was greatly esteemed by the judges, lawyers, reporters, and all others who had business in the Criminal Courts building. Mrs. Foster was one of the victims of the Park Avenue Hotel disaster.

Fowler, Joseph Smith, lawyer, born in Steubenville, Ohio, Aug. 31, 1820; died in Washington, D. C., April 1, 1902. He was graduated at Franklin College, Ohio, in 1843, and was for four years Professor of Mathematics there. He then removed to Kentucky, where he was admitted to the bar, and later to Tennessee, where he practised until the civil war broke out, when he removed to Springfield, Ill., in consequence of Jefferson Davis's proclamation ordering all supporters of the Union to leave the Southern States. In 1862 he returned to Tennessee; was made Comptroller of the State; took an active part in reconstructing the State government in the interest of the Union; was elected United States Senator in 1865, but was not admitted to his seat till July, 1866; and was one of the 7 Republicans who voted against the impeachment of President Johnson. He practised in Washington, D. C., from 1871 till his death.

Frémont, Jessie Benton, author, born in Virginia in 1824; died in Los Angeles, Cal., Dec. 27, 1902. She was the daughter of United States Senator Thomas H. Benton, of Missouri. She removed to Washington at the age of fourteen and was educated at Georgetown Seminary. In Washington she became acquainted with John Charles Frémont, a lieutenant in the corps of topographical engineers. She was then about fifteen years old, and her parents objected to her receiving the addresses of the young lieutenant, and when the latter was assigned to a Government survey of Des Moines river, the young lovers believed that Senator Benton had obtained the order for the purpose of separating them. The survey was executed rapidly, and on Frémont's return the couple eloped and were married, Oct. 19, 1841. After a reconciliation with her parents, Mrs. Frémont returned to her father's home, where she remained while her husband was on one of his famous expeditions to explore the Rocky mountains. They removed to California a few years later, and returned to Washington in 1850, when Mr. Frémont was elected to represent California in the Senate. From the close of his senatorial term till his unsuccessful presidential campaign against James Buchanan, in 1856, they resided in St. Louis. After Gen. Frémont's death (1890) Mrs. Frémont wrote much for the newspapers and magazines. She was the author of *The Story of the Guard*; *A Year of American Travel*; *Far West Sketches*; *Souvenirs of My Time*; *Sketch of Senator Benton*; and *The Will and The Way Stories*.

French, Thomas Henry, publisher of plays and theater manager, born in New York city, Dec. 7, 1848; died there Dec. 1, 1902. He was educated in the United States and in France, and in 1870 he became a partner in the play-pub-

ishing business of his father, the firm being known as Samuel French & Son. In 1871 the elder French opened a branch house in London, leaving his son at the head of the New York office. The first play of great importance that the firm published in this country was *A Celebrated Case*, which was rented to the manager of the Union Square Theater at a royalty of 50 per cent. This venture proving very profitable, Mr. French set about securing American rights to other successful foreign plays, and in the course of a few years the firm published in the United States scores of the best European dramas that have been seen in this country. Mr. French's managerial experience began in 1873, when he produced *White Lies*, a dramatization of Wilkie Collins's novel of that name, at the old Olympic Theater, New York. In 1877 he undertook the management of Mr. and Mrs. J. C. Williamson, in *Struck Oil*, which was highly successful. In 1878 he took the entire Union Square Theater Company on tour, playing the Sardou drama *Mother and Son*, which had made a great hit in New York. In 1883 he took the Wallack's Theater Company to San Francisco with *The Silver King*. In 1889 Mr. French produced *Little Lord Fauntleroy*, which made a tremendous hit, and, in company with Frank Sanger, he soon had four companies playing this piece in different parts of the country. In 1892 Mr. French formed the Lillian Russell Opera Company, and it was regarded as the finest light-opera organization that ever had been seen in the United States. At different times he managed the Broadway Theater, the Madison Square Garden, and the Grand Opera-House, and he built and managed the new American Theater in West Forty-second Street, New York. The last dramatic production under his direction was the *Hotel Topsy Turvy*, at the Herald Square Theater in 1898.

Fries, Wulf Christian Julius, violoncellist, born in Germany, 1825; died in Roxbury, Mass., April 29, 1902. He began his musical career as a member of the orchestra in the theater of Bergen. He came to the United States with Ole Bull, and played the violoncello in the Ole Bull Concert Company in its tours throughout the country. He appeared also in concerts with Rubinstein, the pianist; and after he had settled permanently in the United States he founded the Mendelssohn Quintet Club, of Boston.

Frost, William Henry, author, born in North Providence, R. I., March 18, 1863; died in New York city, March 21, 1902. He was graduated at Brown University in 1886, and became connected with the New York Tribune as a general reporter in 1887, and as dramatic news reporter in 1889. He was the author of *The Wagner Story-Book* (1894); *The Court of King Arthur* (1896); *The Knights of the Round Table* (1897); and *Fairies and Folk of Ireland* (1900).

Frothingham, Ellen, translator, born in Boston, Mass., March 25, 1835; died there, March 11, 1902. She was a daughter of the Rev. Nathaniel Frothingham. She inherited the literary tastes of her father, and early turned her attention to German literature, her first published work being a translation of Lessing's *Nathan der Weise* (1868), usually considered the finest English version of Lessing's great drama. This was followed by translations of Goethe's *Hermann und Dorothea* (1870); *Lessing's Laokoon* (1874); *Grillparzer's Sappho* (1876); and from *Marie-Herbert, Poems of Therese* (1899).

Gallaudet, Thomas, clergyman, born in Hartford, Conn., June 3, 1822; died in New York

city, Aug. 17, 1902. He was a son of the Rev. Thomas Hopkins Gallaudet, who introduced into the United States the systematic education of deaf-mutes, and brother of Edward Miner Gallaudet, through whose instrumentality the National Deaf-Mute College in Washington, D.C., was established, of which he became president. He was graduated at Trinity College in 1842; taught in the New York Institution for the Deaf and Dumb in 1843-'58; and in the meantime was ordained in the Protestant Episcopal Church. In 1852 he founded St. Ann's Church for Deaf-Mutes, services being held in a room in the old building of the New York University, and later in the hall of the New York Historical Society till 1858, when a church and a rectory were secured on Eighteenth Street, near Fifth Avenue; and in 1864 this church was consolidated with St. Matthew's Church. In 1892 he resigned his active pastorate to enter into broader missionary work, and became pastor emeritus. Besides his other duties he accepted the pastorate of the Sisterhood of the Good Shepherd in 1869, and the chaplaincy of the Midnight Mission in 1871. He founded the Church Mission for Deaf-Mutes in 1872, and was its manager till his death. This society was the pioneer of church work among deaf-mutes throughout the country and has established the Gallaudet Home for Aged and Infirm Deaf-Mutes.

Gardiner, Charles Randolph, theatrical manager and agent, died in Millford, Del., Jan. 1, 1902. He opened the first theatrical booking agency in New York city, and managed it successfully for many years, introducing to the public numerous players who are now well known. He was the originator of various forms of theatrical amusement, the most profitable of which was musical farce-comedy, his own play, *The Tragedians of Kalamazoo*, being the first entertainment of this kind seen on the stage. He was the first to introduce music and specialties in *Uncle Tom's Cabin*, and he also organized the first regular company of traveling variety performers. Probably the most notable of Mr. Gardiner's theatrical achievements was the building of the first theater in Chicago after the great fire of 1871. He went to that city very soon after the calamity, and found many thousands of people with no place of amusement. He announced that he would have a new theater ready in one month, and in thirty-three days an attractive playhouse, 70 x 100 feet in dimensions, completely finished and handsomely furnished, was built and opened to the public, Lawrence Barrett giving the first performance. A few years ago Mr. Gardiner retired from theatrical life, and he was at the head of a large mercantile business in Millford up to the time of his death.

Garrard, Theophilus Toulmin, military officer, born in Manchester, Ky., June 7, 1812; died there March 14, 1902. He was a member of the Kentucky Legislature in 1843-'44, served in the Mexican War as captain of the 16th United

States Infantry, and on the discovery of gold went to California in 1849. He was elected a member of the State Senate in 1857 and in 1861, and at the outbreak of the civil war entered the National service as colonel of the 3d Kentucky Infantry. He was promoted brigadier-general in March, 1864, and was mustered out of the service April 4 following. After the war he engaged in farming and the manufacture of salt.

Gibbs, James Ethan Allen, inventor, born in Raphine, Va.; died there, Nov. 25, 1902. He lived in the South till the civil war broke out, when he settled in New York city, where, with Charles H. Willcox, he formed the firm of Willcox & Gibbs, manufacturers of the sewing-machine bearing its name. He invented the controlling principle of the single and double thread in sewing-machines, and other devices. He returned to his native town in 1892, where he did much to develop the industrial life there and in the Shenandoah valley.

Godkin, Edwin Lawrence, journalist, born in Moyne, Ireland, Oct. 2, 1831; died in Brixham, England, May 20, 1902. He was graduated at Queen's College, Belfast, in 1851, and was a war correspondent for the London News in Russia and Turkey during the Crimean War in 1854-'56. After the war he came to the United States; settled in New York city; studied law, and in 1859 was admitted to the bar. He was on the editorial staff of the New York Times in 1862-'65, and during that period again served the London News as correspondent in the civil war. In 1865 he established and became editor of the Nation, which was made the weekly issue of the Evening Post in 1881, and he then became one of the editors and proprietors of the joint publication, and remained as such till 1898, when he retired. In 1895 Mayor Strong appointed him a member of the Civil-Service Commission, on which he served till Mayor Van Wyck's election. He was the author of a History of Hungary; Reflections and Comments; Problems of Democracy; and Unforeseen Tendencies of Democracy.

Goshorn, Alfred Traber, manufacturer, born in Cincinnati, Ohio, in 1834; died there, Feb. 19, 1902. He was graduated at Marietta College in 1854, and two years later was admitted to the bar, and began practise in Cincinnati. On becoming proprietor of an extensive white-lead plant in Cincinnati he retired from his profession to engage in manufacturing. In 1870 he became president of the Cincinnati Industrial Exhibition, which proved so successful that it has since been repeated annually. His administrative abilities in this field led to his appointment as director-general of the Centennial Exposition at Philadelphia in 1876. Mr. Goshorn was one of the organizers in 1881 of the Cincinnati Museum Association, and till his death was its director.

Goucher, Mary C., philanthropist, died in Alto Dale, Md., Dec. 19, 1902. She was the daughter of Dr. John Fisher. In early life she became interested in educational and church work, and was conspicuous as an advocate of the education of women. She married the Rev. John F. Goucher, inherited a fortune of more than \$1,000,000, and applied much of her time and money in assisting her husband in establishing the Woman's College of Baltimore, which through her aid has become one of the most important educational institutions under the auspices of the Methodist Episcopal Church. She, with her husband, established nearly 100 Methodist mission schools in India.

Grant, Julia Dent, born on her father's farm in Whitehaven, 10 miles southeast of St. Louis, Feb. 16, 1826; died in Washington, D. C., Dec. 14,

1902. Her father was Judge Dent, a practitioner at the St. Louis bar. Julia was the fifth child and the oldest daughter. She received her education in St. Louis. Her brother was a classmate of

Ulysses S. Grant, who saved his (Dent's) life while fighting in the Mexican War. Grant married her Aug. 22, 1848, at the Dent residence. The young officer was then assigned to Sackett's Harbor, N. Y., and six months later was transferred to Detroit. Mrs. Grant accompanied him to both places. In 1854 Capt. Grant resigned from the army, when his father-in-law gave him a 65-acre farm. The couple were unable to get a living out of it, however, and Grant found employment in a real-estate office in St. Louis. In the spring of 1860 he went to work in his father's leather store in Galena, Ill. At the close of the civil war Grant was made commanding general of the army, and, with Mrs. Grant, settled in Washington. After this came his election to the presidency, and Mrs. Grant became the mistress of the White House, where she presided with dignity and tact. The eight years' régime of the Grants at the White House was characterized by social functions of great elegance. Subsequently they made a trip around the world. Some of the greatest honors ever shown to an American woman were showered on Mrs. Grant, and she and her husband received many rare and costly gifts. After the death of her husband Mrs. Grant's life was remarkably quiet, much of it being spent in Washington. The most noticeable incident in the latter part of her life was her decision in regard to \$150,000 borrowed by her husband from William H. Vanderbilt. This was in 1884, three days before the failure of the firm of Grant & Ward in May. Gen. Grant believed the loan could be returned by him in a day or two, but his affairs changed radically in a very short time, and when Mr. Vanderbilt demanded payment he was unable to make it. Mr. Vanderbilt began a suit, and Gen. Grant permitted judgment to be entered against him. He and Mrs. Grant, however, sent to Mr. Vanderbilt the deeds of their property, which they believed was sufficient to cover the debt of honor. Mr. Vanderbilt thereupon wrote to Mrs. Grant, presenting to her, as her separate estate, the debt and judgment he held against Gen. Grant's real estate and the household furniture and ornaments. In reply Mrs. Grant declined the proposition, excepting the trust that applied to articles to go to the Government. Gen. Grant acquiesced in the plan after it was modified considerably, but Mrs. Grant, after first agreeing with him, withdrew her consent. During Gen. Grant's last illness she was his constant attendant. After her husband's death Congress voted her a life pension of \$5,000 per annum. In accordance with an agreement concerning the permanent resting-place of Gen. Grant's remains, those of his widow were laid beside his own in a sarcophagus of the mausoleum in Riverside Park, New York city.

Gray, Ada (Mrs. Charles F. Tingay), actress, born in Oneonta, N. Y., in 1834; died in Fordham, N. Y., Aug. 27, 1902. She made her first appearance when she was only ten years old, and at fifteen she played Juliet in Rochester, N. Y.

A little later she became a member of the Boston Museum Company, appearing chiefly in spectacular and Shakespearian plays. After this she traveled through New England, and then became leading lady of a stock company in St. Louis, Mo. While occupying this place she played in support of Edwin Forrest, Edwin Booth, and other noted actors. After a few seasons in the St. Louis company she appeared in New Orleans, starring in *Lucrezia Borgia*, and was very successful. In 1855 Miss Gray obtained the play called *East Lynne*, a dramatization of Mrs. Henry Wood's once popular novel, and appeared in the rôle of Lady Isabel, in which she scored a tremendous success, and played it exclusively thereafter for twenty years. According to her own reckoning, she acted this rôle, in the United States and in England, about 5,000 times. In 1872 Miss Gray married Charles A. Watkins, of Albany, N. Y., and after his death, in 1891, she married (1894) Charles F. Tingay, an English actor belonging to Henry Irving's Lyceum Theater Company, of London, England.

Gray, Horace, jurist, born in Boston, Mass., March 24, 1828; died in Nahant, Mass., Sept. 15, 1902. He was graduated at Harvard University in 1845, and at Harvard Law School in 1849, was admitted to the Massachusetts bar in 1851, and practised in that State till 1854, when he was appointed reporter of the Supreme Court of Massachusetts. In 1864 he was appointed an associate justice of the Supreme Court of Massachusetts, and in 1873 became chief justice. He held the latter post till 1882, when he was appointed an associate justice of the Supreme Court of the United States, from which post he retired a few weeks before his death.

Green, Francis Mathews, naval officer, born in Boston, Mass., Feb. 23, 1835; died in Albany, N. Y., Dec. 19, 1902. He was educated in Boston, and after a short business life he became a seaman. In 1861 he was appointed acting master in the volunteer navy. He was promoted to acting volunteer lieutenant, April 21, 1864; transferred to the regular navy and commissioned lieutenant-commander, Dec. 18, 1868, and commander July 7, 1883; and was retired Feb. 23, 1897. At the beginning of the civil war he was attached to the sloop *Vincennes* of the Western Gulf blockading squadron; later he served in the North Atlantic and Gulf blockading squadrons, at times in command of steamers on special service. He commanded the steamer *Boxer* at the capture of Fort Fisher, and also took part in severe fighting elsewhere. From 1873 to 1883 he was connected with five expeditions for determining exact latitudes and longitudes in various parts of the world; and from that time till his retirement he served in navy yards, as commander of the Pennsylvania school-ship *Saratoga*, and as inspector of lighthouses along the coasts of Massachusetts. Commander Green was author of *The Navigator of the Caribbean Sea* (1877); *Telegraphic Determination of Longitudes* (1876, 1880, 1883); and *List of Geographical Positions* (1883).

Griffin, Simon Goddell, military officer, born in Nelson, N. H., Aug. 9, 1824; died in Keene, N. H., Jan. 14, 1902. He was a teacher for several years; was admitted to the bar in 1860, and began practise in Concord. When the civil war broke out he entered the National service as captain in the 2d New Hampshire Regiment, with which he took part in the first battle of Bull Run. He was promoted lieutenant-colonel in October, 1861, and transferred to the 6th Regiment, of which he became colonel in April following. He took part in

the battles of Manassas, Antietam, and Fredericksburg; was placed in command of the 1st Brigade, 2d Division of the 9th Army Corps, in 1863, and served under Gen. Grant in his operations against Vicksburg, and under Gen. Sherman in his Mississippi campaign. Later he was placed in command of the 2d Brigade, 2d Division, and commanded it in the battles of the Wilderness and Spottsylvania. In 1864, on Gen. Grant's recommendation, he was promoted brigadier-general, and in 1865 was brevetted major-general for gallant conduct at the assault on Fort Stedman. After the war he was offered a commission in the regular army, which he declined. He settled in Keene, N. H., and served five years in the State Legislature, being for two years Speaker of the House.

Grissom, Eugene, alienist, born in Granville, N. C.; died in Washington, D. C., July 27, 1902. He served in the Confederate army in the civil war till he was wounded, and was afterward a member of the North Carolina Legislature. For twenty-one years he was superintendent of the North Carolina Insane Asylum. He gained a wide reputation as an alienist and lecturer. His lecture on *The Borderland of Insanity*, delivered before the American Medical Society, attracted considerable attention. Dr. Grissom was the first vice-president of the American Medical Society, several times presiding officer of the Association of Superintendents of American Insane Asylums, and author of *True and False Experts*.

Guernsey, Alfred Hudson, editor, born in Brandon, Vt., May 12, 1818; died in New York city, Jan. 17, 1902. He was educated at Oneida Institute, where he also learned typesetting, and later at Union Theological Seminary. Subsequently he was employed by Messrs. Harper & Brothers, first as corrector of the press, and afterward as one of the literary advisers. When Harper's Magazine was established, he was assigned to the editorial staff, where he remained for twenty years, during which time he contributed numerous articles to the magazine and conducted the department of *Monthly Record of Current Events*. In 1883 he became an associate editor of the *American Cyclopædia*, to which he contributed many historical and biographical articles relating to the civil war, and later he was editor of *Alden's Cyclopædia of Universal Literature*. With Henry M. Alden he compiled Harper's *Pictorial History of the Great Rebellion* (1863-'67). His writings in book form include *The Spanish Armada*; *Thomas Carlyle: His Theories and Opinions*; *Ralph Waldo Emerson, Philosopher and Poet*; and *The World's Opportunities and How to Use Them*.

Ham, Charles Henry, lawyer, born in Canterbury, N. H., in January, 1831; died in Pater-son, N. J., Oct. 16, 1902. He was a clerk in a store in Loudon, and later (1852-'56) in the Concord Railroad office in Concord, N. H., and while thus employed he studied law. In 1856 he removed to Chicago, where he entered the banking-house of R. K. Swift & Co., and was admitted to the bar in 1860. In 1871 President Grant appointed him appraiser of the port of Chicago, where he remained till 1886; and in 1889 President Harrison appointed him a member of the Board of General Appraisers, which office he held till June, 1901. He advocated the School of Manual Training in Chicago, and labored earnestly for many years as a speaker, lecturer, and author for reform in public-school education. He was a writer on the *Chicago Tribune* and the *Inter-Ocean* and was author of *Ten-Minute Sketches* and of books on manual training.

Hampton, Wade, military officer, born in Charleston, S. C., March 28, 1818; died in Columbia, S. C., April 11, 1902. He came of a family of military men bearing the Christian name of Wade. His father was a lieutenant of United

States dragoons in 1813 and an aid to Gen. Jackson in 1815. His grandfather was an officer in the Revolutionary War and major-general in 1813, and one of his sons was a Confederate officer, killed in battle near City Point, Va., in 1864. He was

graduated at the University of South Carolina, and studied law, but never practised. His early life was devoted almost exclusively to the management of his large plantations in South Carolina and Mississippi. He served in both branches of the State Legislature, where he gave expression to political views of a national Democratic rather than a secession tendency, and such were not then popular in his State. At the outbreak of the civil war he enlisted as a private in the Confederate army, but soon raised a command of infantry, cavalry, and artillery, which became widely known as the Hampton Legion, and won distinction in the early part of the war, a record repeated in the Peninsular campaign, and especially at Seven Pines, where the command lost half of its number and its leader was wounded. Soon afterward Hampton was commissioned a brigadier-general of cavalry. He was actively engaged in the Maryland and Pennsylvania campaigns in 1862-'63; distinguished himself at Gettysburg, was promoted major-general, Aug. 3, 1863; and in 1864, after several days' fighting, checked Sheridan at Trevillian's Station. In September following he was made commander of Lee's cavalry, with the rank of lieutenant-general; and later of Gen. Johnston's. After the war he engaged in cotton-planting. He was Governor of South Carolina in 1877-'79; United States Senator in 1879-'91; and United States Commissioner of Pacific Railroads in 1893-'97, when he was succeeded by Gen. James Longstreet.

Hanchett, David, actor, born in Montgomery County, New York, in 1823; died in Brooklyn, N. Y., April 20, 1902. As a youth he showed decided preference and talent for the stage, and in 1845 he founded the old Shakespearean Association, giving many performances in Gothic Hall, Broadway, New York. After playing a variety of roles with this company of amateurs for one year, he joined a professional company in 1846, traveling with it in the South. He kept on the road eight seasons, gradually advancing in his art, and winning friends and admirers wherever he appeared. In 1854 he returned to New York as leading man in the old Broadway Theater, on the site where Daly's Theater now stands. He played there one year, and in 1855 he went to Boston, where he made some of the most distinguished successes of his career. For one season he played leading roles at Howard Athenaeum, then under the management of Edward L. Davenport. The next season he appeared at the National Theater, with William B. English as manager. Here he acted with the popular Western Sisters—Lucilla and

Helen—in their whole repertoire, and became as great a favorite in Boston as he had been in New York. In the height of his popularity Mr. Hanchett played very often with Charlotte Cushman, making several tours of the United States with her. He also acted frequently in support of Julia Dean and of Edwin Booth. In earlier years he had been associated with Junius Brutus Booth, a fact of which he was very proud. He married Emma Warren, sister of William Warren, the leading actor of the old Boston Museum company. In his later years Mr. Hanchett retired from the stage, and devoted much of his time to teaching elocution and dramatic art.

Harkins, Daniel H., actor, born in Boston, April 27, 1836; died in New York, Dec. 7, 1902. He made his first appearance at Rice's Theater, Chicago, in 1853. In 1854 he played in the stock company at the Walnut Street Theater, Philadelphia, where he supported Edwin Forrest and many other celebrated actors. He went to New York in the following year, and became a member of Laura Keane's company. At the outbreak of the civil war he was playing at Niblo's Garden, N. Y., but he organized a company of cavalry and served through the war, being at different times on the staffs of Gen. Slocum, Hunter, and Sullivan, and receiving after a time an appointment as major of a New York regiment. After the war he returned to the stage, and in 1866 he appeared in the support of James K. Hackett, after which he joined Augustin Daly's company, in which he played leading roles for many seasons. After leaving Daly's Theater Mr. Harkins organized a dramatic company of his own, and with it made a tour of the world, playing Shakespearean and modern dramas in nearly every English-speaking country. When this tour ended he settled in San Francisco, and for several years appeared in classic roles at the California Theater. In 1887 he joined Richard Mansfield's company, remaining with that organization nine seasons. During his later years he was interested in fruit-farming and owned a fine farm at White Plains, N. Y. He made his last appearance, April 14, 1902, at Wallack's Theater, New York city, on the first night of the production of *The Last Appeal*, when he became ill and was unable to continue playing. Mr. Harkins had a fine presence and a melodious voice, and a genial nature that won him many friends.

Harrison, Gabriel, actor, artist, and author, born in Philadelphia, March 25, 1818; died in Brooklyn, N. Y., Dec. 15, 1902. When he was six years old his family removed to New York, and their house was often visited by well-known literary, theatrical, and other notable people. Aaron Burr was among these, and young Harrison became a favorite with the former Vice-President, who taught him to read. When he reached early manhood he desired ardently to become an actor, and after some stage experience in amateur societies he joined, in 1838, the National Theater Company, in New York, under the management of James W. Wallack, playing Othello to Mr. Wallack's Iago. Later he appeared in the support of Edwin Forrest and of Charles Kean. In 1851 he organized the Academy of Art, in Brooklyn, and in 1853 he opened the Park Theater in that city. He became a member of the Brooklyn Academy of Design in 1877, and for several years was its secretary. When the Long Island Historical Society was organized (in 1864), Mr. Harrison presented to it a library of dramatic works, comprising nearly 1,000 volumes, several valuable manuscripts, and the wedding-ring of Edgar Allan Poe, which had been given to him by a

member of the poet's family. He was one of the founders of the Faust Club, and organized the movement for placing in Prospect Park a bust of John Howard Payne, who was his lifelong friend. Mr. Harrison was one of the first in this country to produce the portraits known as daguerreotypes. He achieved considerable distinction as a landscape artist, and won prizes at the Crystal Palace in London and at the World's Fair in New York. His writings were chiefly dramatic, including a dramatization of Hawthorne's *Scarlet Letter* and adaptations of Schiller's plays. He also wrote a biography of John Howard Payne. In his later years he was a successful teacher of elocution and dramatic action. He painted a portrait of Poe from a daguerreotype that he himself had taken, and presented it to the Authors Club of New York.

Harte, Bret, author, born in Albany, N. Y., Aug. 25, 1839; died in Camberley, England, May 6, 1902. His Christian name originally was Francis Bret, but he dropped the name Francis about 1870. His father was a teacher in Albany Female Seminary. Bret received a common-school education, and at the age of fifteen went to California with his widowed mother. He walked from San Francisco more than a hundred miles to Sonora, then a great gold-mining center, and opened a school. In this he was unsuccessful, and he then became a miner, still without success. He next became a compositor in a printing-office, contributed to the paper, and set some of his articles directly in type, without manuscript. For a time, when the editor was absent, he conducted the journal; but his editing did not please the subscribers, and he was obliged to withdraw from the establishment. He returned to San Francisco, became a compositor in the office of the *Golden Era* in 1857, contributed sketches to the paper (at first anonymously), and after a time became a member of the editorial staff. Later he was associated in the establishment of *The Californian*, a short-lived literary weekly, to which he contributed his *Condensed Novels*. From 1864 to 1870 he was secretary of the United States mint in San Francisco, and in those years he wrote several poems (some humorous and others serious) that attracted attention and were widely copied. The most successful of these were *The Society upon the Stanislaus* and *John Burns of Gettysburg*. In 1868 he became editor of the new magazine the *Overland Monthly*. It is said that when the artist had drawn a picture of a grizzly bear for the cover design, Harte drew two straight marks under it, representing the track of the new railroad, on which the bear appeared to be looking at an approaching train, thus greatly increasing the artistic suggestiveness. In the number for August of that year he published *The Luck of Roaring Camp*, which at once gave him a high reputation as a story-writer, and in the September number *The Outcasts of Poker Flat*. These two are recognized as ranking with the very best short stories in the language—or in any language. Harte created a dialect, attributed to the mining-camps, which had no existence except in his pages. Other short stories of California life followed in quick succession. In September, 1870, he published his satirical poem entitled *Plain Language from Truthful James*, commonly known as *The Heathen Chinee*, which was copied and repeated everywhere. He was appointed Professor of Recent Literature in the University of California in 1870, but the next spring he resigned that chair and removed to New York. He entered into a contract with the Boston house of James R. Osgood & Co. by which

he contributed exclusively to the *Atlantic Monthly*, and that firm published all his books, bringing out at once collected editions of his poems and short stories. He appeared on the platform with a lecture on *The Argonauts of '49*, but he was no orator. He was appointed United States consul at Crefeld, Germany, in 1878, and was transferred to Glasgow, Scotland, in 1880. This office he held till 1885, when on the incoming of a new administration he was removed. Thenceforth he made his home in London. His publications in book form are *Condensed Novels* (1867); *Poems* (1871); *The Luck of Roaring Camp, and Other Sketches* (1871); *East and West Poems* (1871); *Mrs. Skaggs's Husbands* (1872); *Tales of the Argonauts, and other Stories* (1875); *Thankful Blossom* (1876); *Two Men of Sandy Bar* (1876); *Gabriel Conroy* (1876); *The Story of a Mine* (1877); *Drift from Two Shores* (1878); *Echoes of the Foothills* (1879); *The Twins of Table Mountain* (1879); *Flip and Found at Blazing Star* (1882); *In the Carquinez Woods* (1883); *On the Frontier* (1884); *By Shore and Ledge* (1885); *Maruja, a novel* (1885); *Snow-Bound at Eagle's* (1886); *A Millionaire of Rough and Ready* (1887); *The Crusade of the Excelsior* (1887); *Cressy* (1887); *The Heritage of Dedlow Marsh* (1888); *A Ward of the Golden Gate* (1888); *A Sappho of Green Springs* (1889); *Colonel Starbottle's Client* (1889); *A First Family of Tassajara* (1890); *Susy* (1890); *Sally Dows, and Other Stories* (1891); *The Protégée of Jack Hamlin's, and Other Stories* (1891); *The Bell-Ringers of Angel's, and Other Stories* (1892); *Clarence* (1892); *In a Hollow of the Hills* (1893); *Barker's Luck, and Other Stories* (1893); *Three Partners* (1894); *Tales of Trail and Town* (1894); *Stories of Light and Shadow* (1895); *Mr. Jack Hamlin's Meditation, and Other Stories* (1896); *From Sand-Hill to Pine* (1897); *Under the Redwoods* (1898); and *Openings in the Old Trail* (1900). For portrait, see frontispiece.

Hartley, Marcellus, manufacturer, born in New York city, Sept. 28, 1828; died there, Jan. 8, 1902. After completing his education he entered a counting-room, and in 1854 he established the firm of Schuyler, Hartley & Graham, which in 1898 became the M. Hartley Company. This house during the civil war did a large business in supplying the Government with arms, and Mr. Hartley was appointed by the Secretary of War to take charge of an important service. He was commissioned a brigadier-general of volunteers, and was authorized to buy all the guns in the European market, to prevent, if possible, the Confederates from securing them. He was a director in several financial corporations, a member of a number of scientific societies, and was closely identified with many charitable institutions, especially with Hartley House, erected by the New York Association for the Improvement of the Poor.

Hastings, William Granville, sculptor, born in England about 1868; died in Mount Vernon, N. Y., June 13, 1902. He was educated at Dulwich College, studied art in London and Paris, and in 1885 began the study of sculpture and art pottery. In 1889 he went to Paris, where he was engaged in ecclesiastical figure work. He came to the United States in 1891, and executed considerable work, including a series of bas-reliefs illustrating the history of the phonograph for the Edison Company, the *Soldiers and Sailors Monument* at Pawtucket, R. I., the *Soldiers and Sailors Monument* at Orange, N. J., and the *Lincoln Monument* at Cincinnati, Ohio.

Helmuth, William Tod, physician, born in Philadelphia, Pa., Oct. 30, 1833; died in New York city, May 15, 1902. He was graduated at the Homeopathic Medical College, Philadelphia, in 1853; became Professor of Anatomy there in 1855; and during the interval wrote *Surgery and its Adaptation to Homeopathic Practise*. In 1858 he began practise in St. Louis, Mo., and in the following year organized the College of Homeopathic Physicians and Surgeons there, and was made its dean and Professor of Surgery. In 1867 he was president of the American Institute of Homeopaths; the following year he spent in Europe studying surgery; and in 1869 he was made Professor of Surgery in the New York Homeopathic Medical College and Hospital. Dr. Helmuth was one of the editors of the *North American Homeopathic Journal*, and was author of numerous works, including *A System of Surgery*, *Scratches of a Surgeon*, *Suprapubic Lithotomy*, and *With the Pousse Café*.

Hemphill, William Arnold, publisher, born in Athens, Ga., May 5, 1842; died in Atlanta, Ga., Aug. 17, 1902. He was graduated at the University of Georgia, where he received the degree of civil engineer; served in the Confederate army during the civil war, and was wounded at Gettysburg. He was mayor of Atlanta in 1891, and founded the Atlanta Constitution.

Hendrickson, John, merchant, born in Middletown, N. J., about 1832; died in New York city, June 29, 1902. He served in the civil war, first as a lieutenant in the 7th New York Regiment and later as colonel of the 9th Regiment. In the battle of Fredericksburg he lost his right leg, and at the close of the war he was brevetted brigadier-general of volunteers for gallant and meritorious services. In early life he was engaged in the silk business, later in the cotton trade, and after 1880 in the woolen trade.

Henry, John W., jurist, born in Cynthiana, Ky.; died in Kansas City, Mo., Dec. 12, 1902. He studied law at the Transylvania Law School, began practise in Booneville about 1840, and subsequently formed a partnership with J. Brown Hovey in Independence, Mo. In 1872 he was appointed a district judge to fill a vacancy, and afterward was twice elected to the office for full terms. In 1876 he was appointed a judge of the Supreme Court, on which bench he served till 1888, being Chief Justice in the two last years. On his retirement he settled in Independence. A year afterward he was appointed a judge of the circuit court, which was his last judicial office.

Hepworth, George Hughes, clergyman and journalist, born in Boston, Mass., Feb. 4, 1833; died in New York city, June 7, 1902. He was graduated at Harvard Divinity School in 1855. He was pastor of a Unitarian Church in Nantucket in 1855-'57, and in the following year organized a Unitarian Society in South Boston, which grew so rapidly that a church was built, known as the Church of the Unity. In 1862, while in charge of this church, he received leave of absence and entered the 47th Massachusetts Regiment as chaplain, and served throughout the Louisiana campaign. In 1863 he was transferred to the staff of Gen. Banks, and at the end of the year returned to his church, and soon afterward wrote an account of his army experiences under the title *Whip, Hoe, and Sword*. In 1870 he left this church, and soon afterward was called to the Church of the Messiah, New York city, where he remained two years, when he withdrew from the Unitarian Church and became pastor of the Madison Avenue Presbyterian Church, New York city. In 1880 he was sent to Ireland by the New

York Herald to distribute a relief fund to the famine sufferers. Since 1885 he had applied himself exclusively to journalism and literary work. In 1897 he was sent to Armenia as special correspondent of the Herald. Dr. Hepworth was author of *They Met in Heaven*; *The Life Beyond*; *The Farmer and the Lord*; *Starboard and Port*; *The Little Gentlemen in Green*; *Rocks and Shoals*; *Lectures to Young Men*; *Christ and His Church*; *Hiram Golf's Religion*; *Brown Studies*; and *On Horseback through Armenia*.

Herron, Francis Jay, military officer, born in Pittsburg, Pa., Feb. 17, 1837; died in New York city, Jan. 8, 1902. He was graduated at the Western University of Pennsylvania in 1854; and removed to Dubuque, Iowa, in 1856, where he became a merchant. When the civil war broke out he organized and commanded the Governor's Grays, in the 1st Iowa Regiment; was engaged in the battles of Booneville, Dug Springs, Ozark, and Wilson's Creek; was promoted lieutenant-colonel of the 9th Iowa Infantry in September, 1861; commanded it through the campaigns in Missouri, Arkansas, and Indian Territory; and later was promoted colonel of the regiment, and distinguished himself at the battle of Pea Ridge, where he was wounded and taken prisoner, but was soon exchanged. He was commissioned a brigadier-general of volunteers July 29, 1862, and commanded in the battle of Prairie Grove, Ark., for which he was promoted major-general of volunteers Nov. 9. Early in 1863 he joined Gen. Grant at Vicksburg, where he commanded the left wing of the National forces till the surrender of the city. He then commanded the expedition that captured Yazoo City and the large fleet of boats and supplies there. Later he was placed in command of the 13th Army Corps, on the Texas coast. While there he broke up the traffic across the Rio Grande, and, under private instructions from Washington, gave what aid he could to President Juarez of Mexico, and prevented Maximilian's troops from establishing themselves at any point on the Rio Grande frontier. For this service President Juarez offered him a high command in the Mexican army. In March, 1865, he was assigned to command the Northern Division of Louisiana, and in June he received the surrender of all the Confederate forces west of the Mississippi. In July he was appointed one of the commissioners to negotiate treaties with the Indian tribes. He resigned the latter commission together with that of major-general in August of the same year. In 1873 he removed to New York, where he practised law till his death.

Hirsch, Solomon, diplomatist, died in Portland, Ore., Dec. 15, 1902. He was a merchant in Portland, and well known in Oregon politics. While president of the State Senate, in 1885, he was nominated for the United States Senate. As the vote was a tie, he could have elected himself, but he cast his vote for his opponent. In 1889 he was appointed minister to Turkey.

Hoadly, George, jurist, born in New Haven, Conn., July 31, 1826; died in Watkins, N. Y., Aug. 27, 1902. He was graduated at Western Reserve College in 1844; studied at Harvard Law School, and was admitted to the bar in 1847. In 1849 he became a partner in the law firm of Chase & Ball; in 1851 was elected a judge of the Superior Court of Cincinnati; in 1855, city solicitor; and in 1858 succeeded Judge Gholson on the bench of the new Superior Court. He resigned his judgeship in 1866, and established a law firm of which he was the head. During the civil war he became a Republican, but in 1876 his opposi-

tion to a protective tariff led him to affiliate again with the Democratic party. He was one of the counsel that successfully opposed the project of a compulsory reading of the Bible in the public schools, and was the leading counsel for the assignee and creditors in the case of the late Archbishop Purcell. He was an active member of the constitutional convention of Ohio in 1873-'74; professor in Cincinnati Law School in 1884-'87; Governor of Ohio in 1883-'85; and a trustee of the University of Ohio for several years. He removed to New York city in 1887 and resumed practise.

Hobart, Harrison C., military officer, born in Ashburnham, Mass., about 1822; died in Milwaukee, Wis., Jan. 26, 1902. He was graduated at Dartmouth College in 1843, and removed to Wisconsin in 1846, where he began the practise of law. He was elected to the Territorial Legislature in 1847, and was the first State Senator from his district. He aided in framing the Constitution, and had a marked influence on much of the early legislation of the State. In the civil war he became a brigadier-general of volunteers; was captured by the Confederates and taken to Libby Prison; and was one of the men who constructed the famous tunnel through which they escaped. Gen. Hobart was the last survivor of the Wisconsin constitutional convention.

Hoffman, Eugene Augustus, Episcopal clergyman, born in New York city, March 21, 1829; died near Plattsburg, N. Y., June 17, 1902. He was educated at Rutgers College and Harvard University, and after studying in the General Theological Seminary in his native city, was ordered priest in 1853. He was rector of Christ Church, Elizabeth, N. J., 1853-'63; of St. Mary's Church, Burlington, N. J., 1863-'64; Grace Church, Brooklyn, N. Y., 1864-'69; and St. Mark's, Philadelphia, 1869-'79. In the year last named he was appointed dean of the General Theological Seminary, in which office he continued until his death. When he accepted the office of dean the seminary was hampered by insufficient endowment and equipment; he left it a flourishing institution housed in stately buildings ample for its needs for a long time to come. Dean Hoffman was many times a millionaire, the wealthiest clergyman in the United States, and not only was he liberal toward the institution under his charge, but his wise benefactions were extended in many other directions. He was actively interested in the work of historical, genealogical, scientific, and other societies. His writings include *Free Churches*; *The Ritualistic Week*; and *Manual of Devotion for Communicants*. Theologically he was classed among the more advanced churchmen, although not an extremist.

Holbrook, Martin Luther, hygienist, born in Mantua, Ohio, Feb. 3, 1831; died in New York city, Aug. 12, 1902. He was educated at Ohio University, and was associate editor of the *Ohio Farmer*, of Cleveland, in 1859-'61, when he became interested in medicine and hygiene, and went to Boston to study. He was associated with Dr. Dio Lewis in his propaganda of physical culture and hygiene, and the introduction of his system into the public schools. In 1864 he removed to New York and formed the partnership of Miller, Wood & Holbrook, publishers of medical books and the *Herald of Health*, of which paper Dr. Holbrook remained editor till 1898. He was the author of *Hygiene of the Brain and Cure of Nervousness*; *Eating for Strength*; *Parturition without Pain*; *Liver Complaint*; *Mental Dyspep-*

sia and Headache; *Chastity, Marriage, and Par- entage*; *Hygienic Treatment of Consumption*; *Stirpiculture*, etc.

Hooker, George W., banker, born in Salem, N. Y., in 1838; died in Brattleboro, Vt., Aug. 6, 1902. He was educated at West River Academy. At the outbreak of the civil war he enlisted as a private in the volunteer service, and soon afterward was made sergeant-major. He reached the rank of lieutenant-colonel in 1865, and received a medal of honor for gallantry at South Mountain. After the war he became associated with the banking firm of William Belden & Co., of New York, as junior partner; was elected to the State Legislature of Vermont in 1880, and by it was chosen judge-advocate general. In 1879 and 1880 he was elected department commander of the Grand Army of the Republic; and he was president of the Vermont Agricultural Society.

Hopkins, George Milton, inventor, born in Oakfield, N. Y., Nov. 21, 1842; died in Cheshire, Mass., Aug. 17, 1902. He early showed an aptitude for mechanics, and was placed in a workshop in Albion. In 1862 he obtained his first patent for an apparatus for turning leaves of music, after which followed many other inventions, among them an electromagnetic sewing-machine, two for telegraph relays, five on telephone transmitters, and two on telephone receivers. Later he became interested in the construction of gas-engines, and secured several patents in that line. In 1876 he became connected with the *Scientific American* as an attorney in the patent department. As one of the editors of that publication he had charge of the electricity department and also conducted the department of questions and answers. He was the author of *Experimental Science*, a handbook, and of many pamphlets on scientific subjects.

Hopkins, John, jurist, born in England, March 19, 1843; died in Millbury, Mass., May 19, 1902. He removed to the United States with his parents in infancy; was graduated at Dartmouth College in 1862; studied law, and was admitted to the bar in Massachusetts in 1864. He opened a law office in Millbury in 1864, and one in Worcester in 1878. He was a member of the State Senate in 1882-'83; and was a delegate to the National Democratic Convention in Chicago in 1884. From 1891 till his death he was a judge of the Superior Court of Massachusetts.

Horton, Albert H., jurist, born in Orange County, New York, March 13, 1837; died in Topeka, Kan., Sept. 1, 1902. He was educated at Farmer's Hall Academy and the University of Michigan; removed in 1860 to Kansas, where he practised law, served in the Legislature, and held several judicial offices. He was at one time United States attorney for the district of Kansas, and he was Chief Justice of Kansas from Jan. 1, 1877, to May 1, 1895, when he resigned.

Horton, David Philander, musician, born in Southold, Long Island, N. Y., in 1827; died there, April 1, 1902. He began his musical studies in 1845 under Prof. Edward Home, Jr. In 1856 he began musical work in the Brooklyn public schools, and he continued in that service till 1892, when he retired on account of failing health. He played in the Brooklyn Orphan Asylum, free of charge, for thirty-five years; taught sailors on board the United States training-ship *Minnesota* three years; gave lessons free to those too poor to pay; and was interested in singing classes all over Long Island. He composed many pieces of music; published several singing-books, including *Songs of the Nation* and *Naval Songs*; and set to music many of Fanny Crosby's hymns.

Howe, William F., lawyer, born in Boston, Mass., about 1828; died in Bronx Borough, New York city, Aug. 2, 1902. He was taken to England when three years old, and was educated at King's College, London. Returning to the United States in 1857, he was admitted to the bar in 1859, and passed his life in practise in New York city. In 1869 he formed the partnership of Howe & Hummel; and in 1882, with Daniel G. Rollins, codified the State laws as they now appear in the Penal Code. During his professional career he had charge of the defense in nearly 600 homicide cases. He was a skilful orator, and obtained many favorable verdicts by his eloquence.

Huesmann, George, pomologist, born about 1827; died in Napa, Cal., Nov. 6, 1902. He was a promoter of horticultural and viticultural interests, and for three years was Professor of Pomology and Forestry in the University of Missouri. He founded, with Parker Erie, the American Pomological Society. Prof. Huesmann was author of several books on viticulture and horticulture; publisher of *The Viticultural Journal*; and a contributor to many magazines.

Hull, Harmon D., financier, born in Fulton, N. Y.; died in New York city, June 6, 1902. He entered the National army in April, 1861; with Col. Abram Duryea organized the 5th New York Volunteers, known as the Duryea Zouaves, in which he was made captain, and later major and lieutenant-colonel; and served with this regiment till October, 1862, when he was appointed colonel of the 165th New York Volunteers. Near the close of the war he raised and commanded a regiment recruited from the veterans of the 5th and 165th Volunteers. In 1866 he was appointed by Gov. Fenton one of three commissioners to confer with representatives of the State of New Jersey as to quarantine jurisdiction, and in 1889, by Secretary Windom, a special agent of the Treasury Department in Europe.

Humphreys, Willard, educator, born in New York in 1867; died in Princeton, N. J., Sept. 26, 1902. He was educated at Brooklyn Polytechnic Institute and at Berlin and Heidelberg; and was graduated at Columbia University in 1888. In 1892 he was admitted to the New York bar, and in the same year he removed to Princeton. He was Professor of Latin at Princeton University in 1892-'94, when he was transferred to the German department, of which, in 1902, he became head. He was secretary of the New York Medico-Legal Society; editor of the *Columbia Law Times*, of *Selections from Quintus Curtius* (1896), and *Schiller's Jungfrau von Orleans* (1899); and associate editor of the *Medico-Legal Journal*.

Hunnewell, Horatio Hollis, philanthropist, born in Watertown, Mass., July 27, 1810; died in Wellesley, Mass., May 20, 1902. He was educated in Watertown, and in Paris, France. In 1835 he entered the Paris banking-house of Welles & Co., and on his return to the United States, in 1860, established the firm of H. H. Hunnewell & Sons in Boston. He was interested in the construction of Western railroads, and was a director in financial institutions in Boston. Mr. Hunnewell's summer home was in the town of Wellesley, which took its name from Mrs. Hunnewell's family. He gave Wellesley its town hall, its library, and about 20 acres of wooded park.

Hyatt, Alpheus, naturalist, born in Washington, D. C., April 5, 1838; died in Cambridge, Mass., Jan. 15, 1902. He was graduated at Lawrence Scientific School, Harvard, in 1862. During the civil war he served in the 47th Massachusetts Regiment, becoming a captain, after which he renewed his studies under Agassiz, and then passed

a year in Germany. In 1867, in association with Edward S. Morse, Alpheus S. Packard, and Frederick W. Putnam, he settled in Salem, Mass., where he became one of the curators of the Essex Institute and a founder of the Peabody Academy of Sciences. In 1870 he was

elected to the chair of Zoology and Paleontology in the Massachusetts Institute of Technology, which he held for many years, and he also taught in the Boston University, and in connection with the Society of Natural History was manager of the Teachers' School of Science, founded in 1870. Prof. Hyatt had charge of the laboratory of Natural History founded at Annisquam, Mass., by the Woman's Educational Society of Boston during its existence. In 1870 he was elected custodian of the collections of the Boston Society of Natural History, where in 1881 he became a curator. During recent years he had charge of invertebrate fossils in the Museum of Comparative Zoology in Cambridge, and was one of the collaborators of the United States Geological Survey in its field-work and paleontological researches. With Morse, Packard, Putnam, Scudder, and others, he founded the *American Naturalist*, and was one of its editors. He was one of the originators of the American Society of Naturalists, of which he became president at its first meeting, held in Springfield, Mass., in 1883. The American Academy of Arts and Sciences elected him to fellowship in 1869, and he was chosen a member of the National Academy of Sciences in 1876. In 1898 Brown University gave him the degree of LL. D. His scientific researches were largely devoted to the lower forms of animal life, and the more important of his publications were: *Observations on Polyzoa* (1866); *Fossil Cephalopods of the Museum of Comparative Zoology* (1872); *Revision of North American Porifera* (1875-'77), which is the only work on North American commercial sponges; *Genesis of Tertiary Species of Planorbis* at Steinheim (1880), giving the details of his study at Steinheim of fossils that were regarded in Europe as affording the only positive demonstration of the theory of evolution; and *Genera of Fossil Cephalopoda* (1883), containing important contributions to the theory of evolution. *Larval Theory of the Origin of Cellular Tissue* (1884) contains his theory of the origin of sex; and of later date were his monographs on *Genesis of the Arietidae* (Washington, 1889); *Bioplas-tology and the Related Branches of Biologic Research* (1893); *Phylogeny of an Acquired Characteristic* (1894); *Cephalopoda* (1900). Besides the foregoing, Prof. Hyatt edited a series of *Guides for Science Teaching*, and was himself the author of several of the series, including *About Pebbles*; *Commercial and Other Sponges*; *Common Hydroids, Corals, and Echinoderms*; *The Oyster, Clam, and Other Common Mollusks*; and *Worms and Crustaceans*.

Isham, Edward S., lawyer, born in Bennington, Vt., Jan. 15, 1836; died in New York city, Feb. 17, 1902. He was graduated at Williams College in 1857, and later at Harvard Law School; and was admitted to the bar in Rutland. In 1858 he removed to Chicago, and in 1859 became associated with James L. Stark, under the firm name of Isham & Stark, and in 1872 with Robert T. Lincoln, under the firm name of Isham & Lincoln, which subsequently was changed, by

the admission in 1894 of William B. Beale, to Isham, Lincoln & Beale. He was elected to the General Assembly of Illinois in 1864, and served as a member of the Judiciary Committee. He was a trustee and vice-president of the Newberry Library Board; and author of *The Social and Economic Relations of Corporations in the Encyclopedia of Political Science*; *Frontenac and Miles Standish in the Northwest*; and *Ethan Allen, a Study in Civic Authority*.

Johnson, John Butler, educator, born in Marlboro, Ohio, June 11, 1850; died in Pier Cove, Lake Michigan, June 20, 1902. He was graduated at the University of Michigan in 1879, with the degree of civil engineer; served as such on the United States Lake and Mississippi Surveys till 1883, when he became Professor of Civil Engineering in Washington University. In 1898 he was made dean of the College of Mechanics and Engineering in the University of Wisconsin. He was instrumental in securing for the university an engineering building valued at \$100,000 and apparatus valued at \$40,000; conducted a large testing laboratory in St. Louis, in which all the United States timber tests were made; superintended the Index Department of the Journal of the Association of Engineering Societies; contributed largely to engineering literature; and wrote *Topographical Surveying* (1884); *Theory and Practice of Surveying* (1886); *Modern Framed Structures* (1893); *Engineering Contracts and Specifications* (1895); and *Materials of Construction* (1897).

Johnston, Robert, actor, born in Philadelphia in 1827; died in Bath, N. Y., March 19, 1902. He was one of the oldest American actors, and at one time was very well known in the theatrical profession. He made his first appearance at the Arch Street Theater, Philadelphia, before he was twenty, under the management of William E. Burton. After Mr. Burton removed to New York young Johnston managed the Arch Street Theater for a time. He went to New York in 1851 and joined Burton's stock company at the old Chambers Street Theater. After acting several seasons in this company, he went to England and played a long and successful engagement at Surrey Theater, London. When he returned to this country he played for many years in various organizations. In March, 1896, after being in retirement from illness for a number of years, Mr. Johnston entered the Edwin Forrest Home for old actors, but remained only a short time, going thence to the State Soldiers' Home, at Bath, N. Y., to which he was admitted because of his service in the civil war, when he was a captain in the 25th New York Volunteers. He was a fine actor in the old classic drama, and had played in support of Charlotte Cushman, Edwin Forrest, Junius Brutus Booth, and William Macready. He married Nellie Germon in 1858.

Joseph, Jacob, rabbi, born in Wilna, Russia, in 1840; died in New York city, July 28, 1902. He was educated at the Talmudic Academy, studied under Rabbi Israel, and then became a preacher. In 1888 he came to New York city; was made chief rabbi of the United Jewish Congregations; and preached to large congregations of Russian Jews who had immigrated to the United States in 1880. He was head of the Congregation Beth Hamedrash Hagodal for fourteen years. Rabbi Joseph was a charming lecturer, and wrote several books, including *Beth Jacob, a work on Jewish religion, philosophy, and law*. When his death was announced nearly 1,000 people gathered in front of his house, and prayers were offered for the rabbi, and his por-

traits, which had not been seen for several years, were hung in store windows heavily draped in mourning. On the morning of his funeral hundreds of stores were closed in his honor, and the streets were crowded with people. A band of 300 boys, singing psalms, preceded the hearse to six of the largest synagogues on the East Side of the city, in each of which brief services were held. As the funeral cortege was passing a large manufactory on its way to Brooklyn some operatives threw water from windows on the mourners, and in a moment a riot occurred, in which many of the Hebrews were clubbed by the police and otherwise maltreated by a rabble on the street. Mayor Low ordered an official investigation of the action of the police, and the chief precinct officers were blamed for not affording the mourners an adequate escort and for permitting the clubbing.

Jouett, James Edward, naval officer, born in Lexington, Ky., Feb. 27, 1828; died in Sandy Springs, Md., Oct. 1, 1902. He entered the United States navy as midshipman in 1841; was promoted passed midshipman Aug. 10, 1847; master and lieutenant in 1855; lieutenant-commander, July 16, 1862; commander, July 25, 1866; captain, Jan. 6, 1874; commodore, Jan. 11, 1883; and rear-admiral, Feb. 19, 1886; and was retired on reaching the age limit in 1890. After serving in the Mexican War he went to the United States Naval Academy, where he was graduated in 1847. At the outbreak of the civil war he was a lieutenant on the frigate *Santee* of the Western Gulf blockading squadron. In 1861, while in command of a detachment of sailors and marines from the *Santee*, he boarded and destroyed the Confederate vessel *Royal Yacht*, and received wounds in his arm and side. For this achievement Lieut. Jouett received the commendation of his commanding flag-officer and the thanks of the department. Later he received command of the R. R. Cuyler, of the Western Gulf blockading squadron, with which he captured 8 blockade-runners in 1863. He was afterward commander of the *Metacomet*, with which he captured 3 more blockade-runners, and he was selected by Admiral Farragut to accompany the flagship *Hartford* in the battle of Mobile Bay. His little vessel was lashed to the side of *Farragut's* flagship, and passed the forts with her. The *Metacomet* was then detached from the *Hartford*, and Jouett began a chase of Confederate gunboats. He crippled the *Gaines* so that she ran ashore, forced the *Morgan* to retreat, and, after an hour's running fight up the bay, captured the *Selma*. In Admiral Farragut's official report of the battle he says: "Lieut.-Commander Jouett's conduct during the whole affair commands my warmest commendations." Jouett was subsequently engaged on blockade duty off the coast of Texas. In 1874 he became a member of the Board of Inspection, and in 1885, while in command of the North Atlantic squadron, conducted the operations on the Isthmus of Panama and succeeded in quelling one of the most serious revolutions that ever had occurred there. In 1887 he became president of the Board of Inspection and Survey, and served till his retirement.

Kedzie, Robert Clark, chemist, born in Delhi, N. Y., Jan. 23, 1823; died in Lansing, Mich., Nov. 7, 1902. He was graduated at Oberlin College in 1846, and at the Medical Department of the University of Michigan in 1851. When the civil war broke out he enlisted as surgeon of the 12th Michigan Infantry, but resigned in 1863 to become Professor of Chemistry at the Michigan Agricultural College, which post he held till June, 1901, when he was made professor emeritus. He was a member of the Michigan Legislature in 1867; of the State Board of Health in 1873-'81, serving as president in 1877-'81. Prof. Kedzie had been president of the Michigan State Medical Society, the American Public Health Association, the Association of Agricultural Colleges, and the Sanitary Council of the Mississippi Valley.

Kendrick, Adin A., educator, born in Ticonderoga, N. Y., Jan. 7, 1836; died in Alton, Ill., April 7, 1902. He was educated at Granville Academy and at Middlebury College, Vermont; later he studied law and practised for two years. In 1861 he was graduated at the Theological Department of the University of Rochester, and he held pastorates in the Baptist Church till 1872, when he was elected president of Shurtleff College, where he remained till 1894. He was pastor of Immanuel Baptist Church, of St. Louis, in 1894-'99, and in the latter year returned to Shurtleff College as dean of the School of Divinity, where he remained till his death.

Kimball, James Patterson, military medical officer, born in Berkshire, Tioga Co., N. Y., Aug. 21, 1840; died in Ontario, Tannersville, N. Y., April 19, 1902. He was graduated at Hamilton College in 1862, and at Albany Medical College

in 1864. So determined was he to enter the army before the close of the civil war that he completed the work of two years in one at the medical college, and was admitted to the corps of medical cadets. In January, 1865, he was advanced to the rank of assistant surgeon of the 121st New York Infantry. At the battle of Hatcher's Run, in March, he was almost con-

stantly under fire, his duty being to assist in bringing off the wounded as they fell on the field. He passed through the ensuing campaign when for a week the Confederate army was retreating westward from Petersburg, closely pursued by the Army of the Potomac, with a running fight all the way, and he was present at the surrender. He was mustered out in July of that year; and in 1867 he joined the medical staff of the regular army and was made assistant surgeon with the rank of 1st lieutenant. His first important service under this appointment was at Fort Buford, Dakota, from 1867 to 1870. Here the little garrison, surrounded by hostile Sioux and frequently raided, led a lonely and hazardous life. From 1884 to 1887 he was on duty at West Point, and from 1887 to 1896 at various posts in the West, except a part of 1892, when he had leave of absence and visited Europe. He was promoted to the rank of major and surgeon Jan.

24, 1886; lieutenant-colonel and deputy surgeon-general, Feb. 1, 1900; colonel and assistant surgeon-general, Jan. 1, 1902; and on April 7, 1902, he was retired for disability incurred in the line of duty. During the war with Spain he was stationed at Governor's Island, where he performed the double duty of post surgeon and attending surgeon at headquarters, Department of the East. In 1898 the hospital accommodations were more than doubled and the wards were filled with wounded and fever-stricken patients. Besides carrying the great burden of regular duty, Dr. Kimball spent many hours at night answering the constant letters of inquiry concerning wounded or missing soldiers. In 1900 he was promoted to the rank of lieutenant-colonel and deputy surgeon-general, and transferred to Omaha, Neb., as chief surgeon of the Department of the Missouri. The change of climate and of duty was at first beneficial, but in the end the strain of the preceding two years told upon him and his health steadily failed. Through thirty-five years of active service Dr. Kimball placed first his duty to his patients and to the service, yet he always found time for hunting, and he was also a reader of wide range. Outside of his professional reading, his favorite study was botany, and he knew thoroughly the flora of every military post at which he was stationed. An account of some rare or curious plant was often embodied in reports sent to Washington, or to the medical journals (see *Apocynum Cannabinum*, *New York Medical Journal*, 1896, vol. lxi). The language and customs of the Indians, particularly those of the Sioux and Navajos, interested him greatly. His mastery of the Sioux tongue enabled him to discover and decipher the autobiography of Sitting Bull, a narrative told in pictures, which Dr. Kimball contributed to the Smithsonian collections. Both in camp and in garrison he was frequently consulted by the Indians, and he invariably won their confidence and gratitude. Both as a physician and as a surgeon he was cautious and conservative, yet alert and daring when necessary. Thus in a case of maggots in the nose (the larvae of a little-known fly had been deposited in diseased tissues) he saved the life of a soldier by heroic injections of chloroform (see his report of the case, *New York Medical Journal*, 1893, vol. lvii). Again, an officer wounded in an Indian campaign was being tortured to death by the jolting of the hospital ambulance. The command was ordered to halt while the surgeon devised a litter on wheels upon which he successfully carried his patient for a month's march across the plains. His article on Transportation of the Wounded in War, written at the outbreak of war with Spain, was considered authoritative (*Albany Medical Annals*, 1898, vol. xix; *Medical News*, New York, 1898, vol. lxxii; *Journal Military Service Institution*, U. S., Governor's Island, New York Harbor, 1898, vol. xxiii). In 1899 he was president of the Albany Medical College Alumni in the City of New York. A high medical authority writes: "As a military surgeon and sanitarian Dr. Kimball stood very high, not as a brilliant man, fond of innovation and display, but as one imbued with the highest sense of duty. His reports to the department all show care and a low mortality rate, and to this he lent every effort. His personality was quiet and yet magnetic, his manner dignified but always approachable, his voice was low, sweet, and musical." In 1869 Dr. Kimball married Sarah Eddy, of Albany, N. Y., who died in 1890, and in 1892 Maria Porter Brace, who survives him.

Kimberly, Lewis Ashfield, naval officer, born in Troy, N. Y., April 2, 1830; died in West Newton, Mass., Jan. 28, 1902. He was graduated at the United States Naval Academy and made passed midshipman June 8, 1852; master and lieutenant in 1855; lieutenant-commander in 1862; commander in 1866; captain in 1874; commodore in 1884; and rear-admiral in 1887; and was retired April 2, 1892. When the civil war broke out he served on the frigate *Potomac* of the Western Gulf blockading squadron till 1862, when he was transferred to the *Hartford*, on which he served till the close of the war, taking part in the engagement and passage of the Port Hudson batteries, the engagement with the batteries at Grand Gulf and Warrington, on the Mississippi, and the battle of Mobile Bay. Capt. Percival Drayton, in his official report of the battle of Mobile Bay, said: "To Lieut.-Commander Kimberly, the executive officer, I am indebted not only for the fine example of coolness and self-possession which he set to those around him, but also for the excellent condition to which he had brought everything belonging to the fighting department of the ship, in consequence of which there was no confusion anywhere, even when, from the terrible slaughter at some of the guns, it might have been looked for." After the war he was attached to the steam frigate *Colorado*, flagship of the European squadron, and on becoming a commander was transferred to the receiving-ship *New York*. He commanded the *Benecia* on the Asiatic coast in 1870-'72, and later the *Canonicus* of the North Atlantic squadron, the *Monongahela*, and the *Omaha*; was on duty at the New York Navy-Yard in 1880-'83; a member of the Examining and Retiring Boards in Washington in 1884-'85; commandant of Boston Navy-Yard in 1886; and of the Pacific station in 1887. In 1889, while he commanded the fleet in the Pacific, during the trying period of negotiations with Germany over the Samoan difficulty, his ships were wrecked in the hurricane at Apia, the *Trenton* and *Vandalia* being completely destroyed and the *Nipsic* cast ashore. From 1890 till his retirement he served as president of the Naval Board of Inspection and Survey.

Kling, Isaac, inventor, born in Hirschberg, Germany, March 16, 1835; died in Louisville, Ky., June 12, 1902. He came to the United States in 1854. His chief inventions were an automatic car-coupler for use on both freight and passenger cars and a steam-engine occupying a space of 3 square feet which developed 100 horsepower. He received the patent on this engine three days before his death.

Knowles, Edwin (Philander Milton Knowles), actor, born in Hamlet, R. I., June 27, 1845; died in Brooklyn, N. Y., April 14, 1902. He was of Quaker parentage, and was apprenticed in boyhood to a blacksmith, but early showed a taste for reading and declamation, and while still a lad he appeared in the town hall in his native village in a scene from *Hamlet*. In 1867 he became a supernumerary at the old New York Theater, managed by the Worrell Sisters. After a brief experience in this capacity, he joined a traveling company, and before long he had had sufficient dramatic practise to be able to play minor rôles. He acted in the stock companies of Troy and New Orleans, the John E. Owens Company, and the stock organizations of Cincinnati, Cleveland, and other cities. During these engagements he advanced from playing unimportant characters to the place of leading man. He obtained a play entitled *The Black Flag*, which displayed his talents to the best advantage, and he traveled with

it as a star for many seasons with much success. In 1882 Mr. Knowles, in partnership with Col. Theodore Morris, leased the Grand Opera-House, Brooklyn, and he managed it until 1888, when he disposed of his interest and became one of the lessees of Amphion Academy, Brooklyn. From 1892 to 1896 he was interested also in Brooklyn Columbia Theater. In 1894 he became A. M. Palmer's partner in the management of Brooklyn Park Theater, and he also took a lease of Fifth Avenue Theater, New York, managing it successfully for three years, and in 1900 disposing of his interest in it to F. F. Proctor. Mr. Knowles was very successful in organizing and managing traveling companies, and he owned an interest in some of the best plays on the road, among which were *The Great Diamond Robbery* and four *Quo Vadis* companies. In theatrical club life he was a prominent figure, serving several times as vice-president and secretary of the Actors' Fund, and acting as president of the Actors' Order of Friendship, vice-president of the Hanover Club, and president of the Aurora Grata Club, Brooklyn, and as treasurer of the Theatrical Managers' Association of the United States. He married, in 1876, Sarah E. Goodrich, of Chicago. Mr. Knowles was associated with nearly all the distinguished actors of his time, and was a leading spirit in everything that could improve the condition of the stage and theatrical life in general.

Latane, James Allen, clergyman, born in Essex County, Virginia, Jan. 15, 1831; died in Baltimore, Md., Feb. 21, 1902. He was graduated at the Law Department of the University of Virginia in 1852, and at the Episcopal Theological Seminary in 1854. He organized Trinity Protestant Episcopal Church in Staunton, Va., in 1857, and was its rector fourteen years. He was then called to St. Matthew's Church, Wheeling, W. Va., where he remained till 1874, when he formally withdrew from the Protestant Episcopal Church and announced his adhesion to the Reformed Episcopal tenets. Returning to his early home, he founded a church in Essex County and one in King William County. He declined the bishopric of the Reformed Episcopal Church in Chicago in 1876, but accepted on being again chosen in 1879, and was assigned to the Southern jurisdiction. In 1883 he was elected presiding bishop of the Reformed Episcopal Church in the United States, and in 1901 was made Bishop of the Synod of New York and Philadelphia.

Leeds, Albert Ripley, chemist, born in Philadelphia, Pa., June 27, 1843; died there, March 13, 1902. He was graduated at Harvard University in 1865, and before graduation he was appointed Professor of Chemistry in the Philadelphia High School, and in the following year to the same chair in the Franklin Institute, the Philadelphia Dental College, and Haverford College. The three latter professorships necessitated incessant lecturing and teaching, and in the attempt to discharge these duties his health broke down. Resigning them, he spent two years in travel in Europe. On his return he organized the Department of Chemistry at Stevens Institute of Technology. During the first five years Prof. Leeds contributed papers on new mineral species and on lithology, which he published in the *American Journal of Science*. Subsequently the teaching of analytical chemistry occupied most of his time, and 30 papers on this topic were published in the *Fresenius Zeitschrift* and the *Chemical News*. On election as presiding officer of the American Chemical Society and Secretary of the New York Academy of Sciences, he turned his attention to technical and general

chemistry, and published 42 papers thereon in the Proceedings of those societies. In 1872 he became expert chemist to the water-boards of Newark and Jersey City, and afterward he held the same post in Hoboken, Albany, New London, Jamestown, Philadelphia, Reading, Wilmington, Plymouth, Ottawa, and other cities. In 1881 he became a member of the New Jersey State Board of Health and chairman of its Council of Analysts. He was president of the International Water-Purifying Companies. In the early part of 1902 he was prostrated with cancer and was informed that he had a few weeks only to live. At this, he resigned his chair at Stevens Institute, called his classes together, and bade the students farewell. A few days before his death he was presented with a loving-cup by the students.

Lewisohn, Leonard, merchant, born in Hamburg, Germany, about 1848; died in London, England, March 5, 1902. He came to the United States in 1864 as an agent for his father, who was in the feather business, and two years later his brother joined him and the firm of Lewisohn Brothers, importers of feathers, bristles, etc., was formed. In 1868 the brothers engaged in the metal trade, and in a few years became the most conspicuous copper dealers in the United States. Mr. Lewisohn was one of the organizers of the American Smelting and Refining Company, of the Tennessee Copper Company, and the Feather River Exploration Company, and a member of the New York Coffee Exchange. He made many gifts for charitable purposes, including \$100,000 to the Sheltering Guardian Society, \$60,000 to the Montefiore Home, \$50,000 to the Jewish Seminary, and \$10,000 to the Young Men's Hebrew Association. (See GIFTS AND BEQUESTS.)

Lippitt, Francis James, lawyer, born in Providence, R. I., July 19, 1812; died in Washington, D. C., Sept. 27, 1902. He was graduated at Brown University in 1830, and was attached to the American legation in Paris in 1834-'35. He served in the Mexican War as captain of the 1st New York Volunteers, and in 1849 was chairman of the California State Constitutional Convention. In the civil war he was colonel of the 2d California Infantry and was promoted brigadier-general of volunteers. In 1877-'82 he was counsel for the United States in the Department of Justice. He lectured before the Boston University Law School in 1873 and 1874, and the Naval War College in 1896, 1897, and 1900. His publications include *Treatise on the Practical Use of the Three Arms*; *Treatise on Intrenchments*; *Special Operations of War*; *Field Service in War*; *Criminal Law in Massachusetts*; *Physical Proofs of Another Life*; and contributions on economic subjects to American and English periodicals.

Litchfield, Henry G., military officer, born in New York, Dec. 14, 1837; died in New York city, Jan. 26, 1902. He entered the National army as a private in March, 1862; was made 2d lieutenant in the 18th United States Infantry in July, 1862; 1st lieutenant and transferred to the 36th Infantry in April, 1863; captain, February, 1869; assigned to the 2d Artillery in 1871; and was retired in 1892. In September, 1863, he was brevetted captain for gallant and meritorious service in the battle of Chickamauga. He served in the Army of the West; accompanied Sherman in his march to the sea; took part in the battles of Missionary Ridge, Hoover's Gap, Peach Tree Creek, Buzzard's Roost, and Bentonville, N. C., and was brevetted lieutenant-colonel for gallant and meritorious services in the last-named battle. In 1879-'83 he was on special duty on the staff of

Gen. Hancock; in 1886-'89 commanded the military post at St. Augustine, Fla.; and later at Fort Trumbull, Connecticut, and Fort Schuyler, New York.

Lockwood, Henry Clay, lawyer, born about 1839; died in New York city, Dec. 24, 1902. He studied law; entered the National army in 1862; was appointed a captain and assigned to the staff of Brig.-Gen. Morris, and participated in the battles of the Wilderness and Spottsylvania Court-House. He also served on the staffs of Gens. Martindale and Ames; was brevetted major for gallantry at the storming of Fort Fisher in 1865; and was mustered out of the service with the full rank of major in 1866. Returning to New York, he took up the practise of law. In March, 1872, he was commissioned major of the 71st Regiment, N. G. S. N. Y., and in September following lieutenant-colonel. He was author of *The Abolition of the Presidency*; *True History of the Army at Fort Fisher*; and *The Making of the Monocrate*.

Long, Charles D., jurist, born in Grand Blanc, Mich., June 14, 1841; died in Detroit, Mich., June 27, 1902. He entered the National army as a private when the civil war broke out, and in the battle of Wilmington Island, Georgia, in April, 1862, received two severe wounds, which rendered him an invalid for life. A shot shattered his left arm, which had to be amputated above his elbow, and another pierced his hip. He studied law, and was elected a judge of the Supreme Court of Michigan in 1887, and reelected in 1897.

Lord, James Brown, architect, born in New York city, April 26, 1859; died there, June 1, 1902. He was graduated at Princeton University in 1879, and studied architecture with William A. Potter. He designed many of New York's best-known structures, including the two Delmonico buildings; the Hospital for Babies; the courthouse for the Appellate Division of the Supreme Court, in Madison Square; and the first of the Carnegie libraries, and 16 of the other 65. He also designed many of the beautiful homes in Tuxedo Park, completed plans for a new building in University Place for the Sailors' Snug Harbor, and was selected as the architect of the Memorial Building to be erected by the class of 1879 of Princeton University.

Loring, Charles Greely, military officer, born in Boston in 1828; died in Prides Crossing, Mass., Aug. 20, 1902. He was graduated at Harvard University in 1848; served in the civil war as captain, lieutenant-colonel, and inspector-general of the 9th Army Corps till July, 1865, when he resigned; and was brevetted major-general of volunteers. He became a trustee of the American Museum of Fine Arts in 1873, and was executive officer from 1876 till 1902.

McCulloch, Hugh, poet and litterateur, born in Fort Wayne, Ind., March 9, 1869; died in Florence, Italy, March 27, 1902. He was educated at Harvard University, and was an assistant in English there in 1892-'94, afterward going abroad and devoting himself to literary study and work. The *Quest of Herakles*, a volume of poems published several years before his death, exhibited much promise, and was characterized by careful technique and reserve power.

Mackay, John William, capitalist, born in Dublin, Ireland, Nov. 28, 1831; died in London, England, July 20, 1902. He removed with his parents in 1840 to New York, where he learned the ship-building trade. On the discovery of gold in California he went thither and led a miner's life for several years. In 1860 he removed to

Nevada, where he also engaged in mining. In 1872 he was one of the discoverers of the celebrated Bonanza mines, on a ledge in the Sierra Nevada. He was one of the founders of the Bank of Nevada, with headquarters in San Francisco, being also its president till his death. In 1884, in association with James Gordon Bennett, he laid two cables across the Atlantic Ocean, connecting the United States with England and France under the system known as the Commercial Cable Company. Mr. Mackay was a generous patron of religious and charitable institutions, especially those of the Roman Catholic Church. Among his notable benefactions is the Roman Catholic Orphan Asylum in Virginia City, Nev.

McMillan, James, capitalist, born in Hamilton, Ontario, May 12, 1838; died in Manchester, Mass., Aug. 10, 1902. He removed in 1855 to Detroit, Mich., where he entered the hardware business. In 1857 he became a purchasing agent for the Detroit and Milwaukee Railroad Company; and later, with John S. Newberry, organized the Michigan Car Company; became interested in a great number of enterprises, including the Detroit Car-Wheel Company, the Baugh Steam-Forge Company, and the Detroit Iron-Furnace Company, of which he was president, and which employed more than 3,000 men; was active in the construction of the Duluth South Shore and Atlantic Railway, which united the two Michigan peninsulas; and also was connected with steamboat, elevator, telephone, bank, and dry-dock enterprises. He was elected a United States Senator in 1889, 1895, and 1901; was a presidential elector in 1884; and was chairman of the Republican State Convention in 1885 and 1896. He gave the city of Detroit a thoroughly equipped hospital, costing \$250,000, and endowed it with \$300,000; to the University of Michigan, one of the finest Shakespearian libraries in the country and McMillan Hall; to the Agricultural College of the State, the Tupper collection of insects; and also a building for a seminary for colored girls at Crockett, Texas, and a building for the Presbyterian Club of Ann Arbor. (See GIFTS AND BEQUESTS.)

Marquand, Henry Gurdon, capitalist, born in New York city, April 11, 1819; died there, Feb. 26, 1902. He was engaged for twenty years in managing the estate of his brother, and then became a banker. He observed the poor construction and faulty design of city architecture, was among the earliest to become interested in its improvement, and was the first honorary member of the American Institute of Architects. He was one of the purchasers of the Iron Mountain Railroad in 1868, of which he became vice-president and later president, till its incorporation in the Missouri Pacific system, and was a director in the latter company and many other corporations. He devoted much time to the Metropolitan Museum of Art, of which he was first a trustee, then (1870-'90) treasurer, and afterward president, and made it numerous gifts and loans. He presented a chapel and, with Robert Bonner, a gymnasium to Princeton University; with his brother, a pavilion to Bellevue Hospital; and individually founded and endowed the Free Public Library at Little Rock, Ark.

Marsh, Luther Rawson, lawyer, born in Pompey Hill, N. Y., April 4, 1813; died in Middletown, N. Y., Aug. 15, 1902. He studied law and was admitted to the bar in Albany, N. Y., in 1838. He practised in New York city a year, and then in Utica till 1844, when he returned to New York city. He was for a time associated

with Daniel Webster; in 1850-'51 carried on a crusade against intramural burials, and drew the bill of 1850 and the city ordinance of February, 1851, which put an end to the custom. In 1883 he introduced a bill into the Legislature for enlarging the park area, and later was made park commissioner. In 1891 he gave up his law practise and devoted the remainder of his life to lecturing in defense of spiritualism. He came so far under the influence of the notorious Ann O'Delia Diss de Bar that the most influential of his friends of the bar interfered and brought about a separation.

Martin, Augustus P., military officer, born in Abbott, Me., Nov. 23, 1835; died in Dorchester, Mass., March 12, 1902. He was a clerk till 1861, when he went to the front with the Boston Light Artillery, popularly known as Cobb's Battery, and served three months. On his return he was commissioned 1st lieutenant in the 3d Massachusetts Battery; was promoted captain in November; assigned to duty as chief of artillery of the 1st Division, 5th Corps, in 1862, and when the artillery of the 5th Corps was organized into a brigade in May, 1863, he was placed in command of it. He took part in numerous engagements, including the siege of Yorktown and the battles of Hanover Court-House, Mechanicsville, Gaines's Mill, Malvern Hill, Manassas, Antietam, Fredricksburg, Chancellorsville, Gettysburg, the Wilderness, Spottsylvania, and Petersburg. On his return home he resumed mercantile business; was elected mayor of Boston in 1883, and later was appointed police commissioner.

Mason, John L., inventor, born in Philadelphia, Pa., in 1826; died in New York city, Feb. 26, 1902. In 1857 he patented the screw-top glass fruit-jar, on which invention he made an improvement in 1901. He was treasurer and director of the Colonial Bond and Guaranty Company of New York at the time of his death.

Maxwell, Henry W., philanthropist, born in Brooklyn, N. Y., Dec. 7, 1850; died in Bay Shore, Long Island, May 11, 1902. Early in life with his brother, J. Rogers Maxwell, he became interested in railroad enterprises. At the time of his death he was a member of the stock-brokerage firm of Maxwell & Graves. He was president of the Board of Regents of Long Island College Hospital, Trustee of the Brooklyn Institute of Arts and Sciences, and treasurer of Polhemus Memorial Clinic. Mr. Maxwell built and equipped three industrial schools for the Brooklyn Industrial School Association; built the Maxwell House and Kindergarten and presented it to the Brooklyn Guild Association; erected a dormitory and Nurses' Home for Long Island College Hospital; and, among other benefactions, gave \$60,000 to Long Island College Hospital for the establishment of an operating-room and \$20,000 for the relief of the Johnstown-flood sufferers.

Merrill, Moses, educator, born in Methuen, Mass., in 1833; died in Boston, Mass., April 26, 1902. He was graduated at Harvard University in 1856, and taught in Cambridge, Mass., till 1858, when he became a master in the Boston Latin School. He was made head master in 1879, and resigned on account of failing health in 1901.

Miller, Alfred Brashear, educator, born in Brownsville, Pa., Oct. 16, 1829; died in Waynesburg, Pa., Jan. 30, 1902. He was graduated at Waynesburg College in 1853, and was Professor of Mathematics there in 1853-'58; president in 1858-'69; and later president emeritus and acting professor of the philosophical sciences. He was pastor of a Cumberland Presbyterian Church in Waynesburg ten years, and lecturer before

teachers' institutes, summer schools, and Chautauquas. He was author of *Doctrines and Genius of the Cumberland Presbyterian Church* and a contributor to periodicals.

Mitchell, Henry, engineer, born in Nantucket, Mass., Sept. 16, 1830; died in Boston, Mass., Dec. 11, 1902. He was educated at the Normal School in Bridgewater, Mass.; entered the Government service as a civil engineer in 1851; was assistant to the commissioners on harbor encroachments of New York in 1859; led an expedition under Count de Lesseps in connection with the Panama Canal scheme; was consulting engineer of the United States Commission on Boston harbor; was appointed in 1874 to represent the Coast and Geodetic Survey on the Board of Engineers having in charge the improvement of the mouth of the Mississippi river; and served on the Advisory Board of the Harbor Commission of Virginia and Rhode Island in 1875-77. He was appointed Professor of Physical Hydrography at the Massachusetts Institute of Technology in 1899, and to the same chair in the Agassiz School of Science in 1873, but was unable to perform the duties. He was the author of articles on tides and tidal phenomena, river currents, and other subjects connected with physical hydrology. He also published an elaborate defense of Count de Lesseps.

Moore, Edward Mott, physician, born in Rahway, N. J., July 15, 1814; died in Rochester, N. Y., March 3, 1902. His family removed to Rochester, N. Y., in 1830. In 1838 he was graduated at the medical department of the University of Pennsylvania, and began practice in Rochester. In 1843 he was elected Professor of Surgery in the Medical College at Woodstock, Vt. From 1858 till 1883 he held the same chair in Buffalo Medical College. He was the first president of the New York State Board of Health and at one time he was president of the Medical Society of the State of New York. He had also been president of the National Surgical Association and of the National Medical Association. His investigations resulted in important additions to the pathology of the heart, and they were recorded in numerous medical papers. For many years he was president of the Board of Trustees of the University of Rochester. He also organized the Rochester Public Health Association.

Morgan, Thomas Jefferson, soldier and educator, born in Franklin, Ind., Aug. 17, 1839; died in Ossining, N. Y., July 13, 1902. He was the son of the Hon. and Rev. Lewis Morgan, and was educated at Franklin College, which he left in his senior year (1861) to enlist in the 7th Indiana Volunteer Infantry, where he served for three months, and then became superintendent of schools in Atlanta, Ill. The next year he entered as a 1st lieutenant the 70th Indiana Volunteer Infantry, which was commanded by Benjamin Harrison, afterward President, and served continuously till the close of the war in 1865, leaving the army with the rank of brevet brigadier-general, bestowed "for gallant and meritorious service during the war." He organized three

regiments of colored infantry, and commanded the first colored brigade of the Army of the Cumberland. He was for a time on the staff of Gen. Oliver O. Howard, and distinguished himself in the battle of Resaca; and again especially at the battle of Nashville, where he commanded a division. After the war he studied theology, being graduated at Rochester Theological Seminary in 1868, and then for three years was corresponding secretary of the New York Baptist Union for Ministerial Education. He was pastor of a church in Brownville, Neb., one year, and later was principal of the Nebraska State Normal School. From 1874 to 1881 he was Professor of Homiletics and Church History in Chicago Theological Seminary; after which he was principal successively of the normal schools at Potsdam, N. Y. (1881-'83), and Providence, R. I. (1884-'89). In July, 1889, he was appointed Commissioner of Indian Affairs, which office he held through President Harrison's administration. In this office he devoted his energies to the extension of the public-school system to the Indian schools. Agreeing with President Harrison in the fundamental doctrine of the absolute separation of Church and state, he recommended that the cost of educating the wards of the General Government be assumed by that Government, and succeeded in breaking up, with excellent results, the long-established system of so-called contract schools. He also placed the schools and other departments of the Indian service under the civil-service rules. On retiring from that office in 1893, he became corresponding secretary of the American Baptist Home Mission Society, to which service he gave the remaining nine years of his life. His work here as chief executive officer was extended and arduous along all lines. The extension of schools for the colored people in the South and West being one of the primary interests of the society, Gen. Morgan's attainments as an educator, administrator, and commander of colored troops especially fitted him to increase and broaden the efficiency of this branch of mission work. He aimed at a middle course between misplaced philanthropic efforts at too ambitious culture and what he considered a too strictly industrial training. He received the degrees of D. D. and LL. D., and was a member of the Phi Beta Kappa and a companion of the Loyal Legion. He married in 1870 Caroline, daughter of Hon. Frederick Starr, of Rochester, who survives him. Gen. Morgan wrote frequently for the periodicals of his denomination and the press at large; edited the *Home Mission Monthly*, the *Students' Hymnal*, and the *Praise Hymnal*; and published in book form *Educational Mosaics* (1887); *Studies in Pedagogy* (1888); *Patriotic Citizenship* (1895); and *The Negro in America* (1900).

Morton, Henry, physicist, born in New York city, Dec. 11, 1836; died there, May 9, 1902. He was the son of the Rev. Henry J. Morton, rector of St. James's Protestant Episcopal Church in Philadelphia, and was educated at the University of Pennsylvania, where, after graduation in 1857 with the valedictory, he took a post-graduate course in chemistry. He then turned his attention to law, but, having been invited to lecture on chemistry and physics in the Episcopal Academy of Philadelphia, he found that task so congenial that he soon relinquished his law studies. In 1863 he was chosen Professor of Chemistry in Philadelphia Dental College, and a year later he became resident secretary of the Franklin Institute in Philadelphia, in connection with which he began the delivery of a series of lectures on light, sound, and similar topics, which were so

brilliantly illustrated that they gave him a high standing as a popular lecturer. He was invited to the chair of Physics and Chemistry in the University of Pennsylvania during the absence of Prof. John F. Frazer in 1867-'68, and in 1869 the professorship was divided and the chair of Chem-

istry was assigned to him. In 1870 he resigned his connection with the Franklin Institute to accept the presidential chair of the Stevens Institute of Technology, then about to be organized in Hoboken, N. J., under the will of Edwin A. Stevens. The building of this institution was then in course of erection, and President Morton was entrusted with the

selection of a faculty, with whom he arranged the courses of instruction. This office he continued to hold until his death, having, in 1880, presented the institution with a workshop fitted up with steam-engines and machine tools at a cost of more than \$10,000. In 1883 he established the department of applied electricity, presenting \$2,500 for the purchase of electrical apparatus and machinery, and guaranteeing the salary of the professor who should take charge of that department. Again, in 1888, he gave \$10,000 to the institution as the first instalment with which to endow a chair of Engineering Practice, to which, in 1892, he added a similar amount. At the time of the celebration of the twenty-fifth anniversary of the organization of the institution he added \$25,000 to his donations, and in 1900 \$15,000, and again in 1901 \$50,000. His total contributions to the funds of Stevens Institute amounted to more than \$150,000. Dr. Morton organized and conducted the photographic department of the Eclipse Expedition that was sent, in 1869, to Iowa under the auspices of the United States Nautical Almanac Office. He obtained numerous satisfactory exposures, and was the first to prove the true nature of the bright light of the sun's disk adjacent to the edge of the moon, seen in partial phase-eclipse photographs. This phenomenon, which had been previously noticed by Stephen Alexander, Warren de la Rue, and Sir George B. Airy, was explained as a subjective effect not really existing in the picture but developed to the eye by contrast. President Morton was a member of the private expedition that was organized by Henry Draper to observe the total solar eclipse of July 29, 1878, at Rawlins, Wyo. His most important and extensive researches were on the fluorescent and absorption spectra of the uranium salts, in connection with which he examined the spectrum of anthracene, pyrene, chrysene, and a new solid hydrocarbon found in certain petroleum distillates. This new body he named thallene, from its brilliant green fluorescence. In 1878 he was appointed to the vacancy on the Lighthouse Board caused by the death of Joseph Henry, and he continued in that office seven years, conducting meanwhile various investigations on fog-signals, electric lighting, fire-extinguishers, illuminating buoys, and like subjects, which appeared in the annual reports of

the board. President Morton appeared frequently in court as an expert on questions relating to chemistry and physics in connection with patent suits, and acquired an extended reputation for that work. His printed testimony, it is said, "if collected in separate form, would equal in volume a set of Scott's novels." The degree of Ph. D. was conferred upon him by Dickinson College in 1869, and by Princeton in 1871, and that of D. Sc. by Pennsylvania, and LL. D. by Princeton in 1897. In 1874 he was chosen to the National Academy of Sciences, on several of whose commissions he served. During 1867-'70 he was editor of the journal of the Franklin Institute. Besides articles on electricity and fluorescence contributed to the *Universal Cyclopædia*, he published the results of his researches in the scientific journals of this country and Europe. He was associated in the preparation of *The Student's Practical Chemistry* (Philadelphia, 1868), and also, during his college course in 1859, in the publication of a translation of the trilingual hieroglyphic inscription of the Rosetta stone, for which he made the lithographic drawings. (See *Biographical Notice of President Henry Morton*, Ph. D., of the Stevens Institute of Technology, prepared by Prof. Coleman Sellers, E. D., and Prof. Albert R. Leeds, Ph. D., New York, 1892.)

Morton, Julius Sterling, agriculturist, born in Adams, N. Y., April 22, 1832; died in Lake Forest, Ill., April 27, 1902. He was graduated at Union College in 1854; removed to Nebraska City in 1855; became editor of the *Nebraska City News*; a member of the Territorial Legislature in 1856 and 1857; secretary of the Territory in 1858; acting Governor on the resignation of Gov. Richardson a few months later; and was appointed Secretary of the United States Department of Agriculture in 1893, which post he held till 1897. Mr. Morton was the originator of Arbor Day; one of the original members of the Nebraska Territorial Board of Agriculture and of the Territorial Horticultural Society; later served as president of both organizations; was a charter member of the Nebraska State Historical Society, of which he also was president; and was editor of the *Conservative*, a weekly journal.

Moses, Adolph, rabbi, born in Posen about 1840; died in Louisville, Ky., Jan. 8, 1902. He was graduated at Breslau University, and became a teacher of Hebrew. He was a soldier under Garibaldi; came to the United States in the sixties, and from that time till his death preached in Montgomery and Mobile, Ala., and for twenty-one years was rabbi of the Temple Adas Israel in Louisville, Ky. He also studied medicine and received the degree of M. D. Rabbi Moses was an eloquent speaker and a forceful writer. His publications include *Religion of Moses*; *Loser, the Watchmaker*; and frequent contributions to the weekly press.

Mundé, Paul Fortunatus, surgeon, born in Dresden, Saxony, Sept. 7, 1846; died in New York city, Feb. 7, 1902. In 1863 he entered the Medical Department of Yale University, but left before his course was completed to enter the National army as medical cadet. After serving six months he went to the Harvard Medical School, where he was graduated in 1866, and went to Germany. He became assistant surgeon in the Bavarian army, and served through the war of 1866, after which he was on hospital duty at Würzburg. In 1870 he enlisted in the Bavarian army as battalion surgeon with the rank of 1st lieutenant, and served in the Franco-Prussian War. In 1872 he returned to the United States, where he made a specialty of gynecology. He was Professor of

Gynecology at the New York Polyclinic and at Dartmouth College, and also was gynecologist to Mount Sinai Hospital, consulting gynecologist to the Mothers' and Babies' and the Skin and Cancer Hospitals; and consulting obstetrician to the City Maternity Hospital. He was editor of the American Journal of Obstetrics in 1872-'92; president of the New York Obstetrical Society in 1886-'88; invented numerous instruments for the practise of his specialty; and was author of *Obstetric Palpation* (1880); *Minor Surgical Gynecology* (1880); *Appendix to Midwifery of Cazeaux and Tamier* (1884); and *Pregnancy and the Puerperal State* (1887).

Munstery, Thomas Hoyer Munster, maître d'armes, born in Baltimore in 1814; died in Chicago, Jan. 2, 1902. His mother was the daughter of a famous Swedish beauty who was reported to have been the morganatic wife of King Frederick William II of Prussia, and his father was a Danish nobleman, who was expelled from the Danish court because of a duel that was unfavorably regarded. He was afterward made Governor of Santa Cruz, but left that place in 1812 and came with his wife to the United States and lived for a time in Baltimore. They returned to Denmark in 1820. When the boy Thomas was fifteen years old, he entered the Danish navy and served for three years. While in port at Rio Janeiro he killed a man who had insulted him. No action was taken against him in the matter, however, and he soon went to Stockholm, where he studied fencing and athletics under Dr. Linge, inventor of the Swedish system of massage. Under this instruction he became an expert swordsman and developed phenomenal strength. In 1836 he went to St. Petersburg as fencing-master and commander of the body-guard of the Grand Duke Constantine. For the amusement of the court, he fought with every one that wished to test his strength, including wild men from beyond the frontier, and he became such a favorite that a palace and large sums of money were given to him. But because of an intrigue with one of the ladies of the court he was exiled from Russia, and went to Copenhagen with almost empty pockets. He soon won enough money at cards, however, to go to Berlin, where he boldly claimed the right to a commission in the army on account of the Hohenzollern blood inherited from his mother. His story and his claim were not agreeable to the reigning family, and he soon found himself in prison at Spandau, from which, after a short time, he was suddenly set free without a trial. He never knew why he was released, but ascribed it to the pleadings of his mother, the reputed daughter of Frederick William II. After obtaining his freedom, young Munstery became infatuated with a lady in whom a Danish nobleman was interested; the two men fought a duel on her account, and the nobleman was killed. Munstery hurriedly departed for America and joined the United States navy, seeing some service and receiving wounds, for the treatment of which he was taken to the naval hospital at Portsmouth, N. H. After his recovery he went to Philadelphia and sold cigars for a time, but his love of adventure made him restless, and he soon went to Nicaragua, where he found a revolution in progress, in which he joined, killing several men and receiving severe wounds himself. From Nicaragua he went to Cuba with Narciso Lopez, thence to the United States of Colombia, where he fought for the dictator, José María Melo. He came very near being hanged, but escaped to New York, and in 1855 he returned to Copenhagen just in time to act as second in a duel for the

Spanish *chargé d'affaires*. After this he went to Madrid, where he displayed his skill in arms and his wonderful strength for the amusement of royalty and the nobility, and became a high favorite, with gold showered upon him. The Spanish Government sent him to Cuba to teach the use of the sword and bayonet to the soldiers there. In Cuba he had many adventures, and a jealous rival in love bribed a barber to disable him. The barber had been summoned to bleed him for a fever, but he treacherously cut a tendon in the sword-arm, supposing that the injury would be permanent. Munstery asserted that, thanks to the tricks in massage and sword practise learned from Dr. Linge, he was able to overcome the effect of this injury, and as soon as he could use his arm again he assembled a band of 50 adventurers, and they went to Honduras to take part in a revolution in that country. The whole band was captured, and Munstery was put under a guard of 8 men. He killed 3 of them and broke the bayonets of 3 more, and the other 2 ran away. He made his escape, and was about to leave the country when President Guardiola heard of his exploit with the revolutionists and made him a general. The hero fought the strongest man in Honduras before an audience of 20,000 people and won. He became a popular favorite, and all went well with him until he aroused the jealousy of the President by paying too marked attention to Madame Guardiola. He was sentenced to fight a bull in the public arena, and one week was allowed him to prepare for the contest. He had in the city an American friend, Dr. Wells, who helped him to buy 6 bulls, and with these animals he practised a week, killing one bull every day. He won the fight in the arena against a bull with filed horns. Guardiola, still angry, tried to get rid of him by forcing him to go to the frontier and fight a wild tribe that was making trouble. Munstery was captured and tied to a tree overnight, to be killed in the morning. He managed to escape, and made his way to San Salvador, and thence to Chiapas, gathering about him 12 followers. At Chiapas he was made chief of cavalry in a war against Miramon and Ortega. He became separated from his companions, and it was said that he alone fought 10 men, killing them all. He discovered Ortega's stolen treasure, amounting to \$100,000, which he hid, but he afterward lost the maps showing where he had buried it. He was wounded in this last adventure so badly that he determined to fight no more, and he returned to the United States and settled in Chicago, where he became the best known *maître d'armes* in the country. Among the many actors he trained in fencing were Edwin Forrest, Edward L. Davenport, Junius Brutus Booth, Jr., Edwin Booth, and Francis Wilson. General Munstery was a man of distinguished presence and charming personality. He had acted as principal in 20 duels, and as second in 33.

Nast, Thomas, caricaturist, born in Landau, Bavaria, Sept. 27, 1840; died in Guayaquil, Ecuador, Dec. 7, 1902. He went to New York with his mother and sister in June, 1846, attended the public schools for a short time, and when fourteen years old was employed as doorkeeper at Bryant's gallery of paintings. In 1855 he applied to Frank Leslie for employment as a draughtsman, and began work on a salary of \$5 a week, studying at the School of Design in the evenings. He soon acquired a local reputation, which became international in 1860 when he went to England to make sketches of a prize fight for the Illustrated News. Next he drifted to Italy, where he followed Garibaldi's campaign. He was

present at the sieges of Capua and Gaeta, and sold sketches of the events he witnessed to periodicals in the United States, France, and England. He then returned to New York, and in 1862 became a regular contributor to Harper's Weekly. The civil war gave him abundant opportunity, and he was often sent to the front to sketch battle and camp scenes. He developed into a political cartoonist as the armed conflict subsided, espousing the Republican cause with vigor. His pictorial attacks on the Tweed ring contributed not a little to the downfall of that corrupt oligarchy. Many of his creations have passed into types. It was he who invented the tiger as the symbol of Tammany Hall, the elephant as the emblem of the Republican party, and the donkey as representing the Democracy. When there was question of reducing the military and naval appropriations, he depicted the United States army as a skeleton, a timely defense, which was afterward acknowledged by the presentation to him of a silver vase by 3,500 officers and enlisted men of the army and navy. In 1872 his cartoons were conspicuous in the campaign against Mr. Greeley. In that year he began the publication of Nast's Illustrated Almanac, which he continued for several years. In 1873 he visited the larger cities of the country, lecturing and illustrating his lectures with cartoons drawn in the presence of the audience. In 1876 he made cartoons on the Hayes-Tilden campaign, representing Mr. Tilden as a sphinx. In 1884 he was on the Democratic side, opposing Mr. Blaine in a very bitter manner. Soon afterward he left Harper's Weekly. Nast was in comfortable circumstances at one time, but nearly all his savings were lost in the Grant & Ward failure in 1884, and he again took to lecturing. In 1892 he established Nast's Weekly, opening a campaign against police corruption in New York, which was of brief duration. In 1894 he visited London to do special work for the Pall Mall Magazine, but soon returned and devoted himself to illustrating books, including an edition of Robinson Crusoe, and the works of Petroleum V. Nasby and other comic writers. On May 2, 1902, he was appointed consul-general at Guayaquil, for which post he sailed on July 1. On Dec. 4 he was attacked by yellow fever. Besides his work with the pencil, Nast painted in oil and water-colors. His best known picture is the Departure of the Seventh Regiment for the War, 1861. It represents the troops passing the corner of Broadway and Prince Street, and vividly depicts the intense excitement of the time. It was bought by the Seventh Regiment, of which Nast was a member. Among his numerous other paintings are Peace Again (1865); Lincoln Entering Richmond (1868); St. Nicholas (1895); and The Immortal Light of Genius (1896), painted for Sir Henry Irving. Nast's home for twenty-five years prior to his death was at Morristown, N. J.

Needham, George C., evangelist; born in Ireland about 1842; died in Marberth, Pa., Feb. 16, 1902. He worked a year in a business house in Dublin, and then became an evangelist. He preached throughout England and Ireland till 1868, when he came to the United States. The greater part of his life was passed in constant movement from one part of the country to another. He wrote much on Biblical themes. Among his best known works are Shadow and Substance; Conflict and Courage; The Spiritual Life; and Street Arabs.

Norris, Frank, author, born in Chicago, Ill., in 1870; died in San Francisco, Cal., Oct. 25, 1902. He was educated at the San Francisco High

School, the University of California, and Harvard University; studied art in Paris in 1887-'89; was war correspondent for the San Francisco Chronicle in South Africa during the Uitlander excitement in 1895-'96; editor of the San Francisco Wave in 1896-'97; war correspondent for McClure's Magazine in Cuba in 1898; and was author of McTague, The Octopus, and The Pit. The latter, his last work, ran serially in the Saturday Evening Post, of Philadelphia, in 1902-'03.

Ochiltree, Thomas P., journalist, born in Nacogdoches County, Texas, in 1840; died in Hot Springs, Va., Nov. 25, 1902. At the age of fifteen years he enlisted in the Texas Rangers, and served in the campaign against the Apache and Comanche Indians in 1854-'55. He was editor of the Jeffersonian in 1860-'61; entered the Confederate army at the outbreak of the civil war, and served on the staffs of Gens. Green, Taylor, and Sibley. He was promoted major and colonel, and was taken prisoner at the battle of Five Forks. In the autumn of 1865 he returned to Texas and engaged in journalism. He became United States marshal for Texas, editor of the Houston Daily Telegraph in 1866, Texas State Commissioner of Emigration to Europe, and the first native Texan ever elected to Congress (1882). He was the author of several pamphlets on Texas and her resources.

Osborn, Virginia E., philanthropist, died in New York city, Feb. 7, 1902. She was the widow of William H. Osborn, formerly president of the Illinois Central Railroad, who died in 1894. For many years she was actively identified with charitable institutions in New York city, including the City Mission and the Cooking-School, and she was a founder of Bellevue Hospital Training-School for Nurses.

Osborne, William McKinley, lawyer, born in Girard, Ohio, April 26, 1842; died in Wimbledon, England, April 29, 1902. He was educated at Poland Academy, Ohio, and Allegheny College; enlisted in the 23d Ohio Regiment when the civil war broke out; and after a year's service was taken ill with typhoid fever. After his recovery he studied law; was admitted to the bar in 1864; and practised in Youngstown, Ohio, till 1880, during part of which time (1874-'75) he was mayor. He then removed to Boston, Mass., where he practised his profession; was a member of the Common Council in 1884 and 1885; of the Board of Police Commissioners in 1885-'93; and Secretary of the National Republican Convention in 1896. In 1897 he was appointed United States consul-general in London.

Osmun, Thomas Embley (Alfred Ayres), author, orthoepist, elocutionist, and dramatic critic; born in Montrose, Ohio, Feb. 26, 1834; died in New York, Oct. 26, 1902. He was graduated at Oberlin College, after which he spent six years in Paris and Berlin, studying medicine and languages. He returned to the United States in 1859, and became a resident of New York city. His attention was attracted to the wide-spread misuse of his native tongue, as shown in current "newspaper English," and he resolved to make it his life-work to attempt to preserve the purity of the English language in the public press. He argued for the better use of words in every avenue that lay open to him, writing personally to advertisers in the newspapers and pointing out to them the defects in their advertisements, and remonstrating with editors for permitting bad English to appear in their publications. This led naturally to the writing of several books on the subject, namely, The Orthoepist, The Verbal-

ist, and Some Ill-Used Words, all of which have become authorities on the use of English. He became a dramatic critic, and finally a teacher of elocution, always laboring to bring about a better pronunciation and emphasis in English upon the stage.

When he was in Germany, as a young man, he played Shylock, Richelieu, and other leading rôles, in the German tongue; and in May, 1891, he appeared as Shylock in Boston, playing that part afterward throughout New England. His books on topics connected with the stage are *Actors and Acting* and *The Art of Acting*. His personal appearance was distinguished, and his manner was that of the gentleman of the old school. He abounded in kindly and benevolent impulses, and often went out of his way to have infractions of the law punished when children or other helpless persons were the sufferers, and sometimes when the good of the general public demanded something that the general public neglected.

Packard, Joseph, clergyman; born in Wiscasset, Me., Dec. 23, 1812; died in Alexandria, Va., May 3, 1902. He was graduated at Bowdoin College in 1831; was a professor at Bristol College, Pennsylvania in 1834-'36; and was ordained in the Protestant Episcopal Church in 1837. He was Professor of Sacred Literature in the Protestant Episcopal Theological Seminary of Virginia from 1837 till 1890, and during that time was dean fifteen years. In 1890 he was made professor emeritus. He was a member of the American Committee on the Revision of the Bible in 1872-'85, prepared the work on Malachi for Lange's Commentary, and was a frequent contributor to Church periodicals.

Paine, Levi Leonard, educator; born in Holbrook, Mass., Oct. 10, 1832; died in Bangor, Me., May 10, 1902. He was graduated at Yale University in 1856, and at its Theological Seminary in 1861; and preached in Farmington, Conn., till 1870, when he became dean of Bangor Theological Seminary, which post he held till his death. He was president of the Maine Missionary Society in 1888-'94. He wrote a *Critical History of the Evolution of Trinitarianism and The Ethnic Trinities*.

Palmer, Alice Freeman, educator, born in Colesville, N. Y., Feb. 21, 1855; died in Paris, France, Dec. 6, 1902. She was graduated at the University of Michigan in 1876, was appointed teacher of Greek, Latin, and Mathematics at Geneva Lake, Wis., where she remained a year, and principal of the high school at East Saginaw, Mich., in 1877, where she remained till 1879, when she became Professor of History in Wellesley College. She held the latter post till 1881, when she became acting president. In 1882 she accepted the presidency of Wellesley College and remained at the head of that institution till 1887, when she married George Herbert Palmer, Professor of Philosophy in Harvard University. In 1892-'95 she was dean of the Woman's Department of the University of Chicago.

Palmer, Benjamin Morgan, clergyman, born in Charleston, S. C., Jan. 25, 1818; died in New

Orleans, La., May 28, 1902. He was graduated at the University of Georgia in 1838, and at Columbia Theological Seminary in 1841; held Presbyterian pastorates in Savannah, Ga., in 1841-'43; in Columbia, S. C., in 1843-'56; and in New Orleans from 1856 till his death. He was Professor of Church History and Polity in Columbia Theological Seminary in 1853-'56; director of the same institution in 1842-'56; and a director of the Southwestern Presbyterian University, Clarksville, Tenn., from 1873 till his death, and of Tulane University from its organization. He frequently served as a commissioner to the General Assembly of his denomination, and was one of the founders, in 1847, of the Southern Presbyterian Review, of which he was editor till his death. He was author of *Life and Letters of J. H. Thornwell* (1875); *Sermons* (1876); *The Family in its Civil and Churchly Aspects* (1876); *Formation of Character* (1889); *The Broken Home* (1890); and *Theology of Prayer* (1894).

Palmer, Francis Asbury, banker, born in New York city in 1812; died there, Nov. 1, 1902. He was noted for his rugged tenacity of purpose and strong will. He served a term as city chamberlain more than twenty-five years ago. At the time of his death he was president of the Broadway Savings-Bank, and had recently retired from the presidency of the Broadway National Bank. Mr. Palmer in life gave much of his large wealth to charitable and educational causes. For about a quarter of a century he was in the habit of giving a dinner on his birthday to several clergymen and others to whom he entrusted the greater part of his philanthropic work. The institutions in which he was most largely interested are the Palmer Institute, in Muncie, Ind., to which he gave \$500,000; the Starkey Seminary, in Eddytown, N. J., to which he gave \$500,000; and Palmer College, in La Grande, Iowa, to which he gave \$30,000.

Palmer, Potter, capitalist, born in Rensselaerville, N. Y., in 1826; died in Chicago, Ill., May 4, 1902. He was in business in Dunham, in Oneida County, and in Lockport, N. Y., till 1852, when he established in Chicago a dry-goods store, which became widely known under the name of Field, Palmer & Leiter. In 1867 he retired, and engaged in real-estate operations. He purchased three-quarters of a mile of property, and built the Palmer House, which was half completed when it, with 35 other buildings that he owned, was destroyed by the great fire of 1871. He rebuilt the Palmer House at a cost of \$2,500,000, and many other buildings, and accumulated a vast fortune. He gave \$200,000 for the Woman's Building at the World's Columbian Exposition in 1893.

Pangborn, Zebina Kellogg, journalist, born in Peachman, Vt., July 31, 1829, died in Hilburn, N. Y., Nov. 1, 1902. He was graduated at the University of Vermont in 1850; taught school for a short time; and later was principal of two academies in Vermont. In 1854 he gave up teaching for newspaper work, and was successively editor of the *St. Albans (Vermont) Tribune*; the *Worcester Daily Transcript*, and the *Boston Daily Atlas and Bee*. Later he studied law, but abandoned practice to enter the National army at the outbreak of the civil war. He was made paymaster, with the rank of major, and served till 1865, when he became editor of the *Jersey City Times*. In 1867 he founded the *Jersey City Evening Journal*, and he was its editor till 1895, when he sold his interest. Major Pangborn had a high reputation as a political speaker. He was a delegate to the Republican convention that nominated John C. Fremont for the presidency,

and was either a delegate or an alternate to nearly every National convention until his retirement from active work.

Patterson, Calvin, educator, born in Clarendon, N. Y., July 2, 1847; died in Brooklyn, N. Y., Jan. 27, 1902. He was graduated at the Albany Normal Institute in 1867, and later at Rochester University. He taught in Rochester a year, and then in the Buffalo Classical School. In 1871 he became Professor of Mathematics in the New York State Normal School, where he remained till 1873, when he became principal of a grammar school in Brooklyn. In 1882 he became superintendent of public instruction in Brooklyn, and he held this post till 1888, when he was made principal of the Girls' High School, where he remained till his death. He established the first evening sessions of the public schools of Brooklyn.

Pennoyer, Sylvester, lawyer, born in Groton, N. Y., July 6, 1831; died in Portland, Ore., May 30, 1902. He was graduated at Harvard Law School in 1854; removed to Oregon in 1855, and taught school several years. In 1862 he became connected with the lumber industry, in which he acquired large wealth. In 1886 and 1890 he was elected Governor of Oregon, and in 1896 mayor of Portland. He attracted attention while Governor by saying, on an occasion when Secretary of State Gresham conveyed to him certain suggestions of President Cleveland concerning the Chinese exclusion act: "I will attend to my business; let the President attend to his."

Perkins, William Oscar, composer, born in Stockbridge, Vt., May 23, 1831; died in Boston, Mass., Jan. 13, 1902. He was graduated at Kimball Union Academy in 1853; studied music, and then taught in Boston. He organized what is believed to have been the first male quartet for concert singing in the United States, the Mendelssohn Vocal Quartet; became conductor at the Boston Music Hall in 1858; and conducted many musical festivals. He lectured and wrote on musical and other topics; composed numerous part songs and hymns; and compiled and edited many collections of vocal music, his published works numbering 60 volumes. His last composition was *The War in South Africa*; or, *Boer and Briton*.

Pierce, Henry Miller, manufacturer, born in Susquehanna County, Pennsylvania, Oct. 6, 1831; died in Ocala, Fla., Feb. 19, 1902. He was graduated at Waterville (now Colby) University, and was elected president of Rutgers Female College, New York city, which post he held thirteen years. Later he engaged in the wood-alcohol and phosphate industries. On the outbreak of the civil war, he, with two others, organized the army ambulance corps, and he personally directed its work during the campaign on the James, under Gen. McClellan. In 1887 he founded the city of West Nashville, Tenn., where he lived till 1890, when he removed to Washington, and thence, in 1894, to Rochester, N. Y.

Piper, Alexander, military officer, born in Pennsylvania, May 11, 1829; died in New York city, Feb. 21, 1902. He was graduated at West Point in 1847; was brevetted 2d lieutenant, 3d Infantry, July 1, 1851; promoted 2d lieutenant, Dec. 12, 1851; 1st lieutenant, Jan. 31, 1855; captain, 3d Artillery, May 14, 1861; major, 4th Artillery, Dec. 20, 1875; lieutenant-colonel, 1st Artillery, Nov. 8, 1882; transferred to the 3d Artillery, Nov. 10 following, and to the 1st Artillery, Jan. 25, 1885; colonel, 5th Artillery, Aug. 10, 1887; and was retired at his own request, July 1, 1891. In the volunteer service he was brevetted colonel of the 10th New York Artillery, Jan. 7, 1863, and

honorably mustered out July 6, 1865. He was assistant professor at West Point in 1853-'54; on frontier duty in 1854-'60; during the civil war participated in the campaigns of the Army of the Potomac in 1861-'64; and was brevetted major, in August, 1862, for gallant and meritorious services during the campaign in Virginia, and lieutenant-colonel in June, 1865, for similar services at the siege of Petersburg. After the war he was assistant instructor of artillery tactics at West Point, and served at various posts and stations in 1868-'90. He was a victim of the Park Avenue Hotel disaster in New York city.

Polk, Joseph B., actor, born in Maryland in 1841; died in Baltimore, Md., Jan. 5, 1902. His first appearance was in 1861, under the management of John T. Ford. He began to attract attention when he became a member of Wallack's Theater company, New York, and later he played for a time in Augustin Daly's Fifth Avenue Theater, finally joining the Union Square company, under the management of A. M. Palmer, where he remained for many seasons, making the most distinguished successes of his career. Associated with him were Clara Morris, Charles Thorne, Stuart Robson, Sara Jewett, and other well-known actors. His most artistic impersonations were of genial, humorous old men and strong "character" rôles. After the disbanding of the Union Square Theater company, Mr. Polk went on a successful starring tour in the United States and also in England and Australia, where he became as great a favorite as in his own country. His last appearance was in Salt Lake City, in 1898, in *What Happened to Jones*. At that time he was stricken with paralysis, from which he partially recovered. He then became president of the Chesapeake Brewing Company, of Baltimore, holding that place until his death. He married, in 1867, Julia Parker, daughter of the comedian, Joseph Parker. Mrs. Polk died June 20, 1900.

Poston, Charles D., pioneer, born in Hardin County, Kentucky, about 1822; died in Phenix, Arizona, in June, 1902. He was a native of Kentucky, where he practised law in early life, and afterward in Washington, D. C. In 1854 he went to California as a gold seeker, and remained there till the civil war broke out, when he joined the National army as an aide on the staff of Gen. Heintzelman. After the war he returned to California as Superintendent of Indian Affairs, and while holding this office served also as recorder of the region now embraced within Arizona. He gave Arizona her name in 1863, and secured the organization of the new Territory. In 1864 he was elected the first Delegate to Congress from Arizona. Subsequently he traveled in Europe, and again returned to Arizona, where he held various minor offices. For a time he was connected with several New York papers.

Potter, Edward Eels, naval officer, born in Medina, N. Y., May 9, 1833; died in Belvidere, Ill., Jan. 8, 1902. He entered the navy as midshipman Feb. 6, 1850; was promoted passed midshipman, June 20, 1856; master, Jan. 22, 1858; lieutenant, March 18, 1858; lieutenant-commander, July 16, 1862; commander, March 2, 1869; captain, April 1, 1880; and commodore, June 27, 1893; and was retired May 9, 1895. His first important duty was in conveying the first Japanese embassy home in 1860. At the outbreak of the civil war he was ordered to the Wissahickon, and he served on it during the bombardment and passage of Forts Jackson and St. Philip, and the capture of New Orleans. He also passed the Vicksburg batteries twice, and participated in the engagement

with the Confederate ram *Arkansas*. In 1862 he was attached to the *De Soto*; later to the *Wabash*; and in 1864-'65 had command of the ironclad *Mahopac*. He received command of the *Chippewa* in 1863, and took part in the engagement at Fort Fisher and the bombardment of Fort Anderson. In 1868, while attached to the *Shawmut*, he ascended Orinoco river to Ciudad, Bolivar, and recovered from the revolutionists 2 steamers belonging to an American mercantile company. The seizure of these vessels formed the basis of the celebrated Venezuelan claims, which were settled in Washington in 1895. He was sent to Ireland with the *Constellation* loaded with provisions to relieve the famine of 1880, and later had charge of the *Naval Home* in Philadelphia.

Powell, John Wesley, geologist and anthropologist, born in Mount Morris, N. Y., March 24, 1834; died in Haven, Me., Sept. 23, 1902. His father, a Methodist clergyman, came to this country from England a few months before the birth of his son, and held pastorates in Ohio, Wisconsin, and Illinois. His early schooling was that ordinarily obtained in a rural community, and his scientific bent is said to have been acquired by association with an old friend who directed his attention to natural history.

He studied at Illinois College, and subsequently entered Wheaton College, teaching at intervals in public schools. In 1854 he entered Oberlin, where, for two years, he pursued a special course. As he reached manhood his interest in studies of natural history increased, and he traversed portions of Illinois, Iowa, Missouri, and Wisconsin on foot, making collections of plants, shells, minerals, and fossils, which he placed in institutions of learning in Illinois. The Natural History Society of Illinois elected him secretary and provided him with facilities for carrying on his researches. At the beginning of the civil war he enlisted as a private in the 20th Illinois Regiment, and he received successive commissions until he became lieutenant-colonel of the 2d Illinois Artillery. He lost his right arm at the battle of Shiloh, but soon afterward returned to his regiment and continued in active service until the close of the war. He accepted the professorship of Geology and the curatorship of the museum in the Illinois Wesleyan University, Bloomington, in 1865, which he soon resigned to accept a similar appointment in Illinois Normal University. In the summer of 1867 he organized and led a geological excursion of American students to the mountain region of Colorado, and so began a practise that has since been continued by teachers elsewhere. He remained in the mountains as an explorer after his party had returned home, and in 1868 organized a second expedition with geologic and geographic exploration and research as its chief objects, the necessary funds for which were furnished by educational institutions in Illinois and the Smithsonian Institution. On this expedition he formed the idea of exploring the Grand Cañon of the Colorado, and a year later he organized a party for that purpose. When this work was begun it was known that the Colorado river flowed for 700 to 1,000 miles

through walls 5,000 feet high, mostly unscalable; but the nature of the rapids, cascades, and cataracts in that cañon was altogether unknown. The journey lasted more than three months, and his party passed through numerous perilous experiences, living for a part of the time on half rations. The success of this undertaking resulted in the establishment by Congress, in 1870, of a topographical and geological survey of Colorado river and its tributaries, which was placed under his direction, and for several years thereafter he conducted a systematic survey of the territory until the Colorado valley, embracing an area of nearly 100,000 square miles, was thoroughly explored. This expedition, at first conducted under the auspices of the Smithsonian Institution, was transferred to the Department of the Interior and received the title of the Geological and Geographical Survey of the Rocky Mountain Region. At this time the study of the problem for the utilization of the arid regions of the West through irrigation attracted his attention, and under his direction a special investigation was made of the water-supply of Utah. Meanwhile surveys of the West were in progress under the auspices of Ferdinand V. Hayden, Clarence King, and George M. Wheeler, and their ambition to include the exploration and survey of all of that region led to rivalry, in consequence of which, after much controversy, in 1879, the National Academy of Sciences, to which the matter had been referred, recommended the establishment under the Department of the Interior of an organization to be known as the United States Geological Survey. This at once went into effect, abolishing the Hayden, Powell, and Wheeler surveys, and Clarence King became by presidential appointment the first director of the new survey. In 1881 Mr. King resigned the directorship of the Geological Survey, and Mr. Powell became his successor, continuing at the head of that important work until 1894, when he resigned. During his administration of the survey he abandoned the geographic subdivisions of the work and substituted a classification based upon function, creating divisions of topography, general geography, and economic geology, coordinate with the divisions of paleontology, physics, and chemistry, and carried the work forward until it became recognized as one of the greatest scientific bureaus ever organized. Meanwhile, in 1880, he became interested in ethnology and brought about the founding of the Bureau of American Ethnology, which is regarded as his creation. Work in this branch of science had previously been largely discursive and unorganized, but under his direction definite purposes conformable to high scientific standards were adopted, and he attracted to its corps of investigators men of the highest standing. During the years that he was director of the Geological Survey he continued as the nominal chief of the Bureau of American Ethnology, and in 1892 he returned to the active charge of that bureau, at the head of which he continued until his death. He made important contributions to geology, especially concerning the stratigraphic structure and areal geology of the Colorado plateaus and the Uinta mountains. The scientific study of the arid lands of the West in relation to human industries is due chiefly to Mr. Powell, and his plan for the recovery of the Western arid regions by the impounding of the waters is now universally accepted. Of his work in ethnology the twenty annual reports of the bureau while under his supervision are sufficient testimony. In 1892 the French Academy awarded him the Cuvier annual prize of 1,500 francs.

for the greatest scientific service to the world during the year. This money he promptly returned, with a letter saying that such prizes ought to go to meritorious individuals rather than to governments or government institutions. Many honorary degrees were conferred upon him, including that of Ph. D. from the University of Heidelberg, and that of LL. D. from Illinois Wesleyan, Columbian, and Harvard Universities. In 1880 he was elected to the National Academy of Sciences, and he was president of the Anthropological Society of Washington from its organization in 1879 to 1888; also of the American Association for the Advancement of Science in 1888. He was one of the founders of the Cosmos Club of Washington, and was its first president in 1878. His publications include many scientific papers and addresses, and besides the many Government reports that bear his name, including those of the various geological surveys and the Bureau of American Ethnology, of which he was chief, he was the author of *Exploration of the Colorado River of the West and its Tributaries, Explored in 1869-'72* (Washington, 1875); *Report on the Geology of the Eastern Portion of the Uinta Mountains and a Region of Country Adjacent Thereto* (1876); *Report on the Lands of the Arid Region of the United States* (1879); *Introduction to the Study of Indian Languages, with Words, Phrases, and Sentences to be collected* (1880); *Cañons of the Colorado* (1895); *Truth and Error* (1899); and *Good and Evil*. A meeting in his memory was held in the National Museum, Sept. 26, 1902, when his colleagues expressed their grief at their loss of "a loyal friend and devoted public servant, a daring explorer, and an original contributor to the sum of human knowledge."

Power, Maurice J., jurist and art founder, born in County Cork, Ireland, Oct. 18, 1838; died in New York city, Sept. 8, 1902. He came to the United States with his parents in 1841; learned the trade of stone-cutting; and in 1868 established the National Fine-Art Foundry, which subsequently cast many notable pieces of bronze sculpture, including the battle monuments at Trenton and Monmouth, N. J., Newburg, Albany, and Buffalo, N. Y., Manchester, N. H., and in many other cities in the Middle, Southern, and Western States. Among his other works were the statue of Patriotism in Kingston, N. Y., and the memorial of the capture of Major André at Tarrytown, N. Y. Mr. Power assisted in the formation of the Democratic organization that elected Edward Cooper mayor of New York in 1878, and was a police-court justice in 1880-'90. He was one of the founders of the County Democracy in opposition to Tammany, and was its leader from 1886 till 1890. In 1893 he was appointed United States shipping commissioner for the port of New York, which post he held till 1897, when he was appointed an aqueduct commissioner. He held the latter post till his death.

Pratt, Charles, musician and composer, born in Hartford, Conn., in 1841; died in New York city, Aug. 11, 1902. He was a successful composer of music in Hartford while a very young man, and after some experience there as organist, teacher, and leader of an orchestra, he went to New York and soon made a name for himself as a pianist, conductor, and composer. After a time he became an organizer and manager of concert companies, and was very successful. In this field he was associated at various times with Emma Abbott, Clara Louise Kellogg, Emma Thursby, Ilma di Murska, and other favorite singers. At one time he was chief assistant of Patrick Sars-

field Gilmore in the management of the celebrated Gilmore's Band, and during one season he was musical director for Col. Henry Mapleson, the grand-opera impresario.

Queen, John, actor and minstrel performer, born in New Orleans in 1860; died in New York, Feb. 23, 1902. His first appearance was early in the eighties, when he was the senior member of The World's Trio—Queen, Stowe, and Randall—originators of many new short acts suitable for the variety stage. His ability as a "black-face" comedian was so marked that soon he had no difficulty in finding a place in Haverly's Minstrels, Thatcher, Primrose and West's Company, and all the best of the old-time negro minstrel entertainments. He traveled with one or another of these organizations for many seasons, and was considered one of the best "end-men" in the business. He also composed numerous negro melodies and what are known as "coon songs," some of which gained great popularity. He had a fine voice, and sang with taste and expression.

Rafferty, William A., military officer, born in New Jersey, Feb. 16, 1842; died in San Felipe, Philippine Islands, Sept. 13, 1902. He was graduated at West Point and commissioned a 2d lieutenant in the 6th Cavalry, June 23, 1865; was promoted 1st lieutenant, May 1, 1866; captain, May 14, 1868; major, 2d Cavalry, Nov. 20, 1889; lieutenant-colonel, May 31, 1898; and colonel of the 5th Cavalry, Oct. 18, 1899. He served with distinction in the Indian wars on the frontier, and was brevetted major, United States army, Feb. 27, 1890. He was assistant instructor of cavalry tactics at West Point in 1873-'74.

Randall, Silas Goodyear, inventor, born in Cornwall, Vt., in 1819; died in Providence, R. I., Nov. 21, 1902. He was graduated at Middlebury College and at Andover Theological Seminary; and preached in the Congregational Church in Vermont and in Green, N. Y., till his health failed him, when he gave his attention to inventions, his chief production being the disk harrow.

Rawson, Albert Leighton, author and artist, born in Chester, Vt., Oct. 15, 1829; died in New York city in November, 1902. After studying law, theology, and art, he visited the Orient four times, and in 1851-'52 made a pilgrimage from Cairo to Mecca. He traveled extensively in the United States and Central America. His publications, illustrated by himself, include a Bible Dictionary; History of all Religions; Statistics of Protestantism; Antiquities of the Orient; Vocabulary of the Bedouin Languages of Syria and Egypt; Dictionaries of Arabic, German, and English; Vocabulary of Persian and Turkish Languages; Chorography of Palestine; Historical and Archeological Introduction to the Holy Bible; The Unseen World; Stella, and Other Novels; Bible Handbook; History of the Quakers; History of Mysticism; The Archaic Library; and a translation of The Symposium of Basra. He also executed more than 3,000 engravings.

Reed, Thomas Brackett, statesman; born in Portland, Me., Oct. 18, 1839; died in Washington, D. C., Dec. 7, 1902. He was graduated at Bowdoin College in 1860, taking the prize for English composition, and for the next four years was a teacher, at the same time studying law. On April 19, 1864, he was appointed acting assistant paymaster in the United States navy and assigned to duty on the Sybil gunboat, which patrolled the Western rivers. He was honorably discharged Nov. 4, 1865, and was then admitted to the bar and began practise in Portland. In 1868 he was elected as a Republican to the Maine Legislature, where he almost immediately became

active and influential. He was reelected in 1869, and the next year was elected to the State Senate. That same year he was elected Attorney-General of the State, and in 1874-'78 he was city solicitor of Portland. In 1876 he was elected to Congress, and he retained his seat in that body continuously till he resigned it in the autumn of 1899 and entered upon law practise in New York city. He first attracted special attention in Congress by his speech in April, 1878, against a bill to reimburse William and Mary College for damages sustained in the civil war. He was soon known as a brilliant and powerful debater and a stalwart Republican. When Congress assembled in December, 1889, he was chosen Speaker of the House of Representatives. The Republican majority in the House was small, and the minority attempted to prevent the transaction of business by refusing to answer to their names. Speaker Reed promptly decided that a member who was actually present must be recorded as present, and could not be permitted to prevent a quorum by refusing to vote or answer to his name. This raised an issue that was very fiercely discussed; but the Speaker was sustained in every instance, and future inquiry revealed the fact that the same view was taken by every presiding officer of the parliaments of Europe, with the exception of Portugal; and subsequently, when the Democrats had control of the House of Representatives, the rule established by Speaker Reed was virtually adopted and repeated by them. In his conduct of the business Mr. Reed displayed executive ability of the highest order, and always had command of the House. He was elected to the speakership again in 1895 and 1897. In 1896 he was an aspirant to the Republican nomination for the presidency, and received 84½ votes. Mr. McKinley received 681½, Mr. Quay 60½, Mr. Morton 58, and Mr. Allison 35½. Mr. Reed contributed numerous articles to periodicals and wrote an essay on the art of oratory as an introduction to the volume of Great Orations in the series of the World's Great Books. He was a strong Protectionist, but opposed the expansion policy of the Government in Mr. McKinley's administration. He was a good story-teller and a brilliant after-dinner speaker, and edited a series of volumes of oratory.

Reed, Walter, born in Gloucester County, Virginia, in 1851; died in Washington, D. C., Nov. 23, 1902. He was graduated at the medical department of the University of Virginia, and became an assistant surgeon in the United States army. He was a bacteriologist of the first rank, was Professor of Bacteriology and Pathology in the Army Medical School, and lecturer on these subjects in Columbian Medical College of Washington. In 1893 he was appointed curator of the Army Medical Museum, in Washington.

Renshaw, Joseph Beresford, inventor, born in Dodge Hill, Heaton Norris, England, July 31, 1822; died in Hartford, Conn., May 4, 1902. He settled in New York in 1847, and later removed to Detroit, and became connected with the Michigan Central Railroad as master mechanic. Still later he removed to Cleveland. He patented a new method of doweling for wood and iron patterns, and a low-heat hardening method for increasing the strength of low-grade iron. Among his inventions are the draftsman's divider, a machinist's micrometer depth gage, and a stay-bolt cutter for use in locomotive shops.

Rice, William Henry (William H. Pearl), actor and minstrel performer, familiarly known as "Billy" Rice, died in Hot Springs, Ark., March 1, 1902. He was one of the most famous and popular

of the old-time minstrel performers, and had been before the public more than forty years. He made his first professional appearance in the Varieties Theater, New York, and soon afterward joined Hooley's Minstrels, with which company he remained several years. In 1874 he assumed an interest in Great Adelphi Theater, Chicago, but it was burned the next year, and he returned to traveling companies, appearing again with Hooley's Minstrels, and with Kelly and Leon's Minstrels, the San Francisco Minstrels, Thatcher, Primrose and West's Minstrels, Cleveland's Minstrels, and Haverly's Minstrels. In some of these companies he owned an interest. Mr. Rice's humor was of a peculiarly unctuous kind, and he never failed to win applause and laughter wherever he appeared. He was one of the highest paid performers in his particular kind of work.

Riddle, Albert Gallatin, lawyer, born in Monson, Mass., May 28, 1816; died in Washington, D. C., May 15, 1902. His father removed to Geauga, Ohio, in 1817, where the son studied law, was admitted to the bar in 1840, and practised till 1846. He served in the Legislature in 1848-'49; removed to Cleveland in 1850; was elected prosecuting attorney in 1856; defended the Oberlin slave rescuers in 1859; and was a Representative in Congress in 1861-'63. In the latter year he was appointed consul at Matanzas. He resumed practise in Washington, D. C., in 1864; was elected law officer of the District of Columbia in 1877; and for seven years was head of the law department of Howard University. He wrote *Students and Lawyers*; *Bart Ridgely*, a story of Northern Ohio; *The Portrait: A Romance of Cuyahoga Valley*; *Alice Brand*; *Life of James A. Garfield*; *The House of Ross*; *Castle Gregory*; *Hart and His Bear*; *Sugar-Makers of the West Woods*; *Mark Loan*; *Life of Benjamin F. Wade*; *Recollections of the War Times, 1860-'65*.

Roach, William Nathaniel, legislator, born in Washington, D. C., Sept. 25, 1840; died in New York city, Sept. 7, 1902. He was graduated at Georgetown University; was a clerk in the United States Quartermaster's Department during the civil war; and removed to the site of Laramie, N. Dak., in 1879. He was a Democratic United States Senator in 1893-'99.

Rood, Ogden Nicholas, physicist, born in Danbury, Conn., Feb. 3, 1831; died in New York city, Nov. 12, 1902. He was the son of the Rev. Anson Rood and Aleida Gouverneur Ogden, and was graduated at Princeton in 1852.

He entered the Sheffield Scientific School, then recently organized, where a year later he took his master's degree. In 1854-'58 he studied at the universities of Munich and Berlin, paying special attention to scientific branches. On returning to the United States he was appointed to the chair of Chemistry and Physics

in Troy University, where he remained until 1863, when he accepted the chair of Physics in Columbia, with which institution he continued until his death, becoming in the mean-

while head of the department, and also one of the organizers and a member of the faculty of the School of Mines, now the School of Applied Science, in the university. His original investigations were in the direction of experimental physics, and in that domain he showed great originality and skill. His special studies pertained largely to matters in mechanics, optics, acoustics, and electricity. He was one of the first to apply photography to the microscope, and the first to take binocular pictures with that instrument. His researches on the nature of the electric spark and the duration of the flashes are particularly interesting, involving the determination of much more minute intervals of time than were ever measured before. In 1880 he devised a mercurial air-pump, giving an exhaustion of 10^{-6} of an atmosphere, a degree more nearly perfect than had been secured before. The methods of photometry that he originated and his investigations of phenomena that depend on the physiology of vision are very ingenious; and he was the first to make quantitative experiments on color contrasts. His brilliant work on colors led to his recognition as the first authority on that subject, and in recent years his studies in physiological optics led to his describing a new color system and a photometric method that is independent of color. His last published research was concerning regular or specular reflection of Röntgen rays from polished metallic surfaces. His experiments appear to show that a small percentage of these rays may be reflected from polished surfaces, and that they consist probably of transverse waves, like those of ordinary light, but of shorter length. Prof. Rood painted in water-colors, was frequently represented in the annual exhibitions, and was a member of the American Water-Color Society from its foundation in 1866. He was elected to the National Academy of Sciences in 1865, and in 1867 was a vice-president of the American Association for the Advancement of Science. The degree of LL. D. was conferred upon him both by Princeton and Yale. The results of his many researches are included in about 100 papers that were published in scientific journals both in the United States and abroad, and especially in the *American Journal of Science*. He was the author of *Modern Chromatics* (New York, 1881), a work that, besides presenting the fundamental facts connected with our perception of color, contains the results of numerous original investigations on the subject, and has been accepted as a standard. It is said of him that "he paid little attention to dress and personal adornment, but without any adventitious aid his appearance was striking and drew attention to him as a man of mark. He was absolutely truthful himself, and despised any lack of truthfulness in others; he had the courage of his convictions; he was frank, very frank sometimes, in expressing his opinion of men and things. He made few advances in the way of acquaintance or friendship, and was apt to receive them with reserve. He had warm and devoted friends, and he had acquaintances who had no personal attachment to him; but every one who knew him, or knew of him, respected him and admired his rugged character, his scientific attainments and accomplishments, and his versatility."

Rouss, Charles Broadway, merchant, born in Woodsboro, Md., Feb. 11, 1836; died in New York city, March 3, 1902. He removed with his father to Winchester, Va., where he was in mercantile business till the civil war broke out, when he entered the Confederate army and served through

the war. He then removed to New York city, and in 1875 began business in a small way for himself, and greatly prospered. He made many gifts to Winchester, Va., for public purposes; founded the Confederate Memorial Hall in Richmond and the Physical Laboratory for the University of Virginia; presented to New York city a bronze group representing Washington greeting Lafayette, by Bartholdi; and erected in Mount Hope Cemetery, New York, a monument to the Confederate soldiers there.

Bunkle, John Daniel, educator, born in Root, N. Y., Oct. 11, 1822; died in Southwest Harbor, Me., July 8, 1902. He was graduated at Lawrence Scientific School in 1851; appointed to the staff of *The American Ephemeris and Nautical Almanac*, with which he remained till 1884; and was editor of *The Mathematical Monthly* several years. About 1860, when the Massachusetts Institute of Technology was projected, he was active in interesting the public in the enterprise. He was a member of its first faculty, and, excepting the period 1870-'78, when he was president, was head of the Mathematical Department till his retirement in 1902, when he was made professor emeritus.

Russell, Sol Smith, actor, born in Brunswick, Me., June 15, 1848; died in Washington, D. C., April 28, 1902. At the beginning of the civil war he ran away from home and tried to join the National army at Cairo, Ill., but was rejected because of his youth. After the departure of the troops, whom he had amused with his songs, jokes, and dances, the manager of the Defiance Theater, of Cairo, offered him an engagement, which he accepted, singing and playing in small rôles. After leaving this company he traveled through the smaller Western towns, singing, giving monologues, and playing on various instruments. Later he appeared in larger towns and cities, and after a time he joined the Peake Family of Bellringers, with whom he made extended tours through the United States. He left them to travel with the Berger Company, a similar organization, with which he remained several years. In 1866 he was engaged as low comedian with Ben de Bar's stock company in St. Louis. Here he supported many of the traveling stars of the time and gained his knowledge of dramatic art. He made his first appearance in New York in 1871 at Lina Edwin's Theater, and in 1874 he became a member of Augustin Daly's company. His first appearance as a star in New York was in 1880, in Edgewood Folks, at the Park Theater. He soon became, in his own peculiar style of acting, one of the most popular players in the United States. His favorite rôles were those requiring the utmost simplicity and gentleness, and he acted them with an apparent naturalness that was really the result of an exceedingly artistic and finished method. He was shrewd enough to realize that his talent was confined to this rather limited style, and he adhered closely to it. Although he never became a popular favorite in New York city, he had an immense following in the country, and accumulated a large fortune. His most notable characters were the leading rôles in *Edgewood Folks*, *A Poor Relation*, *The Tale of a Coat*, *Peaceful Valley*, and *A Bachelor's Romance*. In the season of 1899 he produced *The Honorable John Grigsby*, at the Grand Opera-House in Chicago, but he was obliged to close his engagement Dec. 18 on account of illness, and he never acted again. In later years he was a resident of Minneapolis, Minn. His first wife was Louise Berger, and after her death he married a daughter of William T. Adams, the writer known as Oliver Optic.

Ryer, George W., playwright, born in New York about 1845; died in Brooklyn, N. Y., Nov. 20, 1902. He was joint author with his partner, Denman Thompson, of *The Old Homestead*, and afterward wrote *The Sunshine of Paradise Alley*, *Our New Minister*, and *The Two Sisters*.

Sabin, Dwight May, Senator, born in Manlius, Ill., April 25, 1845; died in Chicago, Ill., Dec. 23, 1902. He was brought up on a farm; accompanied his parents to Connecticut in 1857; entered Phillips Andover Academy, but left in 1863 to enter the National army; and resigned after three months' service, owing to impaired health; and received a clerkship in Washington, D. C. In 1869 he settled in Stillwater, Minn., where he became identified with the lumber and railroad interests of that section. He was a member of the State Legislature in 1871-'83; of the United States Senate in 1883-'89; of the National Republican Committee in 1878-'84, serving as chairman in 1882-'84; and was a delegate to the National Republican conventions of 1872, 1876, and 1880.

Salsbury, Nathan, actor and manager, born in Rockport, Ill., in 1845; died in Long Branch, N. J., Dec. 24, 1902. He joined the 15th Illinois Regiment in 1861, and served throughout the war. He then returned to the West, and, having a fine voice and pleasing presence, he decided to become an actor. His first appearance was at Grand Rapids, Mich., in the old burlesque *Pocahontas*. After further experience with small companies, he joined the Boston Museum stock company, with which he remained four years. He then became a member of Hooley's stock company in Chicago, and while there, in partnership with the late John Webster, he devised the plan that brought him prominently before the public and gained him a fortune. This was the organizing of the company known as Salsbury's Troubadours, playing a musical farce-comedy called *Patchwork*, the first production of its kind in this country. He afterward produced several similar plays, and traveled for fifteen years, visiting nearly every English-speaking country in the world. After the disbanding of this company, Mr. Salsbury became a manager of the Barnum and Bailey Circus, and later of the Forepaugh and Sells Circus. In 1883 he met William F. Cody (Buffalo Bill), and with him organized the unique and successful entertainment known as Buffalo Bill's Wild West Show, with which he was thereafter associated as manager until his death.

Sampson, William Thomas, naval officer, born in Palmyra, N. Y., Feb. 9, 1840; died in Washington, D. C., May 6, 1902. He was the eldest son of James Sampson and Hannah Walker, who came to this country from the north of Ireland and settled in Palmyra, where they met and were married. It was from his mother that young Sampson inherited his beauty of face, and from her he first learned to spell out the words in the few books that the humble home afforded. As he grew older he attended the district school whenever he had opportunity, and during vacations aided his father in his daily labor—digging ditches, making drains, spading gardens, and doing odd chores for the more prosperous villagers. During one summer, it is said, he earned a dollar and a half a week by working in a brickyard from six o'clock in the morning until six at night. Meanwhile, his evenings were occupied in reading, and he borrowed as many books as he could, especially those relating to natural science, history, mechanics, and mathematics. While at school he was distinguished by his intense ap-

plication, a trait that followed him throughout life. Through the interest of William H. Southwick, of Palmyra, Congressman Edwin B. Morgan appointed the young man to the Naval Academy, which he entered in 1857. Among his contemporaries at that institution were George Dewey, who was three classes ahead of him, Alfred T. Mahan, who was two classes ahead, and Winfield S. Schley, who was one class ahead; and among his own classmates were Bartlett J. Cromwell, John W. Philip, Henry F. Pickens, and Frederick Rogers. At the academy he devoted

his attention exclusively to routine duties and studies, and became adjutant of the battalion in his senior year, the highest honor possible for a cadet. Admiral Philip is quoted as saying, "No matter what the subject of study was—mathematics, French, moral science, or seamanship—Sampson, with invariable regularity, had the perfect marking in his class standing. I remember well the struggle of the three S's—Sampson, Stewart, and Snell. They fought for first place throughout the course, but Sampson came in ahead. He was graduated number one." Mahan describes his personal appearance at that time as follows: "I should not call him handsome, as I remember him then, though the elements of the singular good looks that he possessed in early manhood were all there—an unusually fine complexion, delicate, regular features, and brown eyes remarkable both in shape and color. The smooth, round face struck me as oversmall, and the beauty which in his prime was thoroughly masculine seemed then wanting in strength—a singular misreading. He had just about as much—or as little—carriage and bearing as the ordinary country lad of his age, emphasized by a loose mixed suit, ready-made and ill-fitting. He owed, therefore, nothing to adventitious external circumstances. The figure, which soon afterward broadened and gathered erectness and firmness, gave then an impression of slowness amounting to fragility. I remember also that his manner in questioning was not only interested, but eager, affecting the play of the face; in this differing from the impression usually conveyed by him in mature life, which was one of too great quiescence." On graduating he was assigned as midshipman to the frigate *Potomac*, and in July, 1862, he was made lieutenant, after which he was appointed to the sailing ship *John Adams*, then used as a practise vessel for cadets. An officer who was then a cadet says of him at that time: "He was never excited and never hurried, and he never seemed to raise his voice, and yet his orders could be heard distinctly by the men at the weather-earring when reefing topsails." In 1864 he returned to the Naval Academy, where he became instructor, but in June of that year was assigned to the ironclad *Patapsco* and ordered to Charleston to join Dupont's fleet, blockading that city. He participated in the attack on Sumter, and later, with the rest of Dupont's fleet, was driven out of the harbor by the fire

of the forts. He had the watch on the turret roof on the night of Jan. 15, 1865, when the *Patapasco* ran into a torpedo that hurled her into the air, and a moment later she sank to the bottom of the harbor with most of her officers and men. Sampson, in jumping to the boarding-netting, was caught by his foot in a mesh, and was dragged down by the sinking ship. Instead of struggling frantically, and thereby tying himself more tightly, he coolly waited his chances, carefully slipped his foot from its entanglement, and was saved. "The day afterward," says Mahan, "he was as unaffectedly, and without effort imperturbed, as though nothing remarkable had occurred." His next assignment was to the Colorado, the flagship on the European station, on which he remained until 1867, meanwhile becoming lieutenant-commander in July, 1866. He then returned to the Naval Academy, where he was made assistant in the department of physics, and in 1869, during the temporary absence of his chief, was head of the department. In 1871 he had special duty on the Congress, and later he served on that vessel on the European station. He was promoted commander in August, 1874, and for a time had the Alert. In the autumn of 1874, for a third time he was sent to the academy, and for four years he was at the head of the department of physics. At the close of his term he went to Separation, Wyo., with the party under Simon Newcomb, to observe the total eclipse of the sun, July 29, 1878. From 1879 to 1882 he commanded the *Swatara* on the Asiatic station, and then returned to Washington, where he was made assistant superintendent of the Naval Observatory. His interest in astronomy was considerable, and his associates say that he spent night after night at the telescope. In 1884 he represented the United States in the International Prime-Meridian Council, held in Washington, which had for its object the fixing upon a common prime meridian and a common system of time. From 1885 to 1886 he was superintendent of the torpedo station at Newport, and he there became familiar with the practical manufacture of high explosives. During this time he was also a member of the Board of Fortifications and Other Defenses for the Coast. In 1886 he was one of the representatives of the United States at the International Marine Conference in Washington. In September, 1886, he returned to the Naval Academy as superintendent, and for four years he had entire charge of its work. His conspicuous fitness for that place was recognized, especially following the incumbency of Admiral Francis M. Ramsey, who had introduced radical and much needed reforms; but he brought to bear upon his work there "the same calm certainty of plan and action which afterward disposed of the Spaniards at Santiago." Prof. Ira N. Hollis has written: "His services in improving the state of training at the Naval Academy can not be overestimated. There were few officers in his squadron (in 1898) who had not met him or served with him in some capacity. It would be difficult to fix the great value of this association during a period when the navy was stripping off its sails and putting on its armor." In his first report as superintendent, he maintained that a practise-ship should be a steam-vessel fitted with the very latest appliances, and not an obsolete sailing vessel or antiquated steam craft. He had long insisted that the studies of the line and engineer corps should be specialized at the end of the third academic year, and in 1889 Congress acted upon his recommendations. The senior class was separated into divisions every year,

and appropriate courses of study were assigned. The work in the succeeding two years of sea duty was also made distinct for line and engineer officers. Target-practise and trials in naval and torpedo tactics were introduced. A better state of discipline was reached, for he would never unbend in matters of discipline, and work at the academy began to move with the machine-like precision and regularity for which Sampson was always known. In his history of the Naval Academy, Park Benjamin says: "When Commander Sampson's tour of duty at the Naval Academy ended there remained little for any one else to do, save to keep the standard of efficiency unimpaired." He was promoted captain in March, 1889, and received command of the *San Francisco*, the first modern steel cruiser, pioneer of the new navy when it was placed in commission, which he then had for two years on the Pacific station. In 1892 he returned to Washington, and was made superintendent of the naval gun factory, and a year later was made chief of the Bureau of Ordnance, which place he held until 1897. Although the building of the gun factory was begun while Sampson was at sea, it was still incomplete when he was placed in charge of it, and under his supervision important improvements were made. Every gun built for the navy from 1893 until the beginning of the Spanish War was designed and constructed under his supervision. When made chief of the Bureau of Ordnance he continued the policy of keeping large reserve supplies of ammunition, for the reason, as he wrote in one of his reports, "not only because at any moment an emergency may arise, making them urgently necessary, but also to prevent the scattering of the skilled labor which has developed this manufacture, and keep occupied plants which were established solely to meet the Government demands." The general adoption of hard-faced armor by naval vessels occurred during his administration of the Bureau of Ordnance; and he introduced the soft cap for armor-piercing projectiles; the use of electric power for operating turrets and ammunition hoists; telescopic sights, and many other important details. It was also during his administration that the smokeless powder was perfected by experiments at the torpedo station in Newport and in the naval proving-grounds, where in rapid-fire guns its ballistic effects and keeping qualities proved equal to powder accepted abroad as satisfactory. In 1895 smokeless powder for 6-pounder rapid-fire guns was by his direction put on board ship. As chief of the Bureau of Ordnance he was also a member of the Advisory Board, and the Board of Construction for Building Vessels from 1892 to 1897, and according to Mr. Stayton, "while he had much to do with the general design of all the ships constructed in that period, he had absolute individual charge of the distribution of the battery armor, the turrets, and the barbettes, which enabled him to carry out his idea of giving to our ships an all-round fire, enabling them to be almost as strong when fighting bows-on as when fighting broadside-on, and in this connection the design and arrangement of the batteries of absolutely every vessel engaged at Santiago (except the *Gloucester*) was Sampson's personal work. He is also entitled to the credit for the preparation of a new drill book and the establishment of a system of target-practise, which included not only drilling of crews, but also the drill and training necessary for bringing individual vessels together. In substance, therefore, it was Sampson who designed and built the guns; designed and built the projec-

tiles; designed and built the armor; placed the batteries upon the ships and superintended their construction; aided in the preparation of the drill book; drilled the crews and the officers; and finally took command of the fleet and fought it through a successful war. When he had completed his term as chief of the Bureau of Ordnance, Secretary Long, who has said of him that at that time "no other man then on the active list of the navy had a higher reputation as an accomplished, efficient, competent, all-round naval officer," offered him the post of chief of the Bureau of Navigation. This appointment he declined, preferring outdoor life and duty, and accordingly was assigned to the battle-ship *Iowa*, which had been placed in commission in June, 1897, and with which he joined the North Atlantic squadron. He continued as senior captain in that squadron, although two days after the destruction of the *Maine*, on Feb. 15, 1898, he was appointed president of a board of inquiry charged with the duty of investigating that disaster. This work included taking testimony at Key West of the survivors of the accident, examining the wreck at Havana, taking testimony there, and carefully investigating all circumstances preceding and succeeding the disaster. (See Message from the President of the United States, transmitting the Report of the Naval Court of Inquiry upon the Destruction of the United States Battle-ship *Maine* in Havana, being Senate Document No. 207, Washington, 1898.) This service was concluded on March 22, and Sampson was about to return to his command, when Admiral Sicard was found by a medical survey to be physically incapacitated for further duty, and as the next ranking officer in the North Atlantic squadron, Sampson was promptly appointed to its command, with the war rank of acting rear-admiral. According to Capt. Chadwick, who commanded the flagship, "no one was more surprised at this than Sampson himself; this I know to be a fact. The captains of the squadron were unanimously wishing that he might be selected, hoping—rather against hope—that the few months intervening until his promotion to the rank of commodore might not stand in the way. Whatever was said in favor of the appointment was not said by Sampson or with Sampson's knowledge." Secretary Long wrote: "Sampson had been senior captain of the squadron during all its evolutions and practise of the previous year. He possessed the confidence of its officers to a very high degree, and was undoubtedly their preference. He was familiar with its details, and he had special experience in training in ordnance. To retain him in command was therefore the best thing to do." Mr. Stayton wrote, referring in all probability to the possible war with England in 1894: "If war must come, and all hoped that it would be averted, our ships must be got in order, and there must be a man to command whatever of battle-front our navy could make. According to very high authority, the President [Cleveland] went slowly down the naval list until his finger rested on a name. 'There is the man,' he said. 'He should be the commander-in-chief of our provisional battle squadron.' The man thus honored was William Thomas Sampson. His name was far down the list. 'I will make him a rear-admiral if it ever comes to the point,' said the President." War was declared by the United States on April 21, and at daybreak the morning following the North Atlantic squadron—the largest ever commanded by an officer of the United States navy—under Sampson, with the *New York* as his flag-

ship, sailed from Key West to blockade the northern coast of Cuba, from Cardenas on the east to Bahia Honda on the west—a coast-line of nearly 120 miles. As the sun rose, the first prize of the war, the *Buenaventura*, appeared in sight and was captured. The blockade had been in operation for a few days only when the Navy Department learned that a Spanish fleet, under Admiral Cervera, consisting of the *Infanta Maria Teresa*, *Almirante Oquendo*, *Vizcaya*, *Cristóbal Colon*, and the torpedo-boat destroyers *Terror*, *Furor*, and *Pluton*, had sailed, April 29, from the Cape Verde Islands, presumably for the relief of Havana. The necessity of discovering and engaging the Spanish fleet as soon as it should appear in American waters became Sampson's principal object. On May 4 he sailed from Key West eastward, and thinking it possible that Cervera had made the harbor of San Juan de Porto Rico, he reached that port on May 12, but not finding the Spanish fleet there, he bombarded the forts, and then returned westward, so as better to intercept the enemy's fleet should Havana be its destination. The information that Cervera was in American waters was received by Sampson on May 14, but it was not until May 20, while at Key West, according to his own account, that he "learned by cable from Havana that Cervera had reached Santiago on the 19th." Admiral Schley, who had command of the Flying Squadron, with the *Brooklyn* as his flag-ship, was at that time on the south of Cuba at Cienfuegos, and Sampson immediately informed him of the reported arrival of Cervera in Santiago, and ordered him to proceed thither if he was satisfied that the enemy was not at Cienfuegos. On May 29 Schley reported that Cervera's fleet was at Santiago, and on June 1 Sampson arrived off that port, and assumed command of the combined fleet, which numbered more than 125 vessels. He established a close and efficient blockade, ordering the harbor to be guarded day and night by the squadrons arranged in a semicircle, 6 miles from the harbor mouth by day and 4 miles by night, and directed that search-lights be thrown upon the entrance at night. His first order was: "If the enemy tries to escape, the ships must close and engage as soon as possible, and endeavor to sink his vessels or force them to run ashore in the channel. It is not considered that the shore batteries are of sufficient power to do any material injury to battle-ships." On June 3 Hobson made his famous attempt to sink the *Merrimac* in the channel at the entrance of Santiago harbor, and thus shut in the enemy, a plan that had been contemplated by Sampson as early as May 27, when he prepared orders to be sent to Schley to obstruct the channel by the sinking of a collier. According to Secretary Long: "His sinking of the *Merrimac* in the channel has been criticized, and yet, had it blocked the channel as intended, the Spanish fleet could never have emerged, and would have become ours without destruction by us." Meanwhile, the blockade continued, with bombardments on the fortifications, June 6 and 16, and on June 21 the troops, under Gen. Shafter, arrived off Santiago, and on the day following were landed at Daiquiri. The actions by the land forces at El Caney and San Juan had driven the Spaniards under Gens. Linares and Toral into the city of Santiago. The time for positive action was rapidly approaching, and Shafter desired the active cooperation of the naval forces for the purpose of making an assault on Santiago. The works at Aguadores were bombarded on July 1, and on July 2 the batteries at the entrance of

the harbor of Santiago were similarly treated. At this time Sampson informed Shafter that it would not be possible to force an entrance into the harbor until the channel should be cleared of mines, a task impossible until the forts guarding the entrance to the harbor could be captured. A meeting had been arranged between the two commanders at Siboney for the morning of July 3, and Sampson, having hoisted the signals "Disregard the action of the commander-in-chief," was on his way to the conference. This order simply meant that the other vessels of the fleet were not to follow him, and did not signify a yielding of the command. Had that been his intention a signal "Second in command take charge," would have been displayed. His own account of the subsequent movements of the New York is: "Shortly before half-past nine we reached a point between 7 and 8 miles east of the Morro. The men were at quarters, and the customary Sunday-morning inspection was proceeding, when I suddenly saw from the quarter-deck a puff of white smoke—not black smoke, as a good many have said—rising above the bluff inside the Morro, as if from the Socapa battery. As I heard no report, I was convinced that the shot was not from the eastern battery, which was directly in the line of vision, for that would have made a loud reverberation. The impression was immediate that Cervera's fleet was coming out. I at once sent to the bridge the order: 'Put the helm aport and turn back immediately,' giving it directly to the officer of the deck, without waiting to send it through the commander, as was the custom. Capt. Chadwick hurried on deck, and, without stopping to consult me, went instantly to the bridge. Before the flag-ship had turned, a Spanish vessel appeared at the entrance, coming out under full steam. I at once sent for the chief engineer and directed him to light all the furnace fires, which he assured me had already been done by order of the commanding officer. At the same time I distinctly saw that all the blockading ships, which a moment before had been at Sunday inspection, were on the move and had opened fire on the enemy." The return was quickly made. Chadwick, who commanded the flag-ship, writes: "We were rapidly coming to the fray. We were close under the batteries, but paid no attention to the shots which came over us. One of the torpedo-boats had now turned, and was evidently heading toward the port. We stood in a little closer to head her off. The farther one at this time got a shot in her boilers from one of our ships, and I shall never forget the wonderful, swift jet of silvery steam, like an ostrich-feather, that leaped 500 feet into the air. Knowing that the Vizcaya and the Colon were still going to the westward, we rushed past the Gloucester and the destroyers, both of which were now clearly out of action. In a few moments we passed the Maria Teresa and the Oquendo. Both showed lurid masses of flame and smoke from the mainmast aft, and the men were dropping over the bows into the water. But we could not stop with an enemy yet unsundered ahead, and quickly coming up with the Indiana, between 10 and 11 miles beyond the port, we signaled her to go back and resume the blockade, lest another Spanish ship might come out of the harbor to annoy the transport fleet." With the Brooklyn, Oregon, and Texas, the New York participated in the chase and surrender of the Colon, which brought to an end the long, tedious, and anxious campaign, and the result was announced to the world in Sampson's message to the department as follows: "The fleet under my command offers

the nation as a Fourth-of-July present the whole of Cervera's fleet." According to Philip: "It was the blockade that made the battle possible. The battle was a direct consequence of the blockade, and upon the method and effectiveness of the blockade was very largely dependent the issue of the battle. It was necessary to have always before the entrance to Santiago harbor a force of ships amply sufficient to cope with the Spanish squadron should it come out to do battle, and it was necessary to have this force so disposed that none of the Spaniards could escape, if that were their object, no matter which direction they should take. Unremitting vigilance by night and by day was an absolute necessity." Says Mahan: "The methods of the Santiago blockade are now commonly understood, but their precise military merit has scarcely been adequately appreciated." It was the genius of Sampson that "compelled the enemy to accept battle on the terms they considered most disadvantageous." Secretary Long is equally emphatic. He writes: "He had been, from the first till after the victory was won, commander-in-chief in command. He was never out of signal distance of his blockading fleet. He was on duty at the eastern end of the fighting line; and had Cervera gone that way, then by that chance he would have been universally acclaimed the foremost figure. Yet, as it was, the plan of battle was not changed; it was fought under his standing order unbroken. Before its smoke was over he had steamed along the whole battle line, firing as he went. He has been censured for the despatch announcing the victory. He did not write it; but he assumed it, for he never shirked a responsibility which he had permitted. If you will read it you will note that the pronoun 'I' is not in it, and also that it is not unlike Gen. Sherman's announcement of the capture of Savannah. It assumes no credit for Sampson, but gives it to the fleet under his command." It seems to be conceded that Sampson's campaign has "come to be regarded as establishing a standard of efficiency in the handling of a squadron in war. There is no question among these experts as to who earned the credit for the victory at Santiago, and there never has been. The man who won the victory was the man whose tireless energy during thirty-nine days and nights of the most daring and successful blockade in naval history had kept the fleet in such a state of preparation that victory was assured at any hour, day or night, of that long period when the Spaniards cared to take the chances of battle." The omission of the name of Schley, who was second in command, from Sampson's official report of the battle, led to an effort by the friends of the former officer to claim for him the actual command of the squadron during the fight, and a bitter controversy ensued, which continued for three years, when Schley asked for a court of inquiry, the verdict of which was against that officer. Schley, in a despatch to Secretary Long, sent a week after the battle, wrote: "Feel some mortification that the newspaper accounts of July 6 have attributed victory of July 3 almost wholly to me. Victory was secured by force under commander-in-chief of North Atlantic station, and to him the honor is due." Concerning this controversy, Secretary Long said: "I can think of nothing more cruel than a depreciation of the merits of the faithful, devoted, patriotic commander-in-chief, physically frail, worn with sleepless vigilance, weighed with measureless responsibilities and details, letting no duty go undone; for weeks, with ceaseless precautions blockading the Spanish squad-

ron; at last, by the unerring fulfilment of his plans, crushing it under the fleet which executed his commands; yet now compelled in dignified silence to be assailed as vindictively as if he were an enemy to his country." Capt. French E. Chadwick, of the United States navy, who was chief of staff to Admiral Sampson, writes as follows and furnishes the accompanying diagram:

appointment as vice-admiral; but for similar reasons this action never was taken, so that Sampson's success at Santiago failed to receive any official recognition from Congress. He received the thanks of the Legislature of New Jersey for his services during the war with Spain, and was presented with a jeweled sword, in honor of his victory at Santiago, by the citizens of his adopted

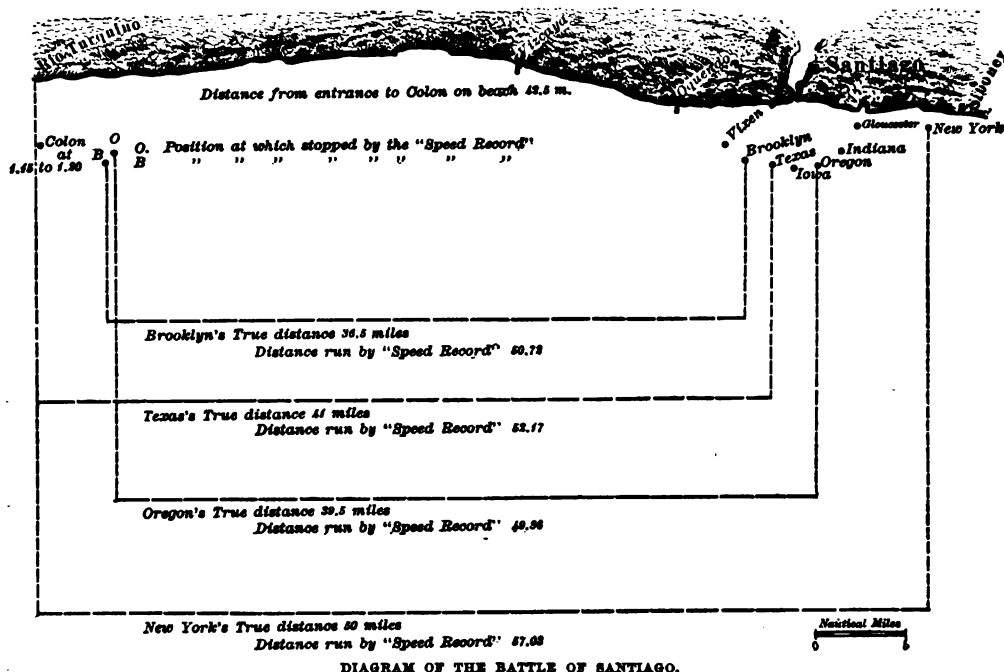

DIAGRAM OF THE BATTLE OF SANTIAGO.

"There is a very curious misconception about the distance of the New York from the squadron when the enemy came out of Santiago July 3d, which ought to be rectified. This, I think, is very important. It should be remembered that the blockading ships were not less than 4 miles from the entrance and ranged approximately in a semicircle, which was from 6 to 8 miles long, as the ships were drifting about and were frequently considerably farther out than this from their appointed stations. When the New York turned, which was at the instant the smoke of the gun which was fired from Socapa battery at the same time the enemy's flag-ship emerged, she was, as near as can be reckoned, 7½ miles from the entrance. The Gloucester was thus but half the distance from the New York that she was from the Brooklyn. The Indiana was nearer to the New York than to the Brooklyn; the Oregon was a trifle nearer to the Brooklyn than to the New York. To say that the New York was absent from the squadron under these circumstances is, of course, absurd." At the close of the war with Spain Admiral Sampson served as one of the commissioners from the United States to arrange the details of the evacuation of Cuba by the Spaniards, and on the completion of this service he resumed command of the North Atlantic squadron. On Aug. 10, 1898, President McKinley recommended that Admiral Sampson be advanced eight numbers for eminent and conspicuous conduct in battle; but, owing to a popular excitement in favor of Schley, Congress failed to confirm this recommendation. It was the intention of the President to present his name for

State. In October, 1899, he was assigned to the command of the Boston Navy-Yard, and he continued in that duty two years. Meanwhile his health, never strong, and probably impaired by the strain of the campaign during the war with Spain, began to fail, and in October, 1901, he was placed on waiting orders. The presidency of the Massachusetts Institute of Technology was offered to him in 1900, but he declined it. Harvard and Yale gave him the degree of LL. D. Sampson was retired from active service Feb. 9, 1902, and thereafter remained in Washington, where he made his home until the end, steadily failing from softening of the brain, which terminated in a cerebral hemorrhage. His death was announced in an order issued by the Secretary of the Navy, in which, after reviewing the principal events in his career and quoting "Let me assure you that I have the highest appreciation of your service as a commander-in-chief of the Atlantic naval forces during the Spanish war, in blockading Cuba, cooperating with the army, directing the movements of the great number of vessels under your orders, and at last, after the most effective preparation, consummating, with the gallant officers and men under your command, the destruction of the Spanish fleet," from President McKinley's letter of March 13, 1899, he closed with the following encomium: "This record of lifelong devotion to duty, with its fruitage of splendid achievement, renders his name illustrious in the annals of the navy and places it high on the roll of those who have deserved well of the republic." His funeral surpassed in pomp and ceremony any similar naval service. At the church every de-

partment of the national Government was represented—the executive by the President and his Cabinet and many officials of the civil service, the legislative by Senators and Representatives, the judiciary by the United States Supreme Court, and the military and naval services by officers of all ranks. Then his comrades, led by Admiral Dewey, laid him to rest at Arlington. In personal appearance Admiral Sampson was slender but straight as a column, and, until illness bent him down, he looked much taller than he was. He never seemed strong, but his constitution was equal to almost any demand upon it. It has been said of him that “he was always dignified and reserved, never pompous or severe. He never cringed to his seniors, and never was familiar with his juniors, though he always recognized their abilities in a quiet way. He never lost his temper or said or did a mean thing in his official life. Sampson was always perfectly cool and imperturbable in a tight place, master of every situation in which he found himself. He was a good disciplinarian; but no naval officer, while maintaining proper discipline, ever said or did fewer harsh things than Sampson. He talked little, and when he spoke it was always in few words and directly to the point. A clearer, more logical mind than his could not be imagined.” Admiral Sampson's first wife was Margaret, daughter of David S. Aldrich, of Palmyra, N. Y. Their children were five daughters: Margaret, who married Lieut. Roy C. Smith of the navy; Catharine, who married Lieut. Richard H. Jackson of the navy; Susan Aldrich, who died in childhood; Hannah, who married Lieut. W. T. Cluverius of the navy; and Olive, who married Lieut. Henry H. Scott of the army. His second wife was Miss Elizabeth Burling, of Rochester, N. Y., by whom he had three sons: William, who died in infancy, Ralph Earle, and Harold Burling.

Saunders, Frederick, librarian, born in London, England, Aug. 14, 1807; died in New York, Dec. 12, 1902. He came to the United States in 1837, and established a branch of his father's London publishing house, for the purpose of issuing American editions of their own publications and to seek the protection of an international copyright law, which failed. Mr. Saunders was for some time city editor of the *Evening Post*. He was widely known in connection with the Astor Library, having been assistant librarian in 1859-'76, and librarian in 1876-'96. He was a frequent contributor to magazines and reviews. His separate publications include *Memoirs of the Great Metropolis*, or London from the Tower to the Crystal Palace (1852); *New York in a Nutshell* (1853); *Salad for the Solitary* by an Epicure (1853); *Salad for the Social* (1856); *Pearls of Thought, Religious and Philosophical*, Gathered from Old Authors (1858); *Mosaics* (1859); *Festival of Song* (1866); *About Women, Love, and Marriage* (1868); *Evenings with the Sacred Poets* (1869); *Pastime Papers* (1885); *Story of Some Famous Books* (1887); *Stray Leaves of Literature*; *Memoirs of the Great Metropolis*; *Character Studies*; *Stories of the Discovery of the New World by Columbus*, etc. He was also editor of *Homes of American Authors* (1853), and, with Henry T. Tuckerman, *Our National Centennial Jubilee* (1877).

Schoeborn, August, architect, born in Germany about 1827; died in Washington, D. C., Jan. 25, 1902. He settled in Wisconsin in 1849, later he removed to Washington, D. C., and entered the office of the architect of the Capitol, where he remained until his death. During the civil war he prepared maps and plans for Gen. McDowell, as

well as plans for forts, barracks, hospitals, etc., for the quartermaster-general's office.

Schuetze, William Henry, naval officer, born in Missouri; died in Washington, D. C., April 4, 1902. He was graduated at the Naval Academy in 1867; entered the navy as cadet midshipman, June 21, 1869; promoted to midshipman, May 31, 1873; ensign, July 16, 1874; master, Nov. 30, 1878; junior lieutenant, March 3, 1883; lieutenant, Oct. 2, 1885; and lieutenant-commander, March 3, 1899. He went on an expedition to the Lena delta, and brought back the bodies of those who perished in the De Long expedition. In 1882 he was sent again to Northern Siberia by the State Department to distribute presents among the natives in return for their kindness to the De Long party. He was on duty at the Navy Department in 1886-'87; and was superintendent of compasses in 1888-'89. During the war against Spain in 1898 he was navigator of the battle-ship *Iowa*, and in 1902 he was on duty at the Bureau of Equipment.

Scott, George Robert White, clergyman, born in Pittsburg, Pa., about 1842; died in Berlin, Germany, Sept. 14, 1902. He studied at Middlebury College and at Andover Theological Seminary, and held pastorates in Congregational churches in Boston, Mass., Newport, N. H., and Fitchburg, Mass. Later he went to Europe to study, and settled in Berlin, where he remained seven years. On his return he became pastor of the First Congregational Church in Leominster, Mass., where he remained till 1896, when he removed to Newton. He was author of *The Italian Renaissance of To-day* and a memoir of Prof. Park, and a contributor to religious periodicals.

Scribner, William Marshall, penman, born in Waterboro, Me., in 1824; died in Chicago, Ill., Jan. 15, 1902. He lived many years in Boston; took an active part in educational work in the West; and became widely known as the author of a system of penmanship copy-books bearing his name.

Scudder, Horace Elisha, author, born in Boston, Mass., Oct. 16, 1838; died in Cambridge, Mass., Jan. 11, 1902. He was graduated at Williams College in 1858; for three years he taught a school in Brooklyn, N. Y., and later edited the *Riverside Magazine for Young People*. On the discontinuance of the magazine he became a member of the publishing house of Hurd & Houghton, but presently retired from the business department to devote himself to literary pursuits. He remained connected with the house after it became the Boston establishment of Houghton & Mifflin, and from 1890 to 1898 was editor of the *Atlantic Monthly*. He wrote much for younger readers, with whom his books were popular, but was also known in the wider field of general literature. His works include *Seven Little People and their Friends* (1862); *Dream Children* (1863); *Life and Letters of David Coit Scudder, Missionary in India* (1864); *The Game of Croquet: Its Appointment and Laws* (1866); *Stories from my Attic* (1869); *Doings of the Bodley Family in Town and Country* (1875); *The Dwellers in Five-Sisters Court*, a novel (1876); *Recollections of Samuel Breck* (edited) (1877); *The Bodleys Telling Stories* (1877); *The Bodleys on Wheels* (1878); *The Bodleys Afoot* (1879); *Stories and Romances* (1880); *Mr. Bodley Abroad* (1880); *Boston Town* (1881); *The Bodley Grandchildren and their Journey in Holland* (1882); *Noah Webster, a biography* (1882); *The English Bodley Family* (1883); *The Viking Bodleys: An Excursion into Norway and Denmark* (1884); *A History of the United States of America*

(1884); *Men and Letters: Essays in Characterization* (1887); *The Book of Folk Stories Rewritten* (1887); *George Washington: An Historical Biography* (1889); *Childhood in Literature and Art* (1894); *The Book of Legends told over Again* (1899); and *James Russell Lowell: A Biography*. He was a frequent contributor to the *Atlantic Monthly*, but the larger part of his work there appeared anonymously.

Seibert, George C., clergyman, born in Wetter Hessa, Germany, Feb. 25, 1828; died at sea, Sept. 9, 1902. He studied in Germany; became a private instructor at Wiesbaden; and for two years was professor at a gymnasium in Bakmen. He then became an instructor in Hagerstown, Md. When the civil war broke out this school was closed, and he became pastor of the Third German Presbyterian Church, in Newark, N. J. In 1868, when the German Theological Seminary was established in Bloomfield, Dr. Seibert became Professor of Systematic Theology and New Testament Exegesis. He was editor of the German *Volksfreund* and of an edition of Schleiermacher's *Doctrine of Sin*, and was author of *Hellenism and Christianity*.

Selfridge, Thomas Oliver, naval officer, born in Boston Mass., April 24, 1804; died in Waverly, Mass., Oct. 15, 1902. He entered the navy as a midshipman Jan. 1, 1818; was promoted lieutenant, March 3, 1827; commander, April 11, 1844; captain, Sept. 14, 1855; and commodore, July 16, 1862; was retired July 25, 1866; and was promoted rear-admiral on the retired list, July 26, 1870. He served in the West Indies, Brazil, and the Mediterranean; was assigned to the *Columbus*, the flag-ship of the East Indian squadron, in 1846; and subsequently to the *Dale*, of the Pacific squadron. He took part in the capture of Matanzas and Guaymas, and at the latter place was wounded so severely as to be unfitted for sea service, and was appointed commandant of the Boston Navy-Yard. In 1861 he received command of the steam frigate *Mississippi*, of the Gulf squadron, but his wound again disabled him for sea service, and he was made commandant of the navy-yard at Mare Island, California. He continued in active duty for several years after his retirement, as commandant at the Philadelphia Navy-Yard in 1867-'68; president of the Examining Board in 1869-'70; lighthouse inspector in Boston; and a member of the Examining Board in 1871. At the time of his death he was the oldest officer on the retired list. His son, Thomas Oliver Selfridge, Jr., also reached the grade of rear-admiral and was placed on the retired list in 1898.

Seward, Theodore Frelinghuysen, musician, born in Florida, N. Y., Jan. 25, 1835; died in Orange, N. J., Aug. 30, 1902. He studied music under Lowell Mason and Thomas Hastings, and became an organist in New London, Conn., in 1856; and in Rochester, N. Y., in 1859. He removed to New York in 1867, where he conducted the *Musical Pioneer* and afterward the *Musical Gazette*. He introduced the Tonic Sol-fa system of musical notation and instruction in the United States and prepared a series of text-books for it; and founded the Tonic Sol-fa Association. He took charge of the concerts of the "Jubilee" singers, and made the tour of Europe with them in 1875-'76. Besides writing on the Tonic Sol-fa system and lecturing before gatherings of teachers, he edited the *Tonic Sol-fa Advocate* and the *Musical Reform*. He was the founder of the American Vocal Music Association; the Brotherhood of Christian Unity (in 1891); the *World's Neighbor-Chain* (in 1898); and the *Don't Worry*

clubs; and was the author of *The School of Life* (1894); *Heaven every Day* (1896); *Don't Worry* (1897); and *Spiritual Knowing* (1900).

Shepherd, Alexander Robey, administrator, born in Washington, D. C., Jan. 30, 1835; died in Batopilas, Mexico, Sept. 12, 1902. He became a clerk in a store in 1848; later was apprenticed to a carpenter; and in 1852 entered a plumbing and gas-fitting concern, of which he subsequently became a partner and the principal. In 1861 he enlisted in the Washington National Rifles, which opened the road by way of Annapolis and brought to Washington the first troops after the Baltimore riots. After his term of enlistment he gave his attention to beautifying Washington. In 1861 he was elected to the Common Council; in the following year was reelected; later became president of the Board of Councilmen; and in 1867 was appointed a member of the Levy Court. In 1870 he was elected president of the Citizens' Reform Association, which organized the forces that defeated the regular Republican nominee for mayor and secured the legislation establishing the Territorial form of government for the District of Columbia, and in 1873 was appointed Governor of the District. He planned and carried out the extensive improvements, especially in the construction of avenues and streets, which transformed the city into a wholesome, beautiful district. Charges of corruption were made against him, and he was derisively spoken of as "Boss" Shepherd. An investigation failed to sustain the charges, but in 1874 Congress was led to pass an act changing the form of government for the Federal District from that of a Territory to one under the direct management of a commission. President Grant nominated Mr. Shepherd for one of the three commissioners, but the Senate refused to confirm him. In 1880 Mr. Shepherd went to Batopilas, Mexico, where he passed the remainder of his life as general manager of a corporation that developed a great silver-mine.

Sigel, Franz, military officer, born in Sinsheim, Baden, Nov. 18, 1824; died in New York city, Aug. 21, 1902. He was graduated at the Military School of Karlsruhe in 1843; served as lieutenant in the German army in 1843-'47; then resigned and studied law. In February, 1848, he joined the Baden revolutionists, and raised a corps of volunteers. He led more than 4,000 volunteers against Freiburg, was defeated twice, and fled to Switzerland. He returned to Baden in May, 1849, fought in several engagements, and rose to the rank of commander-in-chief of the revolution. In 1851 he was arrested by the Swiss authorities, but escaped, first to France and later to England. He settled in New York in May, 1852, where he conducted *Die Revue*, a military magazine, and later in St. Louis, where he edited a similar paper. When the civil war broke out he organized a regiment of infantry and a battery of artillery, which rendered efficient service at the occupation of the arsenal and the capture of Camp Jackson, St. Louis. With this regiment and two batteries he was sent to Rolla, and soon afterward forced the Confederates under Gen. Price to retreat into Arkansas. He was conspicuous in the battles of Carthage, Dug Springs, and Pea Ridge; was commissioned a brigadier-

general of volunteers in May, 1861, and major-general in March, 1862; commanded the 1st Corps of the Army of Virginia in the line of operations beginning with Cedar Creek and ending with Manassas; and in June, 1863, received command of the Pennsylvania Reserves and organized a corps of 10,000 men to aid in repelling Lee's invasion. He fitted out an expedition that operated under Gen. George Crook in the Kanawha valley, and led a smaller one of 7,000 men through the Shenandoah valley against Lynchburg and Staunton, but was defeated by Gen. John C. Breckinridge at Newmarket. He was thereupon relieved of his command, and in June, 1864, was put in charge of the division guarding Harper's Ferry. In May, 1865, he resigned his commission and returned to journalism in Baltimore, where he remained two years, when he removed to New York city, where he resided till his death. He was appointed collector of internal revenue in May, 1871, and elected register of New York city in October following. After the expiration of his term of office as register he lectured, and he was for a time pension agent in New York city. He was the author of essays on military subjects; and during the latter years of his life was engaged in the advertising business and was publisher and editor of the *New York Monthly*, a German-American publication.

Skinner, William, manufacturer, born in London, England, in 1824; died in Holyoke, Mass., Feb. 28, 1902. In 1845 he engaged in the silk business in Northampton, Mass. He became a partner in the firm of Warner & Skinner in 1848; and began business for himself in Williamsburg, Mass., in 1851. His works here were entirely swept away by the great Mill river flood in 1874. In October of the same year he began again in Holyoke. He built a gymnasium for Dwight L. Moody's school in Northfield, Mass.; was a frequent benefactor of Vassar, Smith, and Mount Holyoke Colleges; and was president of the Manufacturers' Association of Holyoke and of the local city hospital.

Smith, Charles Henry, military officer, born in Hollis, Me., Nov. 1, 1827; died in Washington, D. C., July 17, 1902. He was graduated at Waterville College (now Colby University) in 1856; taught for a short time; and then studied law. He entered the volunteer service in the civil war as captain in the 1st Maine Cavalry Oct. 19, 1861; was promoted major, Feb. 16, 1863; lieutenant-colonel March 1 following; and colonel June 18; and was brevetted major-general of volunteers March 13, 1865. After the war he entered the regular army as colonel of the 28th Infantry; was transferred to the 19th Infantry March 15, 1869; and was retired from active service Nov. 1, 1891. During the civil war he took part in 63 engagements, and was wounded three times. He received his brevet of major-general of volunteers for gallant and meritorious services during the war; that of brigadier-general, United States army, March 2, 1867, for similar services at Sailor's Creek, Virginia, and that of major-general, United States army, the same day for gallant services during the war.

Smith, James B., actor and theatrical manager, born in Schenectady, N. Y., in 1846; died in New York, Jan. 28, 1902. He made his first appearance when he was twenty-one years old, and for many years played humorous rustic characters with great success. He originated and acted numerous roles of this kind, and took a prominent part in the first production of *The County Fair*. In the days of the old stock companies he often appeared as Ezekiel Homespun in *The Heir*

at Law, and for several seasons he acted in Hoyt's *A Milk-White Flag*, besides playing leading eccentric comedy characters in many other companies. But although he achieved distinction as an actor, it was as a manager that he became most prominent in the theatrical world. In 1882 he took Barton Hill and Josephine Cameron on an extended tour of the West Indies with great pecuniary success. Returning to New York from this trip, he engaged the late John E. Owens for a starring tour of thirty-six weeks, at a salary of \$350 a week, in a play called *Cook's Corners*, written by Mr. Smith himself. This play was not successful, and as soon as the enterprising manager realized that it was a failure, he promptly revived several of Mr. Owens's famous old plays—*Solon Shingle*, etc.—and through their popularity and his own good management he closed the season with a profit. Mr. Smith was the discoverer of Sissieretta Jones, the negro soprano known as the *Black Patti*. He met her shortly after the conclusion of his tour with John E. Owens, while he was organizing a company of negro singers for a West Indian tour. Miss Jones applied for an engagement, and when he heard her remarkable voice he realized that he had made a valuable discovery and immediately engaged her. He gave a private concert at Wallack's Theater, New York, that the best critics of music might hear her sing. The concert was a great success, as was also the tour in the West Indies.

Spalding, John Franklin, clergyman, born in Belgrade, Me., Aug. 25, 1828; died in Erie, Pa., March 9, 1902. He was educated at Bowdoin College, and after studying for the Episcopal ministry in the General Theological Seminary in New York city was admitted to the priesthood in 1858. He served as missionary at Oldtown, Me., in 1857-'59, and was rector of St. George's parish, Lee, Mass., in 1859-'60. He was an assistant at Grace Church, Providence, R. I., in 1860-'61, and for a short time at St. John's Church in the same city. From 1862 to 1873 he was rector of St. Paul's Church, Erie, Pa., and in December, 1873, was consecrated bishop of what was then the missionary diocese of Colorado. On the organization of the diocese, in 1887, he continued in office as bishop. He was a forceful, active man, with great abilities as an organizer, and under his administration the diocese of Colorado has prospered greatly. Bishop Spalding's writings include *Modern Infidelity* (1862); *A Manual for Mothers' Meetings* (1871); *The Cathedral System* (1880); *The Higher Education of Women* (1886); *The Catholic Church and its Apostolic Ministry* (1887); *The Threefold Ministry of the Church of Christ* (1889); *The Pastoral Office* (1889); *The Best Mode of Working a Parish* (1889); and *Jesus Christ the Proof of Christianity* (1890).

Spear, James, manufacturer, born in Mauch Chunk, Pa., Feb. 17, 1827; died in Wallingford, Pa., Jan. 30, 1902. He removed to Philadelphia in 1848, and engaged in the manufacture of stoves. He patented many inventions, among them the anticlinker grate, which is now in general use; and also made the first successful car-heater, which is used on the principal railroads in the United States. He took an active interest in the Blind Men's Home; was one of the incorporators of the Hayes Mechanics' Home; and aided many institutions, especially the University of Pennsylvania.

Spencer, Lily Martin(e), painter, born in southern France, Dec. 10, 1811; died in New York city, May 22, 1902. She was of French parentage,

came to the United States when five years old, and settled in Marietta, Ohio. While still a young girl she showed such a marked talent for art that Nicholas Longworth, of Cincinnati, offered to send her abroad to study, but her parents

refused the proposition because Mr. Longworth insisted that she should study from the old masters and abstain from all original work for a period of years. On her marriage to the late Benjamin Spencer she removed to New York city, where, under the patronage of Mr. Longworth, she opened her first studio. For many years she had a studio in Newark, N. J.,

and after the Centennial Exposition she removed to a beautiful spot overlooking the Hudson, with the foothills of the Catskill mountains in the distance. Her early painting included the Height of Fashion and The Height of Might, both of which were engraved by Schaus and had a large circulation. Other works were Old-Time Music and The Greek Slave. Her most ambitious completed painting was an allegory entitled Truth Unveiling Falsehood, which won a gold medal at the Centennial Exposition in 1876. She painted portraits of Martin Van Buren, Stephen A. Douglas, and Gen. Grant, McClellan, and Sherman, and a few minutes before her death she was putting the finishing touches on a portrait of the late Robert G. Ingersoll. Notwithstanding her advanced age, Mrs. Spencer had sketched out a work designed to be the largest and most striking of all her artistic efforts. It was to symbolize the Nineteenth Century, and was planned to show about 200 life-size portraits of the most distinguished persons of that period. She spent the greater part of her later years in her beautiful home on the Hudson. The accompanying portrait is from a photograph of a clay bust made by her daughter, the only likeness of the venerable painter in existence.

Sprague, Amasa, manufacturer, born in Cranston, R. I., about 1823; died in Coneset Heights, R. I., Aug. 4, 1902. He was employed in his father's calico-print factory till 1845, when, with his brother William, he assumed the management of the business, and in a short time the brothers had three plants in Rhode Island, one in Baltic, Conn., and another in Kennebunk, Me. The elder Sprague was the first to manufacture calico prints in the United States. The Sprague brothers also organized the Rhode Island Frear Stone Company for the manufacture of artificial sandstone. In 1873 business reverses occurred, and the great calico plants passed into other hands.

Stanley, David Sloane, soldier, born in Cedar Valley, Wayne County, Ohio, June 1, 1828; died in Washington, D. C., March 13, 1902. He was descended on his father's side from Nathaniel Stanley, who served as a private in the Lexington Alarm, and on his mother's side from Conrad Peterson, who was a private in the Virginia Continental line. In 1848 he was appointed from Ohio to the United States Military Academy,

where he was graduated in 1852, entering the army as 2d lieutenant in the 2d Dragoons and serving in the cavalry on the Western frontier until 1861, when he was made captain. Owning to his Virginia ancestry, he was offered a high commission in the Confederate army, but this he promptly declined. His first service was in Missouri, where he gained the appointment of brigadier-general of volunteers on Sept. 28, 1861. Gen. Stanley took part in the successful operations against Island No. 10 and New Madrid, was in the siege of Corinth, the battle of Farmington, and the battle of Iuka, and became chief of cavalry of the Army of the Cumberland in November, 1862. He participated in the battle of Stone River, receiving the brevet of lieutenant-colonel, U. S. A., for his services on that occasion, and was promoted to major-general of volunteers. He also participated in the Middle Tennessee campaign, and was active throughout the Atlanta campaign, being in all the principal battles of that movement, including Kenesaw Mountain, the siege of Atlanta, and the attack on Jonesboro, where he commanded the 4th Army Corps. On Oct. 6, 1864, during the absence of Gen. Thomas, he was assigned to the command of the Army of the Cumberland, and by his energy and skill did much for the successful defense of Nashville, also participating in the engagement at Spring Hill, where he repelled three desperate assaults of the Confederate cavalry and infantry, and in the battle of Franklin, where, after the Union line had been broken and defeat was threatened, he led a charge that resulted in the recovery of the ground that had been lost. Although severely wounded, he refused to leave the field until the battle was won, and for his services on that occasion he received the medal of honor and the brevet of major-general in the regular army. During the remainder of the civil war he was incapacitated for further services by his injuries, and on Feb. 1, 1866, was mustered out of the volunteer service, and made, on July 28, colonel of the 22d Infantry. His subsequent service was in the West, where he participated in campaigns against the Indians. On March 24, 1884, he was promoted brigadier-general, and soon afterward was made commander of the Department of Texas, where he remained until June 1, 1892, when he was retired. Subsequently, from 1893 to 1898, he was governor of the Soldiers' Home in Washington. Gen. Stanley was president of the Society of the Army of the Cumberland, and of the Army and Navy Club of Washington, and a member of the Society of the Sons of the American Revolution.

Stanton, Elizabeth Cady, reformer, born in Johnstown, N. Y., Nov. 12, 1815; died in New York city, Oct. 26, 1902. She was the daughter of Daniel Cady and widow of Henry B. Stanton. (For a sketch of Mr. Stanton's life, see Annual Cyclopædia for 1887, page 613.) She was graduated at Johnstown Academy and at Emma Wil-

lard's Seminary in 1832, and was married in 1840. In 1846 she removed to Seneca Falls, N. Y., and two years later she issued a call for the first woman's congress and began the woman-suffrage movement. She addressed the New York Legislature on the rights of married women in 1854, and in advocacy of divorce for drunkenness in 1860. In 1866, believing women to be eligible for public office, she offered herself as a candidate for Congress. For twenty-five years she annually addressed a congressional committee in favor of an amendment to the Federal Constitution granting enlarged privileges to women. Mrs. Stanton was president of the National Woman

Suffrage Association in 1865-'93, and honorary president of the Woman's Loyal League in 1861. In 1868, with Susan B. Anthony and Parker Pillsbury, she established a periodical entitled *The Revolution*, which was discontinued a few years later. Among her publications were *The History of Woman Suffrage* (with Susan B. Anthony and Matilda Jos-

lyn Gage); *Eighty Years and More* (1895); and (with others) *The Woman's Bible* (1895).

Steele, George McKendree, clergyman, born about 1815; died in Kenilworth, Ill., Jan. 14, 1902. He held pastorates in the Methodist Episcopal Church in Fitchburg, Lowell, Lynn, and Boston; joined the New England Conference of that Church in 1853; became president of Lawrence University, Appleton, Wis., in 1865, with which he remained till 1879, when he went as principal to Wesleyan Academy, Wilbraham, Mass. He held the latter post till 1892, when he resigned and retired.

Stevens, Benjamin Franklin, bibliographer, born in Barnet, Vt., Feb. 19, 1833; died in London, England, March 5, 1902. He went to London in 1860 to join his brother Henry in the bookselling business, in which he was engaged till his death. He was occupied thirty years in making a chronological index of American documents in England, France, Holland, and Spain from 1763 to 1784; also securing facsimiles of many rare and important manuscripts relating to American history. He, too, devoted much time to the compilation of unpublished manuscripts pertaining to the American Revolution. He was purchasing agent for many American libraries; United States despatch agent in London; fellow of the Society of Antiquaries; a member of the Société d'Histoire Diplomatique; honorary member of the Connecticut, New Hampshire, Maryland, Minnesota, and Vermont Historical Societies; and was intimately associated with other similar organizations.

Still, William, abolitionist, born in Shamong, N. J., Oct. 7, 1821; died in Philadelphia, Pa., July 14, 1902. He was of African descent; removed to Philadelphia in 1844; and became a clerk in the office of the Pennsylvania Antislavery Society in 1847. He sheltered the wife, daughter, and sons of John Brown while the latter was awaiting execution. He was chairman and corre-

sponding secretary of the Philadelphia branch of the underground railroad in 1851-'61; and after the civil war wrote the narratives of escaped slaves, which constitute the only full account of this organization. He was appointed post sutler at Camp William Penn for colored troops during the civil war, and in 1885 was sent by the Presbytery of Philadelphia as a commissioner to the General Assembly at Cincinnati. He was one of the original stockholders of the Nation, a member of the Board of Trade of Philadelphia, a member of the Freedmen's Aid Union and Commission, vice-president and chairman of the Board of Managers of the Home for Aged and Infirm Colored Persons; and author of *The Underground Railroad*; *Voting and Laboring*; and *Struggle for the Rights of the Colored People of Philadelphia*.

Stockton, Francis Richard, author, born in Philadelphia, Pa., April 5, 1834; died in Washington, D. C., April 20, 1902. He was graduated at the Central High School, Philadelphia, in 1852, and became a draftsman and engraver. In 1866 he invented and patented a double graver. Turning from his first profession to journalism, he joined the staff of the Philadelphia Post, and in 1870 that of the newly established *Hearth and Home* in New York. A little later he was on the staff of *Scribner's Monthly*; and when *St. Nicholas* was established, in 1874, he became its assistant editor, in which chair he remained for several years. His earliest writings were fanciful stories for children, contributed to the *Riverside Magazine* and other periodicals, and his first publication in book form was a collection of these with the title *Ting-a-Ling Stories* (1870). He soon made a reputation as a writer of humorous stories, his first success for older readers being the *Rudder Grange Stories* (1879). The complete list of his published books is as follows: *The Ting-a-Ling Stories* (1870); *Roundabout Rambles* (1872); *What Might Have Been Expected* (1874); *Tales out of School* (1875); *Rudder Grange* (1879); *A Jolly Fellowship* (1880); *The Floating Prince* (1881); *The Story of Viteau* (1884); *The Lady or the Tiger, and Other Stories* (1884); *The Late Mrs. Null* (1886); *The Christmas Wreck, and Other Stories* (1886); *The Casting away of Mrs. Lecks and Mrs. Aleshine* (1886); *The Hundredth Man* (1887); *The Bee Man of Orn, and Other Fanciful Tales* (1887); *The Dusanter* (1888); *Amos Kilbright, and Other Stories* (1888); *Ardis Claverden* (1889); *The Great War Syndicate* (1889); *The Stories of the Three Burglars* (1889); *The Merry Chanter* (1890); *The Squirrel Inn* (1891); *The House of Martha* (1891); *The Rudder Grangers Abroad, and Other Stories* (1891); *Kobel Land* (1891); *The Clocks of Rondaine* (1892); *The Watchmaker's Wife, and Other Stories* (1893); *Fanciful Tales* (1894); *Pomona's Travels* (1894); *The Adventures of Captain Horn* (1895); *A Chosen Few* (1895); *Stories of New Jersey* (1896); *Mrs. Cliff's Yacht* (1896); *Captain Chap or the Rolling Stones* (1896); *A Story-Teller's Pack* (1897); *The Great Stone of Sardis* (1897); *The Girl at Cobhurst* (1897); *The Associate Hermits* (1898); *The Vizier of the Two-Horned Alexander* (1899); *The Young Master of Hyson Hall* (1899); *Afield and Afloat* (1900); *A Bicycle of Cathay* (1900); *Kate Bonnet* (1902); and *John Gayther's Garden, and the Stories Told Therein* (1902). He left an unpublished novel entitled *The Captain's Tollgate*. His most original creation is *The Lady or the Tiger*, the title of which has become almost proverbial. This story was dramatized as a comic opera and produced with success on the New

York stage in 1888. All Stockton's stories are marked by a quaint humor that is peculiarly

CLAYMONT.

his own. He was a skilful and accomplished editor and a most genial companion. His every impulse was kindly, every opinion or criticism appreciative; and his conversation abounded in the same humor that secured popularity for his published work. He lived several years near Morristown, N. J., but a few years ago bought a fine old place, Claymont, in Jefferson County, West Virginia, and made it his home. For portrait, see frontispiece.

Stoetzer, Wilhelm, soldier, born in Allstedt, Germany, about 1843; died on Governor's island, New York, April 20, 1902. He was educated at Leipzig; joined the Prussian army for service in the war against France, and participated in numerous engagements, including Metz, Worth, Sedan, and the siege of Paris. After the war he came to the United States and enlisted in the regular army; and was assigned to the 12th Infantry. He remained in the army till his death. He was also a distinguished linguist and musician, and was the official interpreter of every command to which he was attached while in the American army.

Stromberg, John, musician, composer, and orchestra leader, born in Prince Edward Island in 1860; died in Freeport, Long Island, July 5, 1902. At a very early age he showed marked talent for composing music, and received a thorough musical education. He traveled several seasons in Canada with various theatrical companies, and then came to the United States, leading orchestras in theaters in different cities and composing many songs that caught the public fancy. In 1896, after finishing a long engagement as orchestra leader for Andrew Mack, the singing Irish comedian, he became the musical director at the famous vaudeville theater of Weber and Fields in New York city. Here, with an extraordinarily fine company to bring his songs before the public, he composed all the music for the brilliant burlesques given at that theater. None of his compositions failed to achieve success, and soon after they were heard in New York they were played, sung, and whistled all over the country, so great was their peculiar charm.

Swayne, Wager, military officer, born in Columbus, Ohio, Nov. 10, 1834; died in New York city, Dec. 18, 1902. He was graduated at Yale University in 1856; studied at the Cincinnati Law School; was admitted to the bar in Ohio and began practice in Columbus. At the outbreak of the civil war he raised the 43d Ohio

Infantry and was made its major; was promoted lieutenant-colonel, Dec. 14, 1861; colonel, Oct. 18, 1862; brigadier-general, March 8, 1865; major-general, June 20, 1865; and was mustered out Sept. 1, 1867. After the war he was transferred to the regular army, and was commissioned colonel of the 45th Infantry, July 11, 1870. He served under Gen. Sherman in the Atlanta campaign, and at Salkahatchie, S. C., he received a wound that caused the amputation of his leg. Shortly after the war he was made Military Governor of Alabama. He established the first school for negroes in the South at Talladega. After his retirement from the regular army he returned to Ohio and practised law in Toledo till 1880, when he removed to New York city, where he formed the firm of Dillon & Swayne, which later became Swayne & Swayne. He was for many years general counsel for the Western Union Telegraph Company, the Wabash Railway Company, the Associated Press, and other corporations.

Thompson, Hugh Miller, Episcopal clergyman, born in County Londonderry, Ireland, June 5, 1830; died in Jackson, Miss., Nov. 18, 1902. He removed with his parents to the United States in 1836, received a common-school education obtained in Caldwell, N. J., and was graduated at Nashotah Theological Seminary in 1852, and was ordered priest in 1856. He was successively in charge of Grace Church, Madison, Wis., and Church of the Nativity, Maysville, Ky., and after his ordination to the priesthood was rector of St. James's Church, Portage, Wis., 1858-'59; St. Matthew's, Kenosha, Wis., 1858-'59; Grace Church, Galena, Ill., 1859-'66; assistant rector of St. Paul's Church, Milwaukee, 1866-'70; rector of St. James's Church, Chicago, 1870-'71; Christ Church, New York city, 1871-'75; Trinity, New Orleans, 1875-'83. In addition to the duties of his profession he was Professor of Church History at Nashotah Seminary, 1860-'70, and for seven years editor of the Church Journal, in New York, continuing his editorial labors after removing to New Orleans. In 1883 he was consecrated bishop-coadjutor of Mississippi, and he became bishop of that diocese on the death of Bishop Green in 1887. He attended the Lambeth Conference in 1888, and preached in St. Paul's Cathedral, Westminster Abbey, and before Oxford University. His published books include *Unity and its Restoration* (1860); *Sin and its Penalties* (1862); *First Principles* (1868); *Absolution* (1872); *Copy*, a very popular collection of editorial papers (1872); *Is Romanism the Best Religion of the Republic* (1873)?; *The World and the Logos* (1886); *The World and the Kingdom* (1888); *The World and the Wrestlers* (1895); *The World and the Man*; *More Copy* (1897). Many sermons by him were issued separately, and he often contributed to pamphlet controversy.

Torrey, Henry Augustus Pearson, educator, born in Beverly, Mass., Jan. 8, 1837; died there, Sept. 20, 1902. He removed to Burlington, Vt., in boyhood, and was graduated at the university there in 1858. He was graduated at Union Theological Seminary, New York, in 1864, ordained in 1865, and became pastor of the Congregational church in Vergennes, Vt. In 1868 he was made Professor of Intellectual and Moral Philosophy in the University of Vermont, and he occupied that chair continuously thirty-four years, being at the time of his death, in point of service, the oldest member of the faculty. From 1888 to 1893 he had charge of the university library. He received the degree of LL. D. in 1896. He contributed to the *Andover Review* a series of articles on *The Theodicee of Leibnitz* (1885) and

published *The Philosophy of Descartes* (1892). He was a fine English scholar, a graceful public speaker, had a gift of quiet humor, and invariably won the love of his pupils by his serene temper and sympathetic instruction. The periodical published by the undergraduates of the university says of him: "He wore his learning and his honors so modestly; he was so gracious and cordial, without losing the dignity which was natural to him; his personality in all ways was so attractive and inspiring, that his going from among us begets no ordinary sense of loss. His ripe and accurate scholarship, his power of logical analy-

sis and construction, his courtesy in discussion, his wisdom in counsel, the serene poise of his whole character, mental and moral, gave him a standing among us which would be claimed for no other member of the teaching staff, and made us all—faculty and students—proud of our ranking professor, and glad to work with and under him. Everybody

appreciated the transparent and strong, yet always graceful, English in which his thoughts were clothed, and not less the quiet humor whose lambent gleams were seldom intermitted for long."

Urso, Camilla, violinist, born in Nantes, France, June 13, 1842; died in New York, Jan. 20, 1902. She was the daughter of Salvatore Urso, a Sicilian flautist and organist of considerable renown, and early showed her inherited love of music. When she was six years old she expressed a wish to learn to play the violin, and a year later she made her first appearance as a soloist at a concert. Her success was instantaneous, and she was hailed as a prodigy. She entered the Paris Conservatoire, where she studied three years, practising ten hours a day. After leaving the Conservatoire, she played in concerts in Paris at the Salle Herz, and before the Société Polytechnique and the Association of Musical Artists. She was then eleven years old, and her remarkable performances aroused the greatest admiration and curiosity among musicians and critics and the public in general. In 1852 the young virtuosa came to this country and appeared under the auspices of the Germania Society, creating a great sensation in musical circles. The next season she played in six of Mme. Alboni's concerts, and in December, 1853, she became the violin soloist of Mme. Sontag's concert company. Camilla Urso married Frederic Luere before she was twenty years old, and for several years did not appear in public. In 1863 she played at a Philharmonic concert in New York, and so enthusiastic was the greeting she received that she decided to continue her professional career. She made a tour of the world, winning admiration and exciting wonder wherever she appeared, and was considered the most wonderful woman violinist that ever had been heard. At her funeral the famous violin of the great artist was placed upon the coffin.

Victor, Mrs. Frances Auretta (Fuller) (Barrett), poet and historical writer, born in Rome,

N. Y., May 23, 1826; died in Portland, Ore., in November, 1902. She began to write for the newspapers at the age of fourteen, and her latest publication, a volume of poems, was issued in 1900. She was educated at a seminary in Wooster, Ohio, and with her younger sister, Metta Victoria, published in 1851 *Poems of Sentiment and Imagination*, with *Dramatic and Descriptive Pieces*. She married Judson Barrett, of Michigan, in 1853, who died a few years later, and in 1862 she married Henry Victor, an engineer in the United States navy, a brother of her sister's husband. After this second marriage Mrs. Victor removed to the Pacific coast. Her pen had been laid aside for several years prior to this event, but she now resumed it, contributing to the newspapers of San Francisco and Sacramento, as well as to the *Overland Monthly* from its start. Mrs. Victor was the author of *The River of the West* (1865); *Life and Adventures in the Rocky Mountains and Oregon* (1870); *All over Oregon and Washington* (1870); *The New Penelope and Other Stories* (1877); and chapters on Oregon and other States to Bancroft's *Pacific Coast Histories*.

Wallace, Martin Reuben Merritt, jurist, born in Urbana, Ohio, Sept. 29, 1829; died in Chicago, Ill., March 6, 1902. He was graduated at Rock River Seminary, studied law, and was admitted to the bar in Ohio in 1859, when he removed to Chicago to practise. In 1861 he was commissioned major of the 4th Illinois Cavalry, was promoted lieutenant-colonel and colonel, served at Forts Henry and Donelson and at Shiloh and Corinth, and at the close of the war was brevetted brigadier-general of volunteers. In the war he was offered a bribe of \$100,000 "to take his men on a scout," which meant permitting the bringing into the Union lines of a quantity of cotton for speculators. The suggestion was denounced with characteristic vehemence. After the war he returned to Chicago and was appointed assessor of internal revenue. While he held this office the whisky men offered him \$20,000 a month, to be paid privately to his wife, "as long as he would keep his eyes shut." When his most intimate friend was made acquainted with the intended corruption and asked him what course he intended to take, he replied, "I am going to look." In 1868 he was elected county judge, and he held that post eight years; later he became attorney for the county board, and was United States jury commissioner forty years, and police magistrate thirteen years.

Ward, John Elliott, diplomatist, born in Sunbury, Ga., Oct. 2, 1814; died in Dorchester, Ga., Nov. 30, 1902. He entered Amherst College in 1831, but left on account of the indignation there manifested against Virginians after the imprisonment of two Cherokee missionaries. He then studied law and was admitted to the bar in Savannah. He was solicitor-general of the Eastern District of Georgia in 1836-'38; United States district attorney for Georgia in 1838; member of the Georgia Legislature in 1839, 1845, and 1853, being speaker in the latter year; mayor of Savannah in 1854; president of the National Democratic Convention that met in Cincinnati in 1856; Lieutenant-Governor of the State and president of the State Senate in 1857; and United States minister to China in 1858-'61. In the latter year he resigned in consequence of the adoption by Georgia of the ordinance of secession, although he was strongly opposed to that measure. In January, 1866, he removed to New York city.

Warden, David Adams, musician, born in the Tower of London, England, in 1815; died in Philadelphia, Pa., Feb. 4, 1902. In his early years

he was organist in several Protestant Episcopal churches. He composed a book of chants which attained considerable popularity, and also the music for many patriotic songs that were sung by both armies during the civil war, among them *The Flag's come back to Tennessee*. He also wrote the words and music of *Mother, Don't Weep for your Boy*, and music for *Tell me, ye Winged Winds*.

Warren, George William, organist and composer, born in Racine, Wis., in 1829; died in New York, March 16, 1902. He showed great ability in music from an early age, and when he was twenty-three years old he obtained the place of organist at St. Peter's Protestant Episcopal Church in Albany, N. Y. Later he became the organist at St. Paul's Church, in the same city. He went to New York in 1870, and soon entered St. Thomas's Protestant Episcopal Church as organist, remaining there until 1900. He was a composer of hymns and anthems that came into wide use in churches of many denominations, besides considerable secular music that also won popularity. In 1887 he received the degree of doctor of music from the University of Leipsic. A special commemorative service was held in his honor at St. Thomas's on the completion of his twenty-fifth year as organist of that church, and in 1900, after thirty years' service, he retired as "organist emeritus" from the place he had held so long. He was also Professor of Music at Columbia University, New York, for many years.

Wenckebach, Carla, educator, born in Hildesheim, Germany, Feb. 14, 1853; died in Boston, Mass., Dec. 29, 1902. She was educated at the Girls' High School in Hildesheim, the Normal School at Hanover, and the universities of Zurich and Leipsic; taught in England, Belgium, Russia, and New York; and became Professor of German in Wellesley College in 1883, which post she held till her death. She was one of the most distinguished German instructors in the United States, and had won a high reputation as teacher, editor, and author. With her sister, the late Helen W. Wenckebach, she was author of several educational books on the German language, and was editor of German literary works, including a collection of the best German songs. Among her works were *Deutsche Grammatik* (with Josepha Schrakamp, 1884); *Deutscher Anschauungs-Unterricht* (with her sister, 1886); *Deutsches Lesebuch* (with her sister, 1887); *Deutsche Literaturgeschichte* (1890); *Deutsche Sprachlehre* (1896); *German Composition* (1899); etc. She was editor of *Die schönsten deutschen Lieder* (with her sister, 1885); *Meissner's Aus meiner Welt* (1889); *Die Meisterwerke des Mittelalters* (1893); *Scheffel's Ekkehard* (1893); *Scheffel's Trompeter von Sakkingen* (1895); *Dahn's Ein Kampf um Rom* (1900); and *Schiller's Maria Stuart* (with Margarethe Muller, 1900).

Wernle, Henry, inventor, born in Germany about 1831; died in Philadelphia, Pa., May 20, 1902. He was educated in Germany; came to the United States in 1852; and entered the Government service at the Frankford arsenal as an inventor and maker of delicate mathematical instruments. During the civil war his services were of great value on account of the many inventions of gun-sights that he perfected. The manner of tempering his instruments was a secret that Mr. Wernle carefully guarded. Although often urged to impart the information to others, he never did so, and the secret died with him.

West, William H., actor and minstrel performer, born in Syracuse, N. Y., June 18, 1853;

died in Chicago, Feb. 15, 1902. He made his first appearance when a boy as a singer and dancer in a Buffalo concert-hall. His cleverness attracted attention, and he was soon engaged to travel with P. T. Barnum's circus, and after that with Skiff and Gaylord's Minstrels. In 1869 he formed a partnership with George H. Primrose, another well-known minstrel performer, whom he had known as a boy, and this business contract lasted thirty years. Together they appeared in Simmons and Slocum's Minstrels in Philadelphia, and in 1873 the partners went to New York, and first appeared there at the old Olympic Theater, Broadway, near Houston Street. In the season of 1874-'75 they became members of J. H. Haverly's Minstrels, and traveled with that company three seasons. At the end of this engagement they organized a minstrel company of their own, calling it Barlow, Wilson, Primrose, and West's Minstrels. In 1882 the personnel of the management changed, and the company took the name of Thatcher, Primrose, and West, appearing under that title for seven years, after which Mr. Thatcher left the company, which was thereafter managed by the two original partners under the name of Primrose and West's Minstrels. The organization was for a long time the finest and most popular in the business, and drew immense audiences all over the country. In 1898 the long partnership was dissolved. Mr. West desired to have his company appear without blackened faces, and to add many accessories and stage settings before unknown in minstrel performances; while Mr. Primrose clung to "black-face" minstrelsy, with all its old traditions. They parted amicably, and Mr. West organized another company, calling it West's Big Minstrel Jubilee, and to it devoted the later years of his life, with great success. He usually appeared on the stage as "middleman" or interlocutor, but occasionally acted as "end-man." His voice was remarkably sweet, and he was tall, well-built, and a graceful dancer. He accumulated a handsome fortune and owned a fine property at Bensonhurst, Long Island. Mr. West was married three times, his first wife being Fay Templeton, the popular actress, from whom he was divorced; his second wife was Lizette Morris, who died soon after their marriage; and his third was Emma Hanley, also an actress.

Whipple, William Denison, military officer, born in Nelson, N. Y., Aug. 2, 1826; died in New York, April 1, 1902. He was graduated at West Point and commissioned brevet 2d lieutenant in the 3d Infantry, July, 1851; was promoted 1st lieutenant, Dec. 31, 1856; captain and assistant adjutant-general, Aug. 3, 1861; major, July 17, 1862; lieutenant-colonel, March 3, 1875; and colonel, Feb. 28, 1887; and was retired Aug. 2, 1890. In 1851 he was assigned to duty on the Indian frontier, and took part in the Navajo and Gila expeditions, and also in the defense of Fort Defiance, New Mexico. On Feb. 10, 1862, he was commissioned a lieutenant-colonel in the volunteer service; on Sept. 6, 1864, was promoted brigadier-general; and on Jan. 15, 1866, was honorably mustered out of that service. He took part in the battles of Bull Run, Chattanooga, Missionary Ridge, Resaca, Kenesaw Mountain, and Nashville and the siege of Atlanta; and was brevetted brigadier-general and major-general, U. S. A., for gallant and meritorious services during the war. After the war he was on duty as assistant adjutant-general at the headquarters of the principal military divisions, and in 1873-'81 as aide-de-camp on the staff of the general commanding the army.

Whitehead, William Biddick, physician, born in Virginia about 1832; died in Denver, Col., Oct. 13, 1902. He was graduated at the Virginia Military Institute in 1851, and studied medicine at the Universities of Virginia and Pennsylvania, and subsequently in Paris and Vienna. While in Vienna he was appointed a surgeon in the Russian army, was ordered to the Crimea, and was stationed at Sebastopol during the siege of that city. For his services he was made a knight of the Imperial Order of St. Stanislaus. He resigned his post of staff surgeon in the Russian army after five months' service; returned to Paris to resume study in the hospitals; and settled in New York, where he became Professor of Clinical Medicine in New York Medical College. In 1861 he entered the Confederate army, and was commissioned chief division surgeon. After the war he returned to New York city to practise, and later removed to Denver, Col. He established the department of medicine in the Universities of Colorado and Denver.

Whittle, Francis McNeece, clergyman, born in Mecklenburg County, Virginia, July 7, 1823; died in Richmond, Va., June 18, 1902. He was graduated at the Theological Seminary at Alexandria in 1847, and in 1848 was ordained priest. He was rector of Kanawha Parish in what is now West Virginia in 1847-'49; of St. James's Northam Parish, Goochland County, Virginia, in 1849-'52; of Grace Church, Berryville, Va., in 1852-'57; and of St. Paul's, Louisville, Ky., in 1857-'68. In 1868 he was consecrated Assistant Bishop of Virginia, and he became bishop of the diocese in 1876, on the death of Bishop Johns. When the diocese of Western Virginia was set off from Virginia in 1877, Bishop Whittle chose to remain in charge of the eastern diocese, which in 1892 was still further reduced by the organization of the diocese of Southern Virginia. At his death, however, the diocese, even with the loss of two-thirds of its former territory, was far stronger than at the time of his consecration. Bishop Whittle received the degree of D. D. from the Theological Seminary of Ohio in 1867, and LL. D. from William and Mary College in 1878. In his theology the bishop was strongly evangelical.

Williamson, James A., lawyer, born in Adair County, Kentucky, Feb. 8, 1829; died in Jamestown, R. I., Sept. 7, 1902. He was educated at Knox College, Illinois, studied law, and was admitted to the bar. In 1861 he enlisted in the 4th Iowa Infantry as 1st lieutenant and adjutant; was promoted lieutenant-colonel, March 9, 1862; colonel, March 18, 1862; and brigadier-general, Jan. 13, 1865; and was brevetted major-general of volunteers, March 13, 1865. He participated in the battles of Pea Ridge and Chickasaw Bayou, the siege of Vicksburg, and the capture of Savannah. After the capture of Savannah he received command of the military district of Missouri, where he remained till the surrender of Gen. Lee's army. After the war he resumed law practise; was commissioner of the United States General Land Office from 1876 till 1881; and afterward land commissioner and general solicitor of the Atlantic and Pacific Railroad Company and its president.

Wilson, Joseph Miller, engineer, born in Phoenixville, Pa., June 20, 1838; died in Philadelphia, Pa., Nov. 24, 1902. He was graduated at Rensselaer Polytechnic Institute in 1858, was appointed an assistant engineer of the Pennsylvania Railroad in 1860, and was connected with that road till 1886, during which time he served as resident engineer and as engineer of bridges and buildings. In 1876 he was associate engineer

and architect on the designing and construction of the Main Exposition Building and Machinery Hall for the Centennial Exposition. He served on the commission that condemned the Washington Aqueduct, and on the one that recommended the underground-railroad system now under construction in New York city. He was president of Franklin Institute several years and author of many technical and scientific papers and reports.

Wilton, Ellie (Mrs. Thomas C. Doremus), actress, born in Albany, N. Y., in 1852; died in Whitestone, Long Island, July 20, 1902. Her father, John Leonard, moved to San Francisco while she was very young, and when she was only fourteen years old she joined a traveling theatrical company, where her talent and personal beauty soon won her advancement to important rôles. She made an extended tour through the West, playing principal parts in mining-camp theaters long before she was twenty years old, and after a few seasons of that hard experience she was engaged as leading lady in the California Theater, San Francisco, where she remained seven years, winning great popularity and appearing in support of most of the celebrated actors of that time who visited the West. At the end of this long engagement she went to Europe to study, remaining there two years; on her return to the United States she was engaged by Manager A. M. Palmer for his Union Square Theater Company, and she made her first New York appearance in that theater in the comedy called French Flats. She was a member of this company several seasons, and left it to play leading support to the Italian tragedian Tommaso Salvini, with whom she traveled two seasons. She appeared in Charley's Aunt during its long run at the Standard Theater, New York city, and after that she joined the Frohman forces and played in one or another of their companies till 1900, when she originated the rôle of Queen Margaret in A Royal Family, with Annie Russell as the star, at the Lyceum Theater. During that season she injured her foot and was compelled to leave the company. She never again appeared on the stage, but lived at her Long Island home until her death.

Winner, Septimus, composer and publisher of music, born in Philadelphia, May 11, 1827; died there, Nov. 23, 1902. He composed the famous song Listen to the Mocking-Bird, which was a great favorite for many years, and also What is Home without a Mother? which was almost equally popular. He wrote a song entitled Give us back our Old Commander, which made a great sensation when it appeared, and very nearly involved the author in trouble with the Government, as it referred directly to the removal of Gen. George B. McClellan from his command of the Army of the Potomac in 1862. The War Department issued an order forbidding actors or any other persons to sing it in public, on pain of imprisonment; and Mr. Winner, who asserted his innocence of intending anything treasonable in writing the song, was notified that his further publication of it would result in his confinement in Fort Lafayette. Besides his songs, he wrote and published numerous books of technical instruction for various musical instruments. In his earlier years he was a frequent contributor of verse to the American literary magazines, and he was also the founder of the Musical Fund Society of Philadelphia. His last work was The Cogitations of a Crank.

Yeoman, George F., jurist, born in Andes, N. Y., Oct. 29, 1846; died in Rochester, N. Y.,

June 1, 1902. He removed in 1871 to Rochester, where he studied law and was admitted to the bar in 1875. He then became associated with Eugene H. Satterlee. This firm continued in practise till November, 1893, when Mr. Yeoman was appointed an associate justice of the Supreme Court of New York, which post he held till Jan. 1, 1895. He then resumed practise with his former associate and Joseph W. Taylor, and that relation continued till Mr. Yeoman's death. He was for many years a member of the Board of Managers of the State Industrial School and a trustee of the Rochester Orphan Asylum.

Young, Eliza Bland, actress, born in London, England, May 31, 1812; died in the Actors' Home, West New Brighton, Staten Island, N. Y., Aug. 10, 1902, being then the oldest actress in the United States. She made her first appearance in 1822, at the Adelphi Theater, London, in a play called *Scotch Valley*. After a brief experience on the stage she returned to school for five years, and then reentered theatrical life. She traveled through England and other countries, playing soubrette and juvenile rôles for several seasons, supporting at various times Gustavus Brooke, Mr. and Mrs. Charles Kean, Ira Aldridge, and other stars. She was a member of the Robertson stock company for five years. In 1844 she married William Watkins Young, an English actor-manager, and in 1856 she came to the United States. She made her first appearance in this country June 4, 1857, at Providence, R. I., as Mrs. Lilywhite in a comedy entitled *The Forties and Fifties*. During the thirty years following she appeared in many stock companies of this country, and at one time or another supported nearly every prominent theatrical star of the American stage. She was the original Tabitha Stork in Lester Wallack's *Rosedale*, and acted in the first American productions of *The Ticket-of-Leave Man*, *The Serious Family*, *East Lynne*, and the *New Magdalen*. Her last appearance was in the season of 1899, at the age of eighty-seven, when she appeared as the Third Witch in *Macbeth* at the Fifth Avenue Theater, New York city, supporting Mrs. Langtry.

Zimmermann, Adolph, actor, born in Germany in 1870; died in New York, Feb. 22, 1902. He received his early dramatic training in the court theaters of his native country, and became a favorite in leading rôles. In 1900 he came to the United States, and entered the Irving Place Theater company as its leading man. He soon won the same popularity with German-American audiences that he had enjoyed in his own country. He was a highly accomplished and versatile actor, and aside from his professional work, he became very well known in some of the best German clubs and societies in New York.

OBITUARIES, FOREIGN. Abel, Sir Frederick Augustus, English chemist, born in 1827; died in London, Sept. 26, 1902. The family, of Swedish origin, had produced men notable in science, music, and painting. He entered the Royal College of Chemistry as one of Hofmann's first pupils, and was soon promoted to be an assistant. In 1851 he became Professor of Chemistry at the Royal Military Academy, Woolwich. In 1854 he was appointed chemist to the War Office, which post he held until 1888, when he was retired by the civil-service regulations. In these thirty-four years he made his most important contributions to the chemistry of explosives. His work on the use of guncotton as an explosive, which was summarized in a paper printed in the *Philosophical Transactions* of 1866 and in the *Bakerian Lecture* printed in the same

journal for the succeeding year, was perhaps his most important contribution to science. He showed how guncotton, previously regarded as dangerous and inefficient, could be safely handled and prepared of constant composition, and indicated its great value as an explosive agent. He also did important work, in conjunction with Sir Andrew Noble, on the chemical changes that result from firing gunpowder. In 1888 he was appointed chairman of the Government Committee on Explosives. As the result of a series of experiments conducted under its auspices, "cordite," an explosive containing both guncotton and nitro-glycerin, was patented by Abel and Dewar, and soon became the standard explosive of the country. In connection with the petroleum acts of 1868 and 1879 he devised an apparatus for determining the temperature at which petroleum gives off inflammable vapor which is still in general use. He took a leading part in establishing the Imperial Institute. He was elected a fellow of the Royal Society in 1860, and received a royal medal in 1887 for his researches on explosives. He was knighted in 1883, and the K. C. B. was conferred on him in 1891. He was president of the British Association for the Advancement of Science in 1890, and of the Iron and Steel Institute in 1891.

Acton, John Emerich Edward Dalberg-Acton, Baron, English historian, born in Naples, Italy, Jan. 1, 1834; died at Tegernsee, Bavaria, June 19, 1902. He was the son of Sir Richard Acton, inherited his large English property, and remained with his mother until he was sent when not yet ten years of age to the Catholic school at Oscott, of which Dr. Wiseman was the president. After completing the course of four years at Oscott, then a center of Catholic influence, visited often by the Oxford converts, he read with Dr. Logan, a priest in Edinburgh who had been a Protestant, and when prepared for admission to Cambridge, Dr. Logan's university, he applied successively at 3 colleges, and was each time refused because he was a Roman Catholic. Consequently he went to study at Munich, where he lived in the house of Dr. Doellinger, with whom he visited Rome in 1857, having in the previous year attended the coronation of the Emperor Alexander II with his stepfather, Lord Granville. He traveled in the United States and became acquainted with Prescott and Dr. Brownson, just as in Europe he came to know every eminent historian and every leader of Catholic thought. German, French, and Italian to him were household tongues as well as English, and from his youth up he impressed scholars and statesmen alike with the vast range of his knowledge and the brilliancy of his conversation. When Newman had displeased the authorities of his Church by enunciating some original views of doctrine and polity in the *Rambler* and had resigned the editorship in consequence, Sir John Acton succeeded him, and soon afterward transformed the periodical into the *Home and Foreign Review*, to which some of the foremost writers of Europe contributed until he stopped the publication because the authorities

of the Church frowned upon him on account of his opposition to ultramontanism. While the Council of the Vatican was sitting in 1870 he learned from leading bishops who took part and revealed in letters to the *Münch Allgemeine Zeitung* the phases and vicissitudes of the contest and the moves and combinations of parties. After the Vatican decree was issued he still maintained his opposition to ultramontanism and adduced historical reasons in the public press. From 1859 till 1865 he sat in Parliament for Carlisle. Although he made no mark as a speaker, he influenced Gladstone and helped to shape the policy that rent the Liberal party asunder. He was returned for Bridgnorth in 1865, but was unseated on a scrutiny. In that year he married a daughter of Count Arco Valley, by whom he had a son, Richard, now Lord Acton. In 1869 he was raised to the peerage as Baron Acton of Aldenham. He sold the castle of Herrnsham and crippled his English estate to gather together 60,000 volumes that are documents of the religious, political, economic, and popular history of Europe. Although he had notes and references by the boxful, covering every phase and movement of modern history, some rare articles in reviews were his only published writings. He could discourse in conversation lucidly, with profound conviction and astonishing accuracy of memory, on the whole political and social evolution of modern times, yet when he took the pen to write historical and literary allusions clogged his style and a striving for exactness of statement obscured it with strange phrases. Although he produced no work he was recognized as the most learned and scientific of British historians, and in 1895, having just previously held a place at court for three years, he was appointed Regius Professor of History at Cambridge, where he put into practise methods of investigation and study more thorough and conscientious than had before been introduced in England. Andrew Carnegie purchased Lord Acton's library some years before the latter's death and left it for his use in its fireproof building at Aldenham. After Lord Acton's death Mr. Carnegie gave it to John Morley to keep or to bestow where he saw fit, and Mr. Morley presented it to the University of Cambridge.

Adamson, Robert, Scottish philosopher, born in Edinburgh in 1852; died in Glasgow, Feb. 6, 1902. He won the highest honors at Edinburgh University, and after continuing his studies at Heidelberg he returned to become assistant professor, leaving the university again in 1876 to succeed Stanley Jevons as Professor of Logic and Philosophy in Owens College, Manchester, where he remained till in 1893 he was elected Professor of Logic at Aberdeen University, whence he went to Glasgow in 1895 to fill the chair of Logic and Rhetoric. He wrote a treatise on the Philosophy of Kant, and the article on him in the *Encyclopædia Britannica*, also articles on English philosophers and on logic and the mind, and had in preparation when he died a book on Kant and the Modern Naturalists, and one on the History of Psychology. He was an active promoter when at Manchester of the Victoria University and at Glasgow in obtaining the extension of the session and the fuller educational equipment of the university.

Albert, King of Saxony, born in Dresden, April 23, 1828; died in Sibyllenort, June 19, 1902. He was the son of Crown-Prince Johann and Princess Amalia of Bavaria. He entered the Saxon army as a lieutenant in 1843 and studied in the university of Bonn, which he left to join

his regiment when the revolution broke out in 1848. As captain of artillery he distinguished himself at the storming of the redoubts of Düppel in the Schleswig-Holstein campaign of 1849. After his father became King in 1854 he took a prominent part in civil and military affairs, and in the Austro-Prussian War of 1866 he was commander-in-chief of the Saxon army, which left Saxony undefended to concentrate in Bohemia with the Austrian force of Gen. Clam Gallas, whose unsuccessful stand at Gitschin enabled the Prussians to bring the campaign to a quick termination four days later at Königgratz, where Crown-Prince Albert with his Saxons stubbornly held the left of the Austrian position against Gen. Herwarth von Bittenfeld's Army of the Elbe until after Gen. Benedek's Austrian army was defeated and rendered helpless by the capture of the key of the position at Chlum by the Prussian Crown Prince. When Saxony was absorbed in the North German Federation Prince Albert remained in command of the Saxon troops, henceforth known as the Saxon corps and officially designated as the 12th North German Corps. He led them in the Franco-German War, and so distinguished himself by turning St. Privat and bringing up his troops through the Bois des Rognons to turn the tide at Gravelotte that he was placed in command of the army of the Meuse, composed of the united Prussian guard corps, with 2 cavalry divisions. While advancing from Metz upon Châlons, he was suddenly ordered to take part in the flanking movement by which the German columns hemmed Marshal MacMahon's army and encircled it with an iron ring at Sedan, where the Saxon Crown Prince's column, after defeating Gen. Douay's corps at Nouart and Gen. Faily's at Beaumont, formed the right wing. He was active in the bombardment of Mont Arron in the siege of Paris, and after the war was made a field-marshal and inspector-general. He succeeded to the throne on the death of his father, Oct. 29, 1873. He was the confidential friend of the three successive German Emperors and a loyal upholder of the empire in which Saxony was overshadowed and his own powers effaced by the importance of Prussia. He promoted music and art, like his forefathers, and welcomed Americans and English at court festivities. His Queen, whom he married in 1853, was Princess Carola, daughter of Prince Gustavus Vasa of the old Swedish dynasty. The marriage was without issue, and the succession fell to Prince Georg, his brother, born in 1832, whose son by Princess Maria Anna of Portugal, Prince Friedrich August, born May 25, 1865, the present Crown Prince, married, on Nov. 21, 1891, the Archduchess Louise Antoinette, born Sept. 2, 1870, Princess Imperial of Austria and daughter of the Archduke Leopold Ferdinand, son and heir of the former Grand Duke of Tuscany, by the Princess Alice of Bourbon and Parma. The Crown Princess in December, 1902, eloped and left her children, Prince Friedrich Christian, born Dec. 31, 1893, Prince Ernst Heinrich, and three daughters, the youngest born in September, 1901.

Ali, Bey of Tunis, born Oct. 5, 1817; died June 11, 1902. Sidi Ali succeeded his brother, Sidi Mohammed es Sadok, Oct. 28, 1882, the year after the latter's recognition of a French protectorate in the treaty of Kasr es Said, signed May 12, 1881. The reigning family of Tunis was established by Ben Ali Turki, a native of Crete, who seized the throne in 1691. Sidi Ahsin, the father of Sidi Mohammed and Sidi Ali, obtained a firman from the Sultan of Turkey liberating him from the payment of tribute, but not re-

nouncing the suzerainty of Turkey over Tunis, which had been in existence since 1575, though not effectively exercised in recent times. When the French invaded Tunis Ali Bey, who was then commander-in-chief of his brother's troops, offered no serious resistance, and was one of the first to accept the protectorate, using all his influence to obtain the willing submission of the tribes and employing his troops to force the rebellious to submission. Coming to the throne at the beginning of the French *régime*, he loyally yielded up all political and financial control and used his great influence and royal authority to prevent any check to the innovations of civilization and foreign government. The French on their part left the relations between Mussulmans entirely in his hands, so that he was still a Mohammedan monarch, dispensing justice and charity and governing the people in their social and religious life according to the laws of Islam. In his palace he fed over 700 persons. His physical and mental vigor declined in his later years. Sidi Mohammed, his son and successor, who was forty-six years of age when his father died, has often sojourned in Paris, and is the first Bey able to speak French.

Angus, Joseph, English clergyman, born in Bolan, Northumberland, England, Jan. 16, 1816; died in Hampstead, England, Aug. 28, 1902. He was educated at King's College and Stepney College, London, and at Edinburgh University, and studied for the Baptist ministry. At the age of twenty-four he became secretary of the Baptist Missionary Society, and in 1849 president of Stepney College for the education of non-conformist ministers, and in 1866 of the College of Regent's Park, to which the Stepney institute was then removed. For more than forty years he continued in this office, and under his management the usefulness of the institution was greatly extended. He was a man of extremely broad sympathies, and his interests were manifested in many directions. He served on the London School Board ten years, and he was one of the revisers of the New Testament. His published works comprise *Essay on the Voluntary System* (1839); *Bible Handbook* (1854); *Bishop Butler's Analogy*, also *Fifteen Sermons, with Life, Analysis, and Notes*, usually considered the best edition of the *Analogy* (1855); *Christ our Life* (1855); *Handbook of the English Tongue* (1861); *Christian Churches and Christian History* (1862); *Handbook of English Literature* (1865); and *Handbook of Specimens of English Literature* (1866).

Arnold, Sir Arthur, English author, born in Framfield, Sussex, England, May 28, 1833; died in London, May 20, 1902. He was the son of Robert Coles Arnold, and a younger brother of Sir Edwin Arnold. He was educated privately, and was assistant commissioner of public works in Lancashire in 1863-'64. Later he became known as a traveler, and from 1880 to 1883 he represented Salford in the House of Commons. He was an ardent Liberal and took an active interest in politics, and was for some time president of the Free Land League. He was also chairman of the London County Council, 1895-'97. His writings include *History of the Cotton Famine* (1865); *From the Levant* (1868); *Through Persia by Caravan* (1876); *Free Land* (1880); and *Social Politics* (1881).

Arnold, George Benjamin, English organist and composer, born in Petworth, Sussex, England, Dec. 22, 1822; died in Winchester, Jan. 31, 1902. In 1849 he became assistant organist at Winchester Cathedral. He was subsequently organist at St. Columba's College, near Dublin,

Ireland; of St. Mary's Church, Torquay; and from 1860 to 1865 was organist of New College, Oxford. In the year last named he was appointed organist of Winchester Cathedral. He ranked among the first English players of his time, and he won distinction also as a composer. His oratorio *Ahab* was brought out in 1864, and his cantata *Sennacherib* was produced at the Gloucester Festival of 1883. In 1893 he composed the cantata *The Song of the Redeemed*, for St. James's Church, New York city; and for the King Alfred Milenary in 1901 he wrote an orchestral introduction and a chorus of praise. He also composed works for the piano and a large number of anthems, the best known of which is the familiar *The Lord is my Shepherd*.

Ashmead-Bartlett, Sir Ellis, English politician, born in Brooklyn, N. Y., in 1849; died in London, Jan. 19, 1902. His education was received at Torquay, Devonshire, and at Oxford. He was called to the bar of the Inner Temple in 1876, was examiner in the Education Department in 1874-'80, and sat in the House of Commons from 1880 till his death. He was a civil lord of the Admiralty in 1885-'92, and was knighted in the latter year. He was a favorite with the Sultan of Turkey, who bestowed upon him the "Grand Cordon of the Medijeh." In 1900 he served in the English army in South Africa. He was a brilliant orator, his chosen theme being the imperial strength and majesty of England, and he was accounted the most outspoken exponent of what is termed "jingo sentiment" in Parliament. His only published book was *The Battle-Fields of Thessaly* (1897).

Bailey, Philip James, English poet, born in Nottingham, England, April 22, 1816; died there Sept. 6, 1902. He was educated at Glasgow University, and after studying law at Lincoln's Inn was admitted to the bar in 1840, but did not practise. In his twentieth year he began to write *Festus*, a lyric drama on the Faust legend, which appeared in 1839 and speedily made its author famous, 11 editions of the work being published in England and 30 in the United States. The poem was extravagantly praised at the time of its appearance, but has long been neglected by the general reader, though still prized by a few. While by no means worthy of the laudations it first received, it does not deserve the neglect into which it has fallen, for it exhibits a wealth of noble and sustained imagery, and the blank verse, though wanting in the sonorous quality, and not especially sweet, is well suited to the subject and is often genuinely poetic. It was the theme rather than the form that gained the poet the attention he received, and certain lines from *Festus* are still quoted. None of his other works attracted much notice, and the poet's later life was passed in strict retirement. He was married twice, the first time very unhappily, and was a resident of Jersey from 1864 to 1876, but afterward lived in Nottingham. His income from his writings was but slender, and he not only applied several times for relief from the Royal Literary fund, but was for many years in receipt of a pension from the Civil List of £100. Be-

sides *Festus* (1839), he published *The Angel World, and Other Poems* (1850); *The Mystic, and Other Poems* (1855); *The Age, a Colloquial Satire* (1858); *The International Policy of the Great Powers* (1861); and *The Universal Hymn* (1868).

Barail, Gen. du, French soldier, born in 1820; died in Neuilly, Jan. 24, 1902. He took part as a lieutenant in the capture of Abdul Kader, served several years in Algeria and performed distinguished services as commandant of Laghouat, served in the Mexican campaign as colonel, commanded a division of cavalry in the war of 1870, and fought at Mars-la-Tour and St. Privat, and was taken to Germany a prisoner at the surrender of Metz. On returning to France after the peace he was placed in command of a division in the Versailles cavalry army corps, and took an active part in suppressing the Paris Commune. On May 29, 1873, when the Thiers Cabinet was overturned, Marshal MacMahon made him Minister of War, and when the Reactionary ministry was driven out he was assigned to the command of the engineer corps and retired shortly afterward.

Barlow, William Henry, English civil engineer, born May 10, 1812; died Nov. 14, 1902. He was a brother of the eminent engineer Peter William Barlow. He was educated for the engineering profession at the Royal Dockyard, Woolwich, England, and at the age of twenty was sent to Constantinople to superintend the erection of buildings and machinery for the Turkish Government. He was resident engineer to the Midland Railway in 1842-'57, and as consulting engineer of that system designed the St. Pancras terminal station in London, with a roof of 240 feet span. The new Tay Bridge was constructed by him, 1880-'87. He went to the United States in 1876 as one of the judges of the Centennial Commission, was a fellow of the Royal Society, was admitted a member of the Institute of Civil Engineers in 1845, and was its president in 1880. He published *Illumination of Lighthouses* (1837); *Diurnal Electric Tides and Storms* (1848); *Resistance of Flexure in Beams* (1865); and *The Logograph* (1874).

Baxter, Mrs. Lucy E. (Barnes), English author, born in Mere, Wiltshire, England, about 1835; died in Florence, Italy, Nov. 10, 1902. She was a daughter of the Rev. William Barnes, the Dorsetshire poet, and was educated at home. She began at eighteen to contribute stories to ladies' annuals, and throughout her life she clung to the pen name her father had suggested, of "Leader Scott." In 1867 she married S. T. Baxter, and thenceforward resided in Italy. She was popular in Italian literary and artistic circles, and was an honorary member of the Accademia delle Belle Arti. Her published books include *The Painter's Ordeal*; *A Nook in the Apennines* (1879); *Fra Bartolommeo and Andrea del Sarto, in the Great Artists Series* (1889); *Fra Angelico, in the same series* (1881); *The Renaissance of Art in Italy* (1882); *Messer Agnolo's Household: A Cinque Cento Florentine Story* (1882); *Ghiberti and Donatello, with Other Early Italian Sculptors* (1882); *Luca della Robbia, in Great Artists Series* (1883); *A Bunch of Berries and the Diversions Thereof* (1883); *Sculpture: Renaissance and Modern* (1886); *Tuscan Studies and Sketches* (1887); *The Life of William Barnes, Poet and Philologist* (1887); *Vincigliata and Mariano* (1891); *The Orti Oricellari* (1893); *Echoes of Old Florence* (1894); *The Castle of Vincigliata* (1897); *The Cathedral Builders* (1899); and *Filippo di Ser Brunellesco* (1901). The *Cathedral Builders*, her most important work, is a scholarly and ingenious attempt to refer the medieval

architecture of Europe to the labors of a great masonic guild, the *Magistri Comacini*, but her theory has not met with much support from competent authorities.

Beckles, Edward Hyndman, English colonial prelate, born in Barbados in 1816; died Dec. 5, 1902. He was the son of the president of the island, and after obtaining an education at Codrington College, Barbados, he was admitted to the priesthood of the Anglican Church in 1844. A short curacy at Holy Trinity Church, Port of Spain, Trinidad, 1843-'44, was succeeded by the incumbency of several years of St. Michael's parish, Diego Martin, in the same island, and for six years of this period he was chaplain to the English forces there. He then passed a short time in England, holding brief curacies in London, but in 1853 became rector of St. Peter's, in the island of St. Kitts. In 1860 he was made Bishop of Sierra Leone, but he resigned his see in 1869, and, going to England, was successively minister of Berkely Chapel, London, 1869-'70; rector of Wootton, Kent, 1870-'73, and vicar of St. Peter's, Bethnal Green, London, 1873-1902. He had been incapacitated for active parish duty for several years preceding his death. In 1877-'82 he was supervising bishop of the Episcopal churches in Scotland.

Belcredi, Count Richard, Austrian statesman, born in 1823; died in Gmünden, Dec. 3, 1902. His family had been prominent in Austrian politics for several generations, and he had a brilliant administrative career, becoming Statthalter of Bohemia in 1864. In the following year he was made Prime Minister of Austria. He was the leader of the Feudal Conservative element, which promoted the federal system in Austria, and was placed at the head of the Government appointed to carry out this plan, but the defeat of the Austrian army brought the centralistic German party once more into power. His ministry was signalized by the suspension of the Constitution. The disastrous war with Prussia had for its result the return to a constitutional régime and the compromise with Hungary. Belcredi retired in 1867. In 1881 he was recalled from obscurity to the post of president of the Court of Administrative Justice and made a member of the House of Lords.

Bennett, Alfred William, English botanist, born in London, England, in 1833; died Jan. 23, 1902. He received his education at University College, London, and for many years was a lecturer on botany at St. Thomas's Hospital, London. He published (with G. Murray) a *Handbook of Cryptogamic Botany* (1889) and a valuable *Flora of the Alps* (1896).

Bennigsen, Rudolf von, German politician, born in Lüneburg, July 10, 1822; died Aug. 8, 1902. He studied law and entered the Hanoverian civil service in 1846, resigning his office in 1857 to take a seat in the lower chamber of the Diet, where he joined with Dr. von Miquel in founding the German National Union with the object of realizing the federation of the German states under the headship of Prussia with a strong constitutional Central Government. He endeavored to avert the annexation of Hanover to Prussia in 1866 by a declaration of neutrality, and after the incorporation was accomplished he strove all the harder to bring about German unity with popular parliamentary institutions, and the National Liberal party of which he was the leader extended its activity and organization to all parts of Germany. When the North German Federation was constituted in 1867 he was elected to the North German Reichstag and to the Prus-

sian House of Deputies, of which he was president from 1873 till 1879. The National Liberals supported Prince Bismarck's policy in all matters tending to strengthen and consolidate the empire, while defending the parliamentary system for Prussia as well as for the German Empire. In December, 1877, Bismarck invited Bennigsen to take a portfolio in the Prussian ministry, but he would not unless other Liberals were included and the policy of the Government modified. In 1886 he was appointed president of the province of Hanover. This office he resigned in 1897, and a year later he retired from the Reichstag, in which he had been a conspicuous and honored leader from the beginning.

Bentley, John Francis, English architect, born in Doncaster, England, in 1839; died in Clapham Common, March 2, 1902. At the age of fifteen he made a beautiful model of the old parish church of his native town. This church was soon afterward destroyed by fire, and on the occasion of its rebuilding young Bentley was placed in the office of the clerk of the works, his architectural education, in effect, beginning at this time. He began architectural practise on his own account in 1862, and the greater part of his work thereafter was executed for Roman Catholic patrons. His most notable design is the Roman Catholic cathedral at Westminster, on the site of the former Milbank Prison, an edifice of colossal proportions, its nave being the widest of any in England. It is a strikingly original conception, the treatment, according to the requirements of his commission, being Byzantine. Its exterior was left practically complete at the architect's death, save for the carving intended and the contemplated octagonal lantern of the lofty tower. The interior was very incomplete. Other works by this architect include the church and convent of the Immaculate Conception, at Bocking, Essex, in early middle pointed style, opened in 1899; the churches of the Holy Rood, at Watford; Corpus Christi, Brixton; and St. Mary, Kensal Green; Beaumont College, near Windsor; and the great Roman Catholic cathedral in Brooklyn, Long Island, N. Y. He also decorated the London Church of St. Botolph, Aldgate, and restored that of St. Botolph, Bishopsgate within. The Royal Institute of British Architects had decided to give him the royal gold medal, but his death occurred before it was received. Bentley was most emphatically an all-round architect; in all his commissions he designed and directed everything from foundation to smallest detail of decoration.

Bloch, Jean de, Russian reformer, born in Warsaw in 1832; died there, Jan. 7, 1902. He was a Polish Jew who became one of the largest builders of railroads in Russia, and a prosperous banker. In his leisure time he studied the modern works on political economy and evolved theories of his own in support of which he gathered a mass of historical and statistical evidence. The economic waste and the demoralization and deterioration of society caused by war attracted his attention, and then the scarcely less injurious effect of modern armaments in hindering progress and crippling the productive energy of European peoples, and he concluded that the armies and navies which were prepared for great wars, and which the great powers were still increasing, had already reached such a magnitude and the death-dealing weapons such a development that no Government would venture to break the armed peace for fear that destruction might befall its army, involving the fate of the whole nation, and that if a great war did result it

would wipe out the fruits of centuries of civilization. Hence he pleaded for the arrest and reduction of the costly armaments which hem back progress in the peaceful arts and general well-being, and argued in favor of total disarmament and the abolition of the system of the nation in arms. His theories and the evidence on which they are based were published in six large volumes entitled *La Guerre*. The Emperor was impressed with this work, in the preparation of which M. de Bloch spent eight industrious years, and he called the author into consultation before he made the proposals, prefaced by a suggestion of the limitation of armaments, which resulted in the Peace Conference in the summer of 1899. M. de Bloch was present at The Hague, and, although he was not a delegate, he had no little influence in bringing the conference to a successful issue by stimulating and encouraging with his enthusiasm the members who were in favor of arbitration. His work in abridged compass was published in English in 1900 under the title of *Modern Weapons and Modern War*.

Bonehill, Bessie (Mrs. William Seeley), English actress and singer, born in England in 1857; died in Portsea, Aug. 21, 1902. Her first appearance was in her own country when she was a child, and she was a favorite there for many years. In 1891 she came to the United States, appearing in vaudeville performances in New York city under the management of Tony Pastor. Her success was immediate, and she soon became as popular here as in England. After her engagement with Mr. Pastor she went back to London for two seasons, returning to the United States in 1893, under the management of J. J. Rosenthal, in a piece called *Playmates*. After this she appeared for several seasons throughout the States in musical comedy, burlesque, and vaudeville. She made a specialty of singing songs that told a romantic or pathetic story, and she nearly always sang them in picturesque male costume, illustrating the story in a dramatic and effective way. Her voice was a wonderfully rich and powerful mezzo soprano, and her face and figure were strikingly handsome. She was a brilliant impromptu speaker, and as an actress she had a charm that was as peculiar and original as it was potent. Her last appearance in this country was at Hyde and Behman's Theater, Brooklyn, N. Y., Nov. 26, 1900. After this engagement she purchased a country place, Deer Hill Farm, at Sayville, N. Y., intending to live there permanently, but she died while on a visit to her native land.

Booth, Sallie, English actress, born in London in 1839; died in Sydney, Australia, in March, 1902. Miss Booth was a lineal descendant of Barton Booth, the famous tragedian of Addison's day. She made her first appearance in 1843 at the benefit of her aunt (also Sallie Booth), at Drury Lane Theater, London. She appeared as *Rosalind* in *As You Like It* at the Haymarket Theater before she was twenty, and received high praise from Douglas Jerrold and other celebrated critics. At various periods she played as the support of Charles Kean, Charles Mathews, and other distinguished actors. In 1891 Miss Booth left Great Britain for the first time, to play in Jamaica, and finding traveling to her taste, she afterward made many tours to all parts of the world where English is spoken. In 1893 she played in Calcutta and Hong-Kong, and in numerous other Eastern cities. She traveled in the Orient four years, going as far inland as the Khyber pass. In 1898 she went to South Africa with George Edwardes's *The Little Minister* company, and later she made a second South African trip, playing in *What Happened*.

to Jones, in which play she also appeared in New York in 1900. Later in that year she went with Charles Arnold's company to Australia, where she was playing at the time of her death from the bubonic plague, which swept that country.

Botha, Christian, Boer soldier, born in the Transvaal; died in Kokstad, Griqualand West, Oct. 8, 1902. He led a commando into Natal at the beginning of the Transvaal war, and bore a prominent part in the investment of Ladysmith and the defense of the Tugela crossing. When the line was forced at last and Ladysmith relieved, he helped to hold the Biggarsburg, and retreated afterward with the rest of the Transvaalers to Laing's Nek, where his brother Louis Botha, the commandant-general, left him in command of the Boer forces on the Natal border on departing to defend the approaches of Pretoria against Lord Roberts. Chris Botha delayed Gen. Buller's advance several days by opening negotiations with him. After the fall of Pretoria he was assigned to the command of all the Boer forces in the southeastern part of the Transvaal, and by his raids into Zululand he created a diversion that enabled his brother and De Wet to prolong the conflict.

Bousfield, Henry Brougham, English prelate, born in 1832; died in South Africa, Feb. 10, 1902. He studied at Cambridge, and after taking orders in the Church of England in 1855 was curate of All Saints' Parish, Braishfield, Hampshire, 1855-'61; rector of St. Maurice's, Winchester, 1861-'70; and vicar of Andover, Hampshire, 1870-'78. In February of the last-named year he was consecrated Bishop of Pretoria, South Africa. During all the troublous years of his episcopate Bishop Bousfield kept aloof from politics, and after the outbreak of the South African War in 1899 he rendered many timely services to the English refugees. He published *Six Years in the Transvaal* (1886).

Brames, John, English philologist, died in Clevedon, Somerset, England, May 25, 1902, at the age of sixty-five. He was educated for the Indian colonial service at Haileybury College, and after being employed many years in the Punjab and Bengal, was appointed magistrate in the latter in 1867. In 1881 he became commissioner of the Bardwan division, and subsequently he had charge of the Bhagalpur and presidency divisions. He was president of the Police Revision Committee in 1890, and in 1893 he retired from the colonial service and returned to England. He was the author of *Outlines of Indian Philology* (1867); *Comparative Grammar of the Modern Aryan Languages of India* (1872-'79); and *Grammar of the Bengali Language* (1891).

Brandt, Kaethe, German actress, born in Berlin in 1878; died in New York, Jan. 12, 1902. She was connected with the stage from childhood, as her father was for many years stage director of the Hof Theater, Berlin. In the season of 1900-'01 she was a member of the stock company at the Hof Theater, Wiesbaden, where she achieved such success in emotional rôles that she was engaged to come to the United States for the season of 1901-'02. She made her American *début* at Irving Place Theater, New York (devoted to the German drama), Oct. 1, 1901, in *The Veiled Image of Saïs*, and immediately became a popular favorite. During the season she appeared in *Magda*, *The Night of St. Bartholomew*, *Dolly*, and *The Clemenceau Case*. She appeared for the last time in *The Marriage Market*, on the evening of Dec. 31, 1901, when she was suddenly taken ill. Miss Brandt was a grandniece of Richard Wagner, and at the time of her death

was betrothed to Albert Reiss, a German tenor of the Maurice Grau Grand Opera Company.

Brown, George Douglas, English novelist, born in Ochiltree, Ayrshire, Scotland, in 1869; died in London, Aug. 28, 1902. He was educated at the Universities of Glasgow and Oxford, and was first employed as a reporter for a London paper, and subsequently secured a place as literary adviser to a publishing house. His novel of *Scottish Life*, *The House with the Green Shutters*, published in 1902, attracted attention both in England and the United States, and displayed much ability.

Burton, Edmond Francis, English soldier, born in 1820; died near Cheltenham, England, May 23, 1902. He entered the East Indian army as ensign in the Madras native infantry, becoming lieutenant in 1842, captain in 1848, and major in 1861. He subsequently commanded in succession the Northern District of the Madras army, the Malabar and Canara Brigade (1878), the ceded districts (1880), and the British Banim Division (1882). In 1865 he was promoted to lieutenant-colonel, becoming colonel in 1870, and major-general in 1881. He retired in 1882, and after being placed on the unemployed supernumerary list, was appointed lieutenant-general in 1887 and general in 1891. Gen. Burton was the author of *Reminiscences of Sport in India* (1885); *An Indian Olio* (1888); and *Trouting in Norway* (1891).

Butler, Samuel, English author and composer, born in Langar, England, Dec. 4, 1835; died in London, June 19, 1902. His education was obtained at Shrewsbury School and at Cambridge. With Henry Festing Jones, Butler composed the cantata of *Narcissus* and many gavottes, fugues, and pianoforte numbers; but to the world in general he is better known as a brilliant and original writer in several fields. His published books include *A First Year in Canterbury Settlement* (1863); *Erewhon, or Over the Range* (1872); *The Fair Haven*, a purported defense of Christianity (1873); *Life and Habit* (1877); *Evolution, Old and New* (1879); *Unconscious Memory* (1880); *Alps and Sanctuaries of Piedmont and the Canton Ticino* (1881); *Luck, or Cunning as the Main Means of Organic Modification?* (1886); *Ex Voto: An Account of the Sacro Monto or New Jerusalem at Varello-Sesia* (1888); *Life of Dr. Samuel Butler, of Shrewsbury, and Bishop of Lichfield* (1896); *The Authoress of the Odyssey* (1897); *The Iliad of Homer*, rendered into English Prose (1898); *Shakespeare's Sonnets Reconsidered* (1899); *The Odyssey of Homer*, rendered into English Prose (1900), and *Erewhon Revisited* (1901). Butler was an artist of some merit, and exhibited for several years at the Royal Academy. One of his most noted pictures was entitled *Mr. Heatherley's Holiday*, representing the manager of an art school employing a holiday in repairing the school skeleton. As a master of irony Butler had few superiors, and his *Erewhon* approaches *Gulliver* in this respect more nearly than any other writing since *Swift*. *Erewhon Revisited*, in effect a vigorous attack upon revealed religion, has more coherence in the story than its predecessor, and the satire is much graver. *Fair Haven* is a masterly satire upon religious narrowness, but is accepted by many as an earnest defense of bigotry. Regarding Homeric authorship he held several amazing theories, apparently having intended a hoax in the first place, and ending by becoming converted to his own argument. He was naturally combative, and from the circumstance of his grandfather having had a wordy controversy with Darwin's grandfather, and his father having similarly engaged with the father of Dar-

win, he seems to have thought it incumbent upon him to perpetuate a kind of hereditary feud. His anti-Darwinian books, such as *Evolution*, *Unconscious Memory*, etc., were esteemed by him above his more brilliant works. They are thought-provoking, but hardly convincing.

Cairnes, William Elliot, English author and army officer, died in London, April 19, 1902. He received his lieutenant's commission in 1884, and was promoted to a captaincy in 1890. He was the author of the *Absent-Minded War*; *The Army from Within*; *The Coming Waterloo*; and *Lord Roberts as a Soldier in Peace and War*.

Callan, Philip, Irish politician, born in County Louth in 1837, died in Dublin, June 13, 1902. He was called to the Irish bar in 1865, and was elected to Parliament for the borough of Dundalk in 1868, when Isaac Butt was the Irish leader. Mr. Callan pleaded for the amnesty of Fenian prisoners. Charles Russell contested Dundalk unsuccessfully in 1870, successfully in 1874, whereupon Callan sought and won election as county member. When Charles Stewart Parnell began a policy of obstruction Mr. Callan hesitated only a short time before casting his lot with the new leader. His parliamentary experience and ready knowledge of the forms and his tireless flow of oratory made him the most formidable of the obstructionists. In 1885, when the franchise had been extended, the soundness of his political principles was called in question, and he was rejected by the Nationalist Convention. Nevertheless he determined to stand in opposition to Philip Nolan, whom Mr. Parnell came to support with his authority and eloquence. After the most tumultuous election that had taken place in Ireland, although Parnell was stoned, Callan was badly defeated. He contested North Louth again in 1892, supported by the Parnellite rump, against Timothy Healy, McCarthyite candidate, and was beaten again. In 1896 once more he strove in vain to reenter Parliament.

Casati, Gaetano, Italian explorer, born in Lombardy, in 1838; died at Como, March 7, 1902. He entered the Italian army as lieutenant in 1859, fought through the campaign of 1866, and retired with the rank of captain in 1879 to go to Africa to undertake commercial explorations. He traveled through the Bahr el Gazal into the Niam-niam and Monbuttu countries, returning in 1883 with Dr. Junker to be shut up with Emin Pasha at Lado, whom he helped efficiently to defend that place against the Mahdists until, in 1885, it became untenable, when Capt. Casati went south to Wadelai, where he hoped to open up friendly relations with Kabarega, King of Unyoro, and get letters through to the Europeans in Uganda. Kabarega showed a friendly disposition toward Emin and Casati, and the latter was in Unyoro in December, 1887, when Henry M. Stanley approached with a relief expedition. When the expedition inflicted severe losses on the Mazamboni warriors, subjects of Kabarega, who contested the passage through their country, the black King's feelings changed toward his guest, whom he held responsible for the invasion. Casati was cast into prison and condemned to death, but escaped and wandered about naked and starving until he was rescued by Emin. A few weeks later Stanley's expedition came to their relief. Casati returned to Italy and wrote a book describing his travels and adventures under the title *Dieci anni in Equatoria*.

Chamberlain, Sir Neville Bowles, English soldier, born in 1820; died near Southampton, Feb. 17, 1902. He was a son of Sir Henry Orlando Chamberlain, who sent him to Woolwich, but he

left abruptly to enter the Bengal army at the age of seventeen, and was immediately despatched in command of a troop of irregular cavalry to the Afghan war, in which he was wounded six times and so distinguished himself by his enterprise and valor that he was attached to the Governor-General's body-guard. He gained new laurels by his personal prowess in the campaign against the Sikhs, and subsequently as commandant of the Punjab frontier force. He commanded a mobile column in the Punjab at the beginning of the Indian mutiny, was afterward made adjutant-general of the army before Delhi, and was severely wounded in the siege. Two years later his successful rapid operations against the Waziris won for him the honor of knighthood. In 1863 he conducted another vigorous frontier campaign against the Bunerwals, and in leading the native soldiery in person to a difficult and dangerous assault he was again severely wounded, but the vital position of the enemy was captured by his plan and he was promoted major-general. From 1876 till 1881 he commanded the Madras army. He was sent on a mission to Shere Ali, Ameer of Kabul, and war resulted because the expedition was stopped at Ali Masjid, though the envoy himself, an adherent of Lord Lawrence's policy of masterly inactivity, deprecated any interference in Afghanistan. In 1900 he was made a field-marshal.

Cheyne, John Powles, British naval officer, died in Halifax, Nova Scotia, Feb. 8, 1902. He entered the navy in 1850, became a lieutenant in 1851, and retired with the rank of commander in 1870. He was an arctic explorer of experience, and took part in three expeditions in search of Sir John Franklin.

Chincholle, Charles Henri Hippolyte, French novelist, born at Chauny, France, July 16, 1845; died in Paris, Aug. 21, 1902. In his early years he was secretary to the elder Dumas, and occasionally collaborated with him. In 1872 he joined the staff of *Figaro*, and thenceforth remained in the service of that journal. He was a versatile, sympathetic, and ready writer, but his style was lacking in finish. He was the author of a one-act farce, *Oncle Margottin*, which ran 300 nights in 1870, and of *Le Mari de Jeanne* and other plays, while his published romances and other works include *La Plume au Vent* (1865); *Alexandre Dumas Aujourd'hui* (1867); *Les Pensées de tout le Monde* (1868); *Dans l'Ombre* (1871); *Le Lendemain de l'Amour* (1880); *Le Catalogue de l'Amour* (1881); *Paula, Histoire d'une Névrosée* (1882); *La Ceinture de les Survivants de la Commune* (1884); *Le Vieux Général* (1886); *Femmes et Pois* (1886); *La Grande Prêtresse* (1887), and *Biographe du General Boulanger* (1889).

Christich, Nicola, Servian statesman, died Jan. 25, 1902. He was the chief of the Progressist party and for long periods the most powerful political personage in Servia. He was Prime Minister before the abdication of King Milan in 1889. When the young King Alexander in 1894 suspended the Constitution, suppressed the regency, assumed the Government in person, and proclaimed an amended Constitution, Christich prompted the *coup d'état* and became Prime Minister, resigning in the following year.

Clarke, Sir Andrew, British military engineer and colonial statesman, born in Southsea, England, July 27, 1824; died in London, March 29, 1902. He was the son of Col. Andrew Clarke, who was the first Governor of Western Australia; studied at Woolwich; was commissioned second lieutenant of engineers in 1844; served a short time in

Ireland during the famine; was appointed to a position on his father's staff, but on the way to Perth was persuaded to remain in Van Diemen's Land as military secretary to the Governor, Sir William Denison; left there in 1847 for the Maori war in New Zealand, and served on the staff of Sir George Grey, Governor of that colony, till he was called to Victoria as Surveyor-General. He took a prominent part in framing the Constitution of Victoria, and when it went into force he was elected member for Melbourne in the Legislative Assembly and called into the first Cabinet as Minister of Public Lands in 1855. In 1857, when this ministry resigned, he declined to form a Cabinet and returned to England. In 1863 he was ordered to the west coast of Africa to plan operations against the Ashantis, but soon returned, and for nine years, as director of works for the navy, he was engaged in planning the reconstruction of the naval arsenals at Chatham; Portsmouth, and Plymouth, the fortifications at Malta and Cork, and the naval fortress and floating dock at Bermuda. In 1873 he was appointed Governor of the Straits Settlements, where he concluded in the following year with the Malay chiefs of Perak the treaty of Pangkor, by which they accepted British residents to rescue the country from the impoverishment and disorder that prevailed in consequence of fights among themselves and among the Chinese miners, who were induced to disarm. He next went to Siam and composed the quarrel between Chulalongkorn and the second King, who was persuaded to abandon his claim to rule. In 1875 he went to India as Minister of Public Works, and there, among other improvements, he secured a supply of fresh water for the soldiers that greatly reduced mortality from typhoid and lowered railroad rates so as to enable the Punjab to export wheat. He returned to England in 1881, and as no suitable colonial post was vacant he asked to be assigned to duty, though in the engineer corps he was only a lieutenant-colonel still. He organized a bridge-building company of trained mechanics. He was appointed inspector-general of fortifications in 1882, and completed the plans for imperial naval defense that he had begun nine years earlier, including the fortification of Colombo and Singapore. Retiring from the army as lieutenant-general in 1890, Sir Andrew Clarke, who had received the colonial order of knighthood in 1873, was twice an unsuccessful candidate for Parliament for Chatham as a Gladstonian home ruler, although an Ulster Protestant. The colony of Victoria appointed him agent-general in London, and he discharged the duties of that office till his death.

Clayden, Peter William, English clergyman, born in Wallingford, England, Oct. 20, 1827; died in London, Feb. 19, 1902. He was educated in private schools, and was successively pastor of Unitarian congregations in Boston, 1855-'59; Rochdale, 1860; and Nottingham, 1860-'68. He joined the staff of the London Daily News, and remained with that paper for the larger part of the time till 1896. In 1873 he established the Reading Observer, of which he disposed six years later. He was the author of *The Religious Value of the Doctrine of Continuity* (1866); *Scientific Men and Religious Teachers* (1874); *England under Beaconsfield* (1880); *Samuel Sharpe, Egyptologist* (1883); *The Early Life of Samuel Rogers* (1887); *Rogers and his Contemporaries* (1889); and *England under the Coalition* (1892).

Cluysemaer, Alfrid, Belgian painter, born in Brussels, Sept. 24, 1837; died there, Nov. 23, 1902. He was the son of a noted architect, under whose direction he first studied sculpture. The art of

painting attracted him, and after studying at the Academy of Art in Brussels he became a pupil of Léon Cognet and a student at the Paris Ecole des Beaux-Arts. In 1861 he exhibited a picture called *A Dominican Meditating*. He helped decorate the grand saloon in the Casino at Homburg for his father, and then traveled for five years in Holland, Germany, and Italy. In 1865 he exhibited at Brussels a large canvas representing the four horsemen of the Apocalypse. In 1872 he produced a *Mazeppa*, and next his *Vocation*, now in the Brussels Museum. He executed six large mural paintings for the University of Ghent. He exhibited other decorative designs later, but obtained few commissions.

Constant, Benjamin, French painter, born in Paris in 1847; died there, May 26, 1902. He studied in the Ecole des Beaux-Arts under Cabanel, and began to exhibit in the Salon in 1869. His painting was a scene from Hamlet, which he followed with other similar compositions, turning to dramatic subjects from Oriental life and history, which suited his bent for vivid coloring and for the nude. His mastery in flesh-tints led him into portrait-painting, and the coloring and dramatic treatment and majestic idealization of his subjects made him the fashionable painter of Paris and

London. Some of his Oriental pictures are *Mahomet II*; *Les Chérifas*; *Les Funérailles de l'Emir*; and *La Justice du Chérif*, which last is hung in the Luxembourg. He painted in Morocco *Les Favorites*; *Les Femmes du Caïd*; *Les Prisonniers Marocains*; *Le Roi du Désert*; *Une Danse d'Almée*; *La Tigre Favori*; and many interiors and seraglio views. Of religious subjects he treated the resurrection of Lazarus and the entombment of Christ. A large decorative painting represents the entry of Pope Urban II into Toulouse Cathedral. He painted many small landscapes from sketches made in all places where he studied, small marines, and views of Rome, Venice, New York, London, and other cities, none of which were known until about 80 of these smaller works and 140 large paintings were sold in London after his death. His portraits of Mrs. Walters and Madame Calvé were two of the most notable. A portrait of his son was bought for the Luxembourg. In the Salon of 1902 were hung portraits of Lord Savile and M. de Blowitz. He was commissioned to paint for reproduction in an illustrated journal a portrait of Queen Victoria with emblems and accessories suggestive of majesty and empire. This work was exhibited in the Salon of 1900 and in the exhibition of the British Royal Academy in 1901, where it was given an entire wall. He painted also a portrait of Queen Alexandra. Like some of the older artists, and unlike many of the younger generation, he finished his pictures in minute detail, but regarded most their harmonious effect and decorative value.

Cooper, Thomas Sidney, English artist, born in Canterbury, England, Sept. 26, 1803; died there Feb. 7, 1902. His early education was very slender. After some experience as a scene-painter, he

went to London, where he was admitted to the Royal Academy schools. In 1827 he went to Brussels, and became acquainted with the artist Verboeckhaven, whose style he adopted. He settled in London in 1831, where he exhibited at the Suffolk Galleries in 1833 and at the Royal Academy the next year. By this time he had become known as a painter of cattle and rural scenes, and his pictures, appearing regularly at the Royal Academy exhibitions, attracted much attention. He became an associate royal academician in 1845 and a full member in 1867. In 1882 he presented his native city with the Sidney Cooper Gallery of Art. He continued active in his profession till very shortly before his death, sending four pictures to the Royal Academy in 1901. He remained ever faithful to his earliest conceptions of what a picture should be, and his later paintings differ only in execution from his early ones. His style was neat, but essentially artificial, and was based on seventeenth-century traditions. His art was wholly lacking in the principle of growth; it pleased persons of simple tastes who delighted in highly finished canvases representing sunny meadows dotted over with grazing cattle, but it never displayed either fresh study of Nature or spontaneity, and at its best was but an extremely clever imitation. Cooper exhibited at the Royal Academy sixty-seven years without a break. His autobiography, entitled *My Life*, appeared in 1890.

Cornu, Alfred, French physicist, born in Chateaufort, Loiret, March 6, 1841; died April 11, 1902. He entered the Military School of Paris in 1860, and thence went to the School of Mines, which he left in 1866. One year later he was appointed Professor of Physics at the École Polytechnique, which chair he filled to the end of his life. Optics was his favorite study, and the pages of the *Compte Rendus* record papers of his on this subject as early as 1863. Following the work of Jamin, he investigated the relation between vitreous and metallic reflection, and showed that, while they affect different regions of the spectrum, they are but parts of one and the same phenomenon. Soon after receiving his professorship Cornu began those careful and laborious experiments on the speed of light-waves which have become classical. His method, although fundamentally the same as that of Fizeau, was carried out more carefully and with better apparatus, so that he secured a much greater degree of accuracy than his famous predecessor. He was awarded the *prix Lacaze* in 1878 for this work, and in the same year was admitted to the Académie des Sciences. In 1872 several papers of his on electrostatics, in which he discussed the potential theories of Gauss and Green, then little known in France, attracted wide attention. These researches were printed in Vol. I of the *Journal de Physique*. For the next few years he devoted himself to work on the spectrum. He accurately measured the wave-lengths of the hydrogen rays, and made important observations on atmospheric absorption in the spectrum. He was thus able to fix the inferior limit of the ultra-violet end of the spectrum at low elevations, and found that in the laboratory air is opaque to ultra-violet waves of a lesser length than 0.185μ . He did important and interesting work on meteorological optics. It was he who first pointed out the probable origin of the wonderful twilight glows observed in the sky toward the end of 1883 in the volcanic explosions of Krakatoa. They were due to the diffraction caused by the fine powders thrown up for miles into the atmosphere by the mighty forces of the volcano. He did important work on the optical constants of lenses, devised the optical lever for

the measurement of the curvature of lenses, and perfected the Jellet prism for polarimetric work. In conjunction with M. Baille he redetermined the constant of gravitation. Almost every branch of optics is indebted to him for some valuable research or ingenious instrument. He also did important work in connection with the electrical synchronization of clocks. He took part in the first electrical congress in Paris in 1881. He was twice president of the Académie des Sciences, twice president of the Société de Physique, and was unanimously elected president of the International Congress of Physics in 1900. In 1886 he became a member of the Bureau de Longitudes, and in 1900 of the International Commission of Weights and Measures. In 1878 he received the Rumford medal of the English Royal Society, and in 1899 the honorary degree of doctor of science from the University of Cambridge.

Cornwall, James, English educator, born in 1812; died in Sydenham Hill, England, Dec. 12, 1902. When the famous school established by Joseph Lancaster in the Borough Road, London, was reorganized with a training-school attached, under a Government act of 1846, Dr. Cornwall was its first principal. He resigned this post in 1856, and the rest of his life was passed in retirement. He possessed rare gifts as a teacher and lecturer, and was the author of many schoolbooks and manuals which, though now superseded by later works, were far in advance of their contemporaries. A school geography by him reached its nineteenth edition, and his latest work, *The Science of Arithmetic*, attained more than 20 editions.

Cowper, William Macquarie, Anglican clergyman, born in New South Wales, in 1810; died at Sydney, New South Wales, in June, 1902. He was a son of Archdeacon Cowper, for many years incumbent of St. Philip's, Sydney, and was graduated at Oxford in 1833. He was ordained to the priesthood in 1834, and was for a short period curate of St. Petros's parish, Dartmouth. Returning to Australia in 1836, he was for twenty years chaplain to the Australian Agricultural Company at Port Stephen, and in 1856 became president of Moore Theological College and incumbent of St. John's, Bishopsthorpe. He succeeded his father at St. Philip's on the latter's death, in 1858, and at the same time was appointed Dean of Sydney, and also archdeacon in his father's stead. In 1869 he left St. Philip's for the cathedral parish, of which he remained incumbent till his death. Dean Cowper was an authority on all matters pertaining to the Australian Church.

Cowrie, William Garden, Anglican prelate, born in Auchterless, Scotland, in 1831; died in Wellington, New Zealand, June 25, 1902. He was educated at Cambridge, in 1854 was ordained in the English Church, and served as chaplain to Lord Clyde's army at Lucknow in 1858, to Sir Neville Chamberlain's forces against the Afghans in 1863-'64, and to the camp of the Viceroy of India in 1863. He was rector of Stafford, England, in 1867-'69 and became bishop of New Zealand diocese of Auckland in the last-named year. From 1895 he was metropolitan of New Zealand. Bishop Cowrie published *Notes on the Temples of Cashmere*; *A Visit to Norfolk Island*; and *Our Last Year in New Zealand* (1887). He was active in promoting university education in New Zealand, and as governor of St. John's College was instrumental in making it an efficient training-school for the clergy. To his efforts are due the establishment of the Sailors' Home and the Institution for the Blind.

Cox, Sir George William, English historian, born in Benares, Hindustan, Jan. 10, 1827; died

in Walmer, England, Feb. 9, 1902. He was the son of an English army officer in India, and was educated at Oxford. After studying for the Anglican ministry he was admitted to the priesthood in 1851. After holding the curacy of Salcombe Regis, Devon, 1850-'51, and that of St. Paul's Church, Exeter, 1854-'57, he was an assistant master in Cheltenham College, 1860-'61. He was subsequently literary adviser to the London publishing house of Longmans, 1861-'85; vicar of Bekebourne, Kent, 1881; rector of Scrayingham, in the East Riding of Yorkshire, 1881-'97. For more than twenty years he was a frequent contributor to the *Edinburgh Review*, the *Saturday Review*, and other periodicals, and while joint editor with Prof. Brande of the *Dictionary of Science, Literature, and Art* he made many contributions to that work. On the death of an uncle in 1877 he succeeded to the baronetcy, but there was another claimant of the title. His histories, prepared to meet the needs of special occasions, probably have only ephemeral value, but they served well an immediate purpose and are accurate as well as readable. His life of Bishop Colenso is perhaps his most important piece of literary work. Its avowed purpose is to lay before the world a complete vindication of Colenso's words and acts, and to record that the bishop's method and conclusions find justifications in the series of judgments pronounced in the courts of the Established Church. Personally the biographer was in full sympathy with the opinions of the Bishop of Natal. He resigned the living of Scrayingham on account of failing health. His published books comprise *Poems Legendary and Historical* (with the historian Freeman) (1850); *Life of St. Boniface* (1853); *Tales from Greek Mythology* (1861); *The Tale of the Great Persian War, from Herodotus* (1861); *Tales of the Gods and Heroes* (1862); *Tales of Thebes and Argos* (1864); *A Manual of Mythology* (1867); *Tales of Ancient Greece* (1868); *The Mythology of the Aryan Nations* (1870); *Latin and Teutonic Christendom* (1870); *Popular Romances of the Middle Ages* (with E. H. Jones) (1871); *Tales of the Teutonic Lands* (with E. H. Jones) (1872); *A History of Greece* (1874); *The Crusades* (1874); *The Greeks and Persians* (1876); *The Athenian Empire*, issued in the *Epochs of Modern History* series, as were the two preceding volumes (1876); *A General History of Greece*, an enlargement of the earlier work (1876); *History of the Establishment of British Rule in India* (1881); *The Little Cyclopædia of Common Things* (1881); *An Introduction to the Science of Comparative Mythology and Folk-Lore* (1881); *Short Historical Anecdotes* (1882); *Lives of Greek Statesmen: Solon, Themistokles* (1885); *Concise History of England and the English People* (1886); *Lives of Greek Statesmen, Second Series: Ephialtes, Hermokrates* (1886); *The Life of John William Colenso, Bishop of Natal* (1888); *The Church of England and the Teaching of Bishop Colenso* (1888). His *Little Cyclopædia of Common Things* was simply a bold appropriation, bodily, of the *Young Folks' Cyclopædia of Common Things*, which was devised and written by John D. Champlin, and was published in New York in 1880.

Croke, Thomas William, Irish Roman Catholic prelate, born in Mallow, County Cork, May 19, 1824; died in Thurles, July 22, 1902. He was the son of a prosperous farmer, and although his mother was a Protestant, his uncle, who took charge of his education and destined him for the priesthood, sent him to the Irish College at Paris in 1838, where he remained till he was twenty, after which he spent a year in the seminary at

Menim, in Belgium, and finished his ecclesiastical training with three years of study in the Irish College at Rome, where he took the degree of doctor of divinity in 1848 and was ordained priest. Returning to Ireland, he was Professor of Rhetoric in the diocesan college at Carlow, which he left to take the chair of Theology in the Irish college at Paris, from which he went back to his native diocese as a missionary priest. He was assigned to the presidency of St. Colman's College, at Fermoy, in 1858, and filled that position till 1865, when he resumed pastoral work as parish priest of Doneraile. In 1870 he was appointed Bishop of Auckland, New Zealand, and in 1875 he was recalled to Ireland to be Archbishop of Cashel and Emly. The parish priests of the see, whose own three nominations had all been disregarded by the Holy See by advice of Cardinal Cullen, had no welcome for their cosmopolitan and unknown metropolitan until he won the hearts of the people and the name of the patriot archbishop by a rousing Irish speech at the O'Connell centennial celebration in 1875. Dr. Croke had once taken an interest in Irish politics, while he was a curate in the Cloyne diocese, entering into Gavan Duffy's agitation for fixity of tenure, fair rents, and free sale, and when that brief movement was destroyed by jealousy and chicanery he declared that he would never engage in another agitation for national independence or land reform. In 1879 he was induced by Charles Stewart Parnell to give his support to the Land League, and became the most earnest and active Land Leaguer in the Roman Catholic hierarchy. He condemned the no-rent manifesto, thinking a refusal to pay taxes to the Government, not the refusal to pay rent to landlords, the proper answer to the proscription of the Land League. Still he clung to the cause and advocated a national testimonial to Parnell, unmoved by a papal rebuke. When a scandal in Parnell's private life was disclosed in the courts Dr. Croke drew up an address to the Irish people declaring that Mr. Parnell was unfit to be their leader, and all the members of the hierarchy signed it simultaneously with Mr. Gladstone's demand for the deposition of the head of the home-rule party for his immorality. After that Dr. Croke withdrew from politics and declined every appeal to him to try to settle the differences between Parnellites and anti-Parnellites and between O'Brienites and Healyites. Dr. Croke, a man of great stature and powerful build, who in his young days was a champion jumper and noted in hurling and football, took a keen interest in the national sports and pastimes of the Irish people, and in 1885 accepted the presidency of the Gaelic Association for the revival of old Irish games. Despite his scholastic training, he had a contempt for pedantry and little taste for dry learning. He was a man of action, engrossed in the life of the present and the development of the future, and was exceedingly hospitable and companionable, with a fund of Irish humor.

Dalou, Jules, French sculptor, born in Paris in 1838; died there, April 15, 1902. He studied under Abel de Pujol, Duret, and Carpeaux, having entered the *École des Beaux-Arts* in 1853. In 1861 he exhibited the *Dame Romaine jouant aux Osselets*. He joined the Commune, and was instrumental with Barbet de Jouy in saving the art collections of Paris. When the Versailles Government triumphed he fled to London. In 1873 he returned and exhibited once more at the Salon. One of his famous works is a bas-relief in the *Palais Bourbon* representing Mirabeau replying to M. de Dreux-Brézé. Another is the *Triomphe*

de la République, erected in the Place de la République in 1899. A bronze group entitled *Triomphe de Silène* is placed in the Luxembourg gardens. He made a statue of Victor Noir that was greatly admired, and just before his death he completed one of Gambetta.

Dalziel, George, English wood-engraver, born in Northumberland in 1816; died in Hampstead, Aug. 7, 1902. He was the son of an artist and was a master of his branch when he established himself in London, where he was joined by his two brothers, whom he took into partnership. The Dalziels led in the movement for illustrated books, engaging the ablest artists in England to draw the blocks for them to engrave. These books and pictures exemplifying the highest achievement of the art of illustration and wood-engraving in Great Britain are now sought by art collectors. Birket Foster's *Pictures of English Landscape* they printed in 1863, and in 1864 *Parables of Our Lord*, with drawings by Millais. In 1865 they published the *Arabian Nights* with a multitude of illustrations drawn by Boyd, Houghton, Millais, Tenniel, Pinwell, and Thomas Dalziel. The last of the famous books on which artists and engravers worked in harmonious co-operation was the *Bible Gallery*, printed in 1881, to which Ford Madox Brown, Frederick Leighton, Frederick Sandys, Edward Poynter, Edward Burne-Jones, and Simeon Solomon contributed. Many of their engravings appeared in *Good Words*, *Once a Week*, and other magazines.

Damour, M., French mineralogist, born in Paris, July 19, 1806; died there, Sept. 21, 1902. He early became a director in the Department of Foreign Affairs, but in 1854 resigned his office to devote his time to scientific research. He made many voyages for the purpose of scientific exploration to Central America and to the Antilles. He left an unusually extensive and rich collection of instruments of the stone age. He was named a correspondent of the French Academy of Sciences in 1862, and a *membre libre* in 1878. He had been an officer of the Legion of Honor since 1854. One of his most important memoirs was that on the *Composition des haches en pierre trouvées dans les tombeaux celtiques et chez les tribus sauvages*.

Davidson, Andrew Bruce, Scottish scholar, born in Ellon, Scotland, in 1840; died Jan. 26, 1902. He was educated at Marischal College, Aberdeen, and after studying for the ministry of the Free Church of Scotland, was ordained in 1863. In the same year he became Professor of Hebrew, and he held that office at the time of his death. He had long been accounted in the first rank of Hebrew scholars, and was a member of the Old Testament Revision Committee. He published a *Commentary on the Book of Job* (1862); *Introductory Hebrew Grammar*, a standard authority (1874); and *Hebrew Syntax*.

Dearden, Henry Woodhouse, English clergyman, born about 1829; died in Cambridge, England, Feb. 24, 1902. He was educated at Trinity College, Dublin, and was ordained to the priesthood in 1854. He was curate of Platts, Kent, in 1853-'55, and of Loose, near Maidstone, in the same shire, 1855-'60. From 1860 to 1877 he was vicar of St. Paul's parish, at Maidstone; incumbent of St. John's, Upper Holloway, 1877-'87; and from 1887 to 1893 he held a living in Southborough, Kent. He retired from active duties in the year last named, but in more recent years assisted as curate in the Church of St. Sepulcher, Cambridge. He was a strong evangelical in his sympathies, and his *Church Teaching* (1896) has been widely circulated among Low Church-

men. He was also the author of a book entitled *Modern Romanism*.

Desboutin, Marcellin, French engraver, born in 1823; died in Nice, Feb. 18, 1902. He was educated for the law and obtained his university degree, but instead of following that profession he entered the studio of Couture in 1847, and when he left that master he went to Italy and remained eighteen years. On his return to Paris he painted portraits in a most effective manner, one of himself being in the Luxembourg. His chief fame, however, rests on his engravings, notably dry-paint portraits of many celebrated artists and writers, and his reproduction of the *Fragonards of Grasse*. He was also a dramatic poet, author with Jules Amigues of *Maurice de Saxe*, produced in 1870, a drama in verse. His *Cardinal Dubois* and *Madame Roland* have not yet been acted.

De Vere, Aubrey Thomas, Irish poet, born in Limerick, Ireland, Jan. 10, 1814; died there, Jan. 21, 1902. He was the third son of Sir Aubrey De Vere, a distinguished poet, and received his education at Trinity College, Dublin. He was trained in the Protestant faith, but in 1851 became a Roman Catholic. De Vere's poetry was much admired by the poets of the elder generation who were his contemporaries, and it has also won the praise of the more scholarly and thoughtful poets of to-day; but it makes no strong appeal to the average reader. As a prose writer he was both animated and suggestive, and his essays, whether political or purely literary, are worthy of careful reading. His work in verse includes *The Waldenses* (1842); *The Search after Proserpine*, a classical masque, and *Other Poems* (1843); *Poems: Miscellaneous and Sacred* (1853); *May Carols, or Ancilla Domini* (1857-'81); *The Sisters, Innisfail, and Other Poems* (1861); *The Infant's Bridal, and Other Poems* (1864); *Irish Odes, and Other Poems* (1869); *Legends of St. Patrick* (1872); *Alexander the Great: A Dramatic Poem*, often compared to Henry Taylor's *Philip Van Artevelde* (1874); *St. Thomas of Canterbury: A Dramatic Poem* (1876); *Antar and Zara* (1877); *Legends of the Saxon Saints* (1879); *St. Peter's Chains, or Rome and the Italian Revolution* (1880); *The Foray of Queen Meave and Other Legends of Ireland's Heroic Age* (1882); *Legends and Records of the Church and the Empire* (1887). In prose De Vere published the following volumes: *English Misrule and Irish Misdeeds* (1848); *Pictureque Sketches of Greece and Turkey* (1850); *Ireland's Church Property and the Right Use of It* (1867); *Pleas for Secularization* (1867); *The Church Establishment of Ireland* (1867); *The Church Settlement of Ireland, or Hiberna Pacanda* (1868); *Proteus and Antæus: A Correspondence* (edited) (1878); *Constitutional and Unconstitutional Political Action* (1881); *Ireland and Proportional Representation* (1885); *Essays, Chiefly on Poetry* (1887); *Essays, Chiefly Literary and Ethical* (1889); and *Recollections* (1897).

Doel, James, English actor, born in Maiden Bradley, England, in 1804; died in Plymouth, England, Aug. 29, 1902, being then the oldest actor of the English-speaking stage. He made his theatrical *début* at the Adelphi Theater, London, in 1820, and his last appearance was at a performance for his benefit in London, in 1892. He was a contemporary of Edmund Kean, of Macready, and of Phelps, and in many of the famous old English stock companies he appeared in support of nearly all the celebrated actors of the last century. He acted the *First Gravedigger* to Edmund Kean's *Hamlet*, and was the *First Witch* in

Macready's production of *Macbeth*. His theatrical experience went as far back as a performance of *The Hunchback*, when he acted Fathom to the Master Walter of Sheridan Knowles, author of the play. He also appeared in support of Charlotte Cushman and Fanny Kemble. After he left London he became the manager of a theater in Devonport, and in a few years he owned a circuit of theaters in Torquay, Exeter, and Teignmouth. All the famous actors of the day appeared in those theaters, including Mme. Vestris and Charles Mathews, who played under his management just after their marriage. In his later years Mr. Doel became the idol of the theatrical profession in his own country, and in 1897, at the time of the great jubilee, Queen Victoria showed him special honor, as being the oldest living English actor.

Dunkin, Bryan, English engineer, born in 1835; died March 4, 1902. He was educated at University College, London, and at the *École Centrale des Arts et Métiers*, in Paris. He was then apprenticed in the large paper-making machinery works of his uncle at Bermondsey. In 1868 he became a partner in the firm. His claim to scientific recognition rests on his experimental work in thermodynamics. He carried out extensive researches on the action of the steam-engine and devised the "steam-revealer" that bears his name. In his later years he gave much attention to internal-combustion motors, and wrote a work on the Gas-Engine. He also translated Diesel's book on *The Theory and Construction of the Rational Heat Motor*.

Donnelly, Sir John Fretcheville, English military engineer, born in 1834; died April 5, 1902. He will be best remembered for his promotion of governmental schemes of scientific education. He served in the Crimean War as a lieutenant of engineers, and after it was appointed to the charge of a detachment of the same body quartered at South Kensington Museum, London. About 1869 he succeeded Lord Playfair as inspector of science. He was an indefatigable worker in extending the usefulness of the department of science at the museum, which now has more than 2,000 classes, attended by 160,000 students. He assisted in reorganizing the old Royal College of Chemistry, in Oxford Street and the School of Mines in Jermyn Street, which in 1890 became the Royal College of Science. It was largely through his untiring perseverance that the grant of £200,000 was obtained for the completion of the science and art buildings at South Kensington.

Dosabhoj, Framjee, Indian official and journalist, born in Sairat, May 18, 1830; died in Bombay, March 17, 1902. He was a Parsi, and was educated in the Elphinstone Institution and the College of Bombay, received a Government clerkship, resigned to devote himself to journalism, and in five years became manager of the *Bombay Times*, being the first native to manage an English newspaper. When the gag act was passed in 1857 he was appointed censor of the vernacular press. In 1864 he was made a magistrate. He was the first native chairman of the corporation of Bombay. In 1858 he visited England to publish a book on *The Parsis*.

Duckett, Sir Floyd, English archaeologist, born in 1811; died May 13, 1902. He was widely known for his archaeological researches, and received in 1893 the special gold medal of honor from France in acknowledgment of his services in archaeology. Besides many antiquarian publications, such as the *Record Existence of the Order of Cluni in England*, he was the author of a

Technological Military Dictionary (1848) in German, English, and French, which gained him gold medals from Austria, Prussia, and France, and *Reminiscences* (1894). In 1888 he was appointed an officer of public instruction in France. Sir Floyd was educated at Harrow and at Oxford, and succeeded his father as third baronet in 1856.

Dufferin and Ava, Frederick Temple Hamilton-Temple Blackwood, Marquis of, Irish diplomatist and author, born in Ireland, June 21, 1826; died in Clanboye, County Down, Ireland, Feb. 12, 1902. His mother, Lady Dufferin, was a granddaughter of Richard Brinsley Sheridan, and was well known as a poet. The son was educated at Oxford. He was sent on a Government mission to Vienna in 1855, and to Syria in 1859-'60. He was Under-Secretary of State for India in 1864-'66; and Under-Secretary of War for India in 1866; chancellor of the Duchy of Lancaster in 1868; and Governor-General of Canada in 1872-'79. He was appointed ambassador to Russia in 1879, and to Turkey in 1881, special commissioner to Egypt in 1882, and Governor-General of India in 1884. He served as ambassador to Italy in 1888, to France in 1891, and was lord warden of the Cinque Ports in 1891-'96. Harvard University gave him the degree of LL. D. in 1878, and he was lord rector of St. Andrew's University in 1890-'93. His writings comprise *Letters from High Latitudes* (1856); *Irish Emigration and the Tenure of Land in Ireland* (1867); *Mr. Mill's Plan for the Pacification of Ireland Examined* (1868); *Speeches and Addresses* (1882); and *Speeches delivered in India* (1890).

Durand, Mme. Alice Mary Céleste (Fleury), "Henri Gréville," a French novelist, born in Paris, Oct. 12, 1842; died there, May 26, 1902. She was educated at home, and when at fourteen she accompanied her father, Prof. Fleury, to St. Petersburg, she was familiar with several languages. She began early to write novels and tales of Russian life, and this she continued to do after her marriage with M. Durand, a French Professor of Law. On her return to France in 1872, Mme. Durand began to contribute to the *Revue des Deux Mondes*, *Le Temps*, and other high-class periodicals. In 1886 she visited the United States with her husband, and several of her novels, republished in this country, were widely read here. Her published books, which appeared with the pseudonym Henri Gréville, include *A Travers Champs* (1872); *Dosia* (1876); *L'Expiation de Savelli* (1876); *La Princesse Ogheff* (1876); *Les Koumissassine* (1877); *Suzanne Normis* (1877); *Sonia* (1877); *La Maison de Maurèze* (1877); *Nouvelles Russes* (1877); *Les Épreuves de Raissa* (1877); *L'Amie* (1878); *Le Violon Russe* (1879); *Cité Ménard* (1880); *L'Héritage de Xénie* (1880); *Le Moulin Frappier* (1880); *Les Degrés de l'Échelle* (1881); *Madame de Dreux* (1881); *Perdue* (1881); *Le Fiancé de Sylvie* (1882); *Rose Rozier* (1882); *Une Trahison* (1882); *Manuel d'Instruction Civique et Morale des Jeunes Filles* (1882);

Angèle (1883); *L'Ingénue* (1883); Louis Breuil (1883); *Un Crime* (1884); *Les Ormes* (1884); *Idylles* (1885); *Clairefontaine* (1885); *Le Mors aux Dents* (1885); *Cléopâtre* (1886); *Le Comte Xavier* (1886); *La Fille de Dosia* (1887); *Nicanor* (1887); *Frank* (1887); *Comédies de Paravent* (1888); *Le Seconde Mère* (1888); *L'Avenir d'Aline* (1889); *Chant de Noces* (1889); *Le Passé* (1890); *Un Mystère* (1890); *Aurette* (1891); *Péril* (1891); and *L'Héritière* (1891).

Escobedo, Mariano, Mexican soldier, born in 1827; died in Tacubaya, May 22, 1902. He was originally a muleteer. In the war with the United States he was an active guerrilla chief who attacked small detachments of the American army and fought with his band in the battles of Palo Alto and Resaca. In the war against the Clericals and French he raised a body which fought the troops of Gen. Miramon, was commissioned colonel in 1859, and advanced to brigadier-general in 1861, when the Government of Gen. Juarez was established, and pursued the remnant of the Clerical forces under Gen. Marquez and Gen. Mejia, but was captured by the enemy, and escaped with difficulty when ordered to be shot. He took part in most of the engagements with the invading French forces, fled to Texas when the empire was established, organized and equipped an expedition among the refugee republicans with which he entered Mexico in 1865 and swept all before him, was appointed by President Juarez commander-in-chief of the Army of the North, continued his victories until all the principal cities were in the hands of the Republicans, and finally received the surrender of the Emperor Maximilian at Queretaro on May 15, 1867. He quelled an uprising against the Government of Juarez in 1874, and when a revolution was started by Gen. Diaz he was appointed Secretary of War to organize resistance, in which he was unsuccessful. Taking refuge in Texas, he issued a manifesto calling for volunteers to overthrow the Government of President Diaz. He was arrested and tried when he returned to Mexico later, and though acquitted, he was held in confinement until he obtained his liberty in 1879 by pleading ill health and went to New York. Returning to Mexico later, he was appointed to a Government office, which he resigned in 1883.

Eyre, Charles, Roman Catholic prelate, in Scotland, born in Arkan, Bryan Hill, York, in 1817; died in Glasgow, March 28, 1902. He studied for the Roman Catholic priesthood at Ushaw College, Durham, and at Rome, becoming assistant priest at St. Andrew's, in Newcastle, in 1843, and senior priest of the cathedral in the same city in 1849. In 1857 he was appointed archbishop for the western district of Scotland, receiving the title of Archbishop of Glasgow. In 1874 he founded a diocesan seminary at Glasgow for the study of philosophy and theology. Archbishop Eyre was well known as an antiquary. He was the author of *The History of St. Cuthbert* (1849); *Children of the Bible*; and *Papers on the Old Cathedral of Glasgow*.

Faed, John, Scottish artist, born in Burley Mill, Kirkcudbright, Scotland, in 1820; died in Gatehouse-of-Fleet, Scotland, Oct. 22, 1902. He became a miniature painter when little more than twelve years old. At nineteen he went to Edinburgh, and, establishing himself there as a miniaturist, soon met with great success. In a few years he sent for his brother Thomas to study art, which the younger man did to such good purpose that he became famous as a genre painter. He died in 1901. Another brother presently went to

Edinburgh, to be known later as James Faed, the engraver. John Faed began to exhibit at the Royal Scottish Academy in 1841, and about this time took up oil-painting. In 1848 he was elected an associate of the Scottish Academy, and he became a full member in 1851. His subjects were found in history, the poets, and homely country life, his early training as a miniaturist making itself apparent in his canvases in great precision of outline, and his paintings, while always carefully drawn, are somewhat hard in color. Among noteworthy pictures by him are *Boyhood* (1850); *The Cruel Sisters* (1851); *The Cottar's Saturday Night* (1854); *Reason and Faith* (1855); *Job and his Friends* (1858); *Boaz and Ruth* (1860); *Rosalind and Orlando*; *Olivia and Viola*; and *Shakespeare and his Contemporaries*. In 1862 Faed removed to London, where he resided eighteen years, exhibiting regularly at the Royal Academy. Such works as *John Anderson, my Jo*, *The Morning before Flodden*, *The Old Basket-Maker*, and *Annie's Tryst* belong to the period of his London sojourn. He retired to Gatehouse in 1880, but still continued to paint, several pictures of the scenery along the Fleet being numbered among the works of his latest years.

Faye, Hervé Auguste Étienne, French astronomer and meteorologist, born in Saint-Bénott-du-Sault, Indre, Oct. 5, 1814; died in Passy, July 4, 1902. He entered the Polytechnic School, but soon left his studies to take charge of a large industrial establishment in Holland. He first came prominently before the scientific world in November, 1845, as the discoverer of the comet that bears his name. He was at this time an assistant in the Paris Observatory. In cosmical physics and chemistry he was a pioneer, and if his theories have not always been justified by later research, they are always philosophical and suggestive. Indeed, his philosophic writings are those on which his reputation among his own countrymen chiefly rests. He wrote several volumes, the two best known of which are *Sur l'Origine du Monde* and *Cours d'Astronomie Nautique*. He was called by Marshal MacMahon to fill the office of Minister of Instruction in his Cabinet.

Filhol, Pierre Antoine Henri, French naturalist, born in Toulouse in 1843; died April 28, 1902. He was the son of the famous chemist Édouard Filhol, studied medicine, and obtained his degree at an early age. He soon became a close student of paleontology and comparative anatomy, and in 1863 made his first contribution to science in a paper, *L'Âge de la Pierre dans les Cavernes de la Vallée de Tarascon (Ariège)*, published in the *Compte Rendus*, LVII. He was a member of the French Commission sent out to study the transit of Venus in 1875. In 1876 he received the Lalande-Guerineau prize of the French Academy of Sciences; was awarded the gold medal of the Scientific Congress of the Sorbonne in 1879; the Petit-d'Hormoy prize in 1883; and received the decoration of the Legion of Honor in 1886. He at one time held the chair of Zoology in the Faculty of Sciences of Toulouse. In 1885 he became subdirector, and subsequently director, of the Museum of Natural History in Paris, and was finally appointed to the professorship of Comparative Anatomy, which post he held until his death. Among his most important scientific memoirs are *Recherches sur les Phosphorites du Quercy*; *Études des Mammifères Fossiles de Saint Geraud le Puy (Allier)*; *Étude des Mammifères Fossiles de Ronzon*; *Études sur Mammifères Fossiles de Sausan*; *La Vie au Fond des Mers*; *Faune des Crustacés de la Nouvelle-Zélande*; *Zoologie Descriptive*, and, in conjunction with M.

Grandidier, *Observations Relatives aux Ossements d'Hippopotames trouvés dans le Marais d'Amboliatra à Madagascar*. Also, the catalogue of the Royal Society mentions more than 50 papers of his published before 1883.

Footman, Henry, English clergyman and author, born in Ipswich, England, in 1831; died Dec. 3, 1902. He was educated at Cambridge, prepared for the Anglican ministry, and was admitted to the priesthood in 1871. He was curate at Hungerford, 1871-'73, and at Kensington, 1873-'75; vicar of Lambourn, 1875-'78; curate at St. George's, Camden Hill, London, 1878-'80; vicar of Shoreditch, London, 1880-'81; and vicar of Notten from 1881 till his death. In 1897 he received a canonry in Lincoln Cathedral. Canon Footman was twice select preacher at Cambridge, and was often invited to preach at Westminster Abbey. He was a moderate High Churchman, actively interested in social and economic questions, and was a vigorous preacher. He was the author of *Life: Its Friends and Foes* (1873); *From Home and Back, or Some Aspects of Sin as seen in the Light of the Parable of the Prodigal* (1876); *The Eloquence of the Cross* (1877); *Nature and Prevalence of Modern Unbelief* (1881); *Reasonable Apprehensions and Reassuring Hints* (1883), a work that has been widely circulated; *Ethics and Theology* (1887); and *Aspects and Retrospects* (1897).

Francisco d'Assisi, ex-King of Spain, born May 13, 1822; died April 17, 1902. Don Francisco was the son of the Infante Francisco de Paula, Duke of Cadiz, a brother of King Ferdinand VII, and of the Infanta Luisa, daughter of Francis I, King of the Two Sicilies. He was married on Oct. 10, 1846, to Queen Isabella II, his cousin, who bestowed on him the title of King by courtesy, and appointed him captain-general of the army. His army rank also was merely titular, for he had no gift for either military affairs or for government, but was of a religious bent, and his marriage proved an empty form, for the youthful Queen of Spain could not endure him, and he lived most of the time in retirement in the cloister of Calatrava. He accompanied the Queen in 1868 when she went to San Sebastian to arrange a treaty with the Emperor Napoleon III for the despatch of Spanish troops to Rome for the protection of the Pope in case the French garrison were withdrawn in the event of a war between France and Germany. The revolution which broke out in Cadiz simultaneously with the meeting of the monarchs compelled Queen Isabella to flee the country. She went with her consort to Paris, where in 1870 she formally abdicated in favor of her son Alfonso. At the same time she arranged a separation from her husband, allowing him an income on which he lived in a fine villa at Epinay, while she maintained a large mansion in Paris.

Fuchs, Lazarus, German mathematician, born in Moschin, Posen, May 15, 1833; died April 26, 1902. He early devoted his attention to mathematics, and became extraordinary professor at Berlin in 1866, ordinary professor at Greifswald in 1869, at Göttingen in 1874, at Heidelberg in 1875, and finally at Berlin in 1884. He is chiefly famous for his work in connection with the theory of linear differential equations, to the study of which he attracted attention by his famous memoir published in *Crelles Journal* (vol. lxvi). Among his important contributions to mathematical literature are his researches on linear equations with algebraic integrals, on constructing linear equations the integrals of which have assigned singularities, and on equations the integrals of which have algebraic relations.

Gace, Frederick Aubert, English clergyman, born in 1811; died in Barling, England, Dec. 10, 1902. He was graduated at Oxford in 1837, and was admitted to the priesthood of the Anglican Church in 1838. After serving as curate in several places, was appointed chaplain of the Westminster House of Correction in 1854, and head master of Camberwell Grammar School, London, in 1860. In 1863 he received the living of Barling Magna, Essex, and was rector there until his death. Although holding advanced High-Church opinions, he resembled Dr. Pusey in his indifference to points of ritual, and insisted on preaching in the black gown to the last. In 1870 he published *Some Questions of the Church Catechism and Doctrines Involved*, briefly Explained, a work that excited much attention and was wittily paraphrased in *Punch*. His other published works are *A Complete View of the Holy Eucharist, Doctrinal, Practical, and Controversial* (1871); and *The Arithmetic of Abstract Numbers* (1875).

Gagneur, Mme. Marie Louise (Mignerot), French novelist, born at Domblans, in the Jura, France, about 1831; died in Paris, Feb. 17, 1902. She began to write early, and an essay by her upon trades-unionism, written at eighteen, attracted the notice of Vladimir Gagneur, a member of the Chamber of Deputies, who shortly afterward married her. She was an ardent republican even in the days of the third empire, and her various romances were extremely popular, especially with the socialists and anticlericals. She had an easy, fluent style, and her pages were not lacking in partizan vigor and color. For several years before her death she had been ranked among the most gifted of the Frenchwomen of the last half-century, and in 1901 she received the decoration of the Legion of Honor. Her writings comprise *Une Expiation* (1859); *Un Femme hors Ligne* (1862); *Un Drame Electoral* (1863); *La Croisade Noir* (1865); *Le Calvaire des Femmes* (1867); *Les Réprouvés* (1867); *Les Forçats de Mariage* (1869); *Chair à Canon* (1872); *La Politique au Village* (1874); *Les Droits du Mari* (1876); *Le Roman d'un Prêtre*, which, appearing in weekly instalments in a Paris journal, was seized by the press censors at the nineteenth instalment (1876); *Le Divorce* (1877); *Les Vierges Russes* (1880); *La Fournaise* (1884); *Jean Caboche*; *Les Chevaliers du Sacristie*; and *M. le Baron Pirouette*.

Gardiner, Samuel Rawson, English historian, born in Ropley, Hampshire, England, March 4, 1829; died in Sevenoaks, Kent, Feb. 24, 1902. He was educated at Winchester and Oxford, but resigned his studentship in the university in his junior year upon finding that a degree would not be conferred on him on account of his having become an Irvingite. More than thirty years later he received his degree. He married and settled in London, and soon began the great task he had set himself, the preparation of a history of England from 1603 to 1689. Not being possessed of independent means, he was obliged during the continuance of this undertaking to engage in teaching, and his non-professional hours were all that he was able to devote to research and writing. He was Professor of History at University College, London, in 1871-'85, historical lecturer for the University Extension Society in 1880-'94, Ford lecturer at Oxford in 1896, and examiner in history for London University till 1901, and examiner in the Final History School at Oxford in 1888-'89. The first instalment of his history appeared in 1863, entitled *A History of England from the Accession of James I to the*

Diagnose of Chief-Justice Coke, 1603-'16. It was followed by Prince Charles and the Spanish Marriage, 1616-'24 (1869); A History of England under the Duke of Buckingham and Charles I, 1624-'28 (1875); The Personal Government of Charles I, 1628-'37 (1877); The Fall of the Monarchy of Charles I, 1637-'42 (1881).

Each instalment filled 2 volumes, and a second edition in 10 volumes, bearing the title A History of England from the Accession of James I to the Outbreak of the Civil War, was issued in 1883. The history was at first very coldly received by the public, the successive volumes having scarcely any sale; but, wholly unde-

terred by this circumstance, the author took up the second division of his task, A History of the Great Civil War, 1642-'49, which appeared at intervals from 1896 to 1891. The third and last division, A History of the Commonwealth and the Protectorate, 1649-'60, appeared in 3 volumes, 1884-'91. Two more had been originally contemplated, but Prof. Gardiner decided to conclude with the death of Cromwell, instead of with the Restoration, and thus bring this portion of the book within the limits of 4 volumes. The fourth volume he had arranged with his literary executor, Dr. Firth, to complete. In addition to his great work Prof. Gardiner published The Thirty Years' War (1874), The First Two Stuarts and the Puritan Revolution (1876), both contributions to the Epochs of Modern History Series; Outline of English History (1881-'83); Introduction to English History (with B. Mullingar) (1881); A Student's History of England (1884); Constitutional Documents of the Puritan Revolution (1888); Cromwell's Place in History (1897); What Gunpowder Plot Was (1897); Oliver Cromwell (1899). He edited Letters and Papers Illustrating the Relations between Charles II and Scotland in 1650 (1894); Letters and Papers relating to the Dutch War (1890); and beside contributing very many lengthy articles to the Dictionary of National Biography edited the English Historical Review, 1890-1901, to which he also contributed. In the course of his researches he examined the national archives of France, Spain, Italy, and the Netherlands, and at the Record Office made himself acquainted with the originals of the state papers, and the uncalendared state papers foreign, mastering, in order to accomplish this last task, the Spanish, Dutch, French, Italian, German, and Swedish languages. He never allowed himself to describe a battle without having personally inspected the field or learned all that might be gleaned from local antiquaries. His aim was to view events from the standard of the contemporary observer, and thus to treat history progressively rather than retrospectively. In this he was not entirely successful. As one critic has aptly phrased it, "his work discloses a combination of (1) the most absolutely truthful and sincere process of deduction of fact; (2) broad, luminous, and skilled historical exposition." Prof. Gardiner's

services to historical literature it would not be easy to overestimate. On no occasion was he ever swayed by either sentiment or prejudice. Personally, his political opinions are known to have been Liberal; but in all his writing he is so strictly impartial that from it no one could be certain of the direction of his likings. "History in his eyes," observes one careful student of his writings, "was not a repertory of argument to be used in polemic and debate for the furtherance of any political or religious end. It was the road to truth alone." It may be said in all sincerity that in his native country there never has been a more single-minded or more enthusiastic lover of historic truth than Prof. Gardiner. He cared very little for any display of rhetoric, and troubled himself not at all concerning style, but as his great work progressed he gradually acquired a style both luminous and orderly, and not infrequently impressive. On the death of Froude, Prof. Gardiner was invited to succeed him as Professor of Modern History at Oxford, but the invitation was declined from the fear that the duties of the chair would interfere with the completion of his history. "If there is one man," writes Grant Robertson, "who by the appeal to the inexorable tribunal of truth, without a word that could wound or an epithet imputable to party passion, has taught two generations what Puritan England tried to be, the hopes and dreams, the failures and successes, of its men and women, what it was in all its weakness and all its matchless strength, that man is Samuel Rawson Gardiner."

Garland, George Vallis, English clergyman, born in 1823; died at Boscombe, England, Dec. 24, 1902. He was educated at Cambridge, and after preparing for the Anglican ministry was admitted to the priesthood in 1850. He was curate of Crowle, Lincolnshire, 1850-'52; director of Langton Matravers, 1852-'69; vicar of Aslacton, 1869-'75; and rector of Binestead, Isle of Wight, 1881-'94. He was the author of Plain Possible Solutions of the Objections of Right Rev. J. W. Colenso (1863); Remarks on the Vision of the Four Chariots of Zechariah (1869); Genesis with Notes (1875); The Compatibility of the Eternity of Matter with the Existence of God (1881); and The Practical Teaching of the Apocalypse.

Gall, Frederick, English colonial prelate, born in 1821; died in Cuford, Coonor, India, March 23, 1902. He was educated at Cambridge, and in 1843 was admitted to orders. He held a curacy at Great St. Mary's in the university town, 1844-'45. From 1849 to 1859 he was lecturer, dean, and assistant tutor at Christ Church, Cambridge, and for the two years succeeding was domestic chaplain to the Bishop of London. In 1861 he was consecrated Bishop of Madras, his long and arduous episcopate continuing until his resignation in 1898.

Giani, Demeter, Roumanian statesman, born in 1838; died July 16, 1902. He studied at Berlin and Paris, practised law after his return, was elected Deputy in 1866, but resigned rather than take the oath of allegiance under the statute suspending the Constitution, was elected again in 1868, joined the Liberal party, successfully opposed the design of the ministry of Lascar Catargi to arrest and prosecute the ministry of 1876, was a member of the Constituent Assembly of 1876 and the author of the law of ministerial responsibility, held the portfolio of Justice in the Brătianu Cabinets of 1880 and 1887, and was the author of many important laws. Under the Sturdza administration in 1896 he was president of the Chamber.

Gilbert, Sir Joseph Henry, English agricultural chemist, born in Hull, Aug. 1, 1817; died Dec. 23, 1902. He was the son of a clergyman and studied chemistry in Glasgow University, University College, London, and under Liebig at Giessen. He was assistant to Prof. Anthony Todd Thomson in University College in 1840, went to Manchester to experiment in cotton dyes, and in 1843 became the associate of J. B. Lawes in the experimental farm at Rothamstead. Together they experimented in soils, fertilizers, and selection of seed, and published the results in over a hundred papers. He journeyed in the United States and Canada in 1882 and 1884 to study the conditions of agriculture in America. On the fiftieth anniversary of the Rothamstead experiments he was knighted, and in 1884 he was appointed Professor of Rural Economy at Oxford.

Gladstone, John Hall, English chemist and educator, born in London in 1827; died Oct. 6, 1902. He was educated at University College, London, and at the University of Giessen. In 1850 he became lecturer in chemistry at St. Thomas's Hospital, and three years later was elected a fellow of the Royal Society. He held the Fullerian professorship of Chemistry at the Royal Institution from 1874 to 1877; was first president of the Physical Society from 1874 to 1876; and was president of the Chemical Society from 1877 to 1879. A few years before his death he received the Davy medal from the Royal Society. He was one of the creators of that branch known as physical chemistry. Among his most important chemical works are that on the spectra obtained at varying hours during the day; his researches on the atomic refractions and dispersions of the elements; his investigations regarding voltaic batteries; the chemical history of gun-cotton; and archeological metallurgy. The Proceedings of the Royal Society contain more than 100 papers from his pen. He was for more than twenty years, beginning in 1873, a member of the London School Board. He was especially interested in a more general spread of scientific knowledge among the people, and he strove continuously to modify elementary public instruction to this end. The following paragraph appears in his presidential address before the chemical section of the British Association, delivered in 1872: "The so-called educated classes in England are not only supremely ignorant of science, but they have scarcely yet arrived at the first stage of improvement—the knowledge of their own ignorance."

Gossler, Gustav von, German statesman, born in Naumburg, April 13, 1838; died in Danzig, Sept. 29, 1902. He was the son of a Prussian judge, and studied law in Königsberg, Berlin, and Heidelberg, becoming a local magistrate in West Prussia in 1865 and legal assistant in the Ministry of the Interior to carry out district regulations in 1874. Four years of this work obtained for him the appointment of chief judge of the Administrative Court. A year later he became Under-Secretary in the Ministry of Worship, and was elected to preside over the newly elected Reichstag. On July 16, 1881, he succeeded Herr von Puttkamer in the Prussian Ministry of Worship, with the duty of giving practical effect to the reconciliation of the state and the Church. The repeal of the Falk laws was the most difficult part of his task. This he carried out without prejudice or partizanship in a way to win the confidence of both parties in the bitter controversy. He performed important services in developing higher education along modern lines and promoting scientific investigation. He framed the law

of elementary education. When the vivisection question was raised in the Prussian Chamber in 1883 he took a stand for the freedom of scientific investigation. On March 12, 1891, the minister was defeated on the question of an unimportant remnant of the May laws which he wished to retain as a safeguard for the state control of primary instruction. On June 7, 1891, he was appointed presiding justice of the provincial court of West Prussia.

Grant, George Monro, Canadian educator, born in Nova Scotia, in 1835; died in Kingston, May 10, 1902. He went from school in Nova Scotia to the University of Glasgow in 1853 and won the highest honors in classics, chemistry, and moral philosophy. On his return he engaged in missionary work. At the time that Canada was confederated, in 1867, while he was minister of a large and important congregation, he threw all his influence in favor of federal union and turned the scale in Nova Scotia. When the engineers made their preliminary survey of the Pacific Railroad route he accompanied Sir Sandford Fleming in the journey to British Columbia, and when he returned he published *From Ocean to Ocean*, a book that everybody read, describing the immense productive resources of the Canadian northwest. Nothing had so great an influence in winning wavering and uncertain minds to the idea of federation, which was then on its trial. The statesmen made much of the author and consulted him on public questions. He became in 1877 the principal of Queen's University, Kingston, which expanded under his management from a small denominational college into an important educational center. He wrote and spoke frequently on imperial unity, on the affairs of the Presbyterian Church, and on educational subjects.

Groome, Francis Hinde, English author, born in Monk Soham, Suffolk, England, Aug. 3, 1851; died in January, 1902. He was educated at Oxford, and in 1876 took up literary work in Edinburgh, which was his home thenceforth. He was joint-editor of Chambers's Biographical Dictionary, contributed to the Dictionary of National Biography, as well as to other literary enterprises, and wrote *In Gipsy Tents* (1880); *A Short Border History* (1887); *Two Suffolk Friends*; *Kriegspiel*, a novel (1896); and *Gipsy Folk Tales* (1899).

Hall, Christopher Newman, English clergyman, born in Maidstone, Kent, England, May 22, 1816; died in London, Feb. 18, 1902. He was educated at Highbury College and the University of London. Entering the Congregational ministry, he was pastor of the Albion Congregational Chapel at Hull in 1842-'54. In the latter year he was called to the Surrey Chapel, Blackfriars Road, London, the congregation of which subsequently erected an ornate church in Westminster Bridge Road. From 1893 he was pastor emeritus of this church. He was widely popular as a preacher, and in the course of three visits to the United States had become well known in the United States also. During the American civil war he was active in his efforts to create an English sentiment favorable to the cause of the Union, delivering lectures in many English towns regarding the nature of the struggle and the real issues at stake. His eloquence and his enthusiasm were of great service in this matter, and gained him many friends in the United States. He invariably had the courage of his opinions, and in consequence he opposed the agitation that followed the first appointment of Roman Catholic bishops to sees in England. He was a firm believer in total abstinence, and supported the temperance movement

heartily. As a preacher he was forceful and exceedingly fluent, his theology being dogmatic and evangelical. While he was still a minister at Hull he published a tract in 1846 entitled *Come to Jesus*, which proved extraordinarily popular, being translated into 40 languages and reaching a circulation of 4,000,000 copies. His other works include *The Scriptural Claims of Teetotalism* (1846); *Follow Jesus* (1848); *It is I* (1849); *Divine Socialism* (1851); *The Land of the Forum and the Vatican* (1854); *Seventy Scripture Chants* (1854); *Congregationalism for Christ* (1855); *Hymns and Songs for Bands of Hope* (1855); *Sacrifice* (1856); *Christian Victory* (1856); *The Dignity of Labor* (1856); *The Dangers of Negative Theology* (1857); *Hymns composed at Bolton Abbey, and Other Rhymes* (1857); *Hints on Preaching* (1858); *Now! (1858); Quench not the Spirit* (1858); *The Day of Salvation and Other Tracts* (1859); *Christ for Every One* (1860); *Plain Truths Plainly Put* (1861); *The Holy Catholic Faith* (1862); *The Shadow of the Almighty* (1862); *Watch and Pray* (1863); *Sermons preached in America* (1864); *Summer Rambles under the Shadow of the Matterhorn* (1865); *The Assassination of Lincoln: A Lecture* (1865); *The Cardinal and the Encyclical: A Lecture* (1865); *The Antidote of Fear* (1866); *Homeward Bound and Other Sermons* (1869); *Pilgrim Songs in Cloud and Sunshine* (1870); *Liverpool to St. Louis* (1870); *Conflict and Victory: An Autobiography* (1874); *Prayer* (1875); *The Lord's Prayer, a Practical Meditation* (1883); *The Coming of the Lord* (1884); *The Songs of Heaven and Earth* (1885); *Gethsemane; The Atonement; Lyrics of a Long Life* (1891); *Songs of the Divine Life* (1895); and *Autobiography* (1898).

Hamoud bin Mohammed bin Said, Sultan of Zanzibar, born in 1853; died July 23, 1902. He was a nephew of the Sultans Ali, Khalifa, and Burghash, and cousin of Sultan Hamed bin Thwain, who died suddenly on Aug. 27, 1896, probably of poison. The next heir to the throne, who was unfriendly to the English, seized the Government, but the British naval force interfered and placed Hamoud on the throne, depriving him of the share in the public administration exercised by his predecessor.

Hauser, W., Swiss statesman, born in 1837; died in Zurich, Oct. 22, 1902. He has been Minister of Finance in the Federal Government almost uninterruptedly since 1888, and at the time of his sudden death was completing the budget, having elaborated a tariff law. He was a tanner in early life, and when he entered upon his official life he devoted immense energy to public affairs and was a faithful guardian of the treasury. In 1890 he was President of the Confederation.

Hector, Mrs. Annie (French), "Mrs. Alexander," English novelist, born in Dublin, Ireland, in 1825; died in London, July 10, 1902. She began early to write, but discontinued the practise on her marriage to Alexander Hector, a Scotsman, who accompanied Layard in his explorations at Nineveh. After her husband's death she resumed her pen, and for nearly thirty years was one of the most industrious novelists of her day. She did not possess much originality, but she wrote with ease and fluency, and always entertainingly, and she retained through life a circle of readers who awaited her successive stories with interest. *The Wooing O't* first brought her into general notice, and it remains one of her best books. The tone of all her writing was wholesome, and if she made no striking contribution to literature, she succeeded in giving a great deal of genuine pleasure to very many persons. A nearly complete list

of her books, which are fiction with but few exceptions, includes *Which Shall it Be?* (1866); *Heroes of the Crusades* (1868); *The Legend of the Golden Prayer (verse)* (1872); *The Wooing O't* (1873); *Ralph Wilton's Weird* (1875); *Her Dearest Foe* (1876); *The Heritage of Langdale* (1877); *Maid, Wife, or Widow* (1879); *Moral Songs* (1879); *The Freres* (1882); *Look before you Leap* (new ed., 1882); *The Admiral's Ward* (1883); *The Executor* (1883); *Holiday Songs* (1884); *A Second Life* (1885); *At Bay* (1885); *Valerie's Fate* (1885); *Beaton's Bargain* (1886); *By Woman's Wit* (1886); *Mona's Choice* (1887); *Forging the Fetters* (1887); *A Life Interest* (1888); *The Stepmother* (1889); *A False Scent* (1889); *Blind Fate* (1890); *A Woman's Heart* (1891); *Mammon* (1891); *Well Won* (1891); *The Snare of the Fowler* (1892); *For his Sake* (1892); *Found Wanting* (1893); *A Ward in Chancery* (1894); *A Choice of Evils* (1894); *Broken Links* (1894); *What Gold can not Buy* (1895); *A Winning Hazard* (1896); *A Fight with Fate* (1896); *A Golden Autumn* (1896); *A Crooked Path* (1896); *Miss Crichton's Creditor* (1897); *Barbara: Lady's Maid and Peeress* (1897); *The Cost of her Pride* (1899); *V. C. Brown* (1899); *A Missing Hero* (1900); *Stronger than Love* (1902); *Mrs. Vereker's Courier Maid*; and *the Yellow Fiend*.

Heinrich XXII, Prince of Reuss-Greiz, born in Greiz, March 28, 1846; died there, April 19, 1902. All the princes of the house of Reuss have for nearly eight hundred years borne the name of Heinrich and are distinguished by numbers, which in the elder line begin anew with each hundred and in the younger line after the end of each century. This prince, belonging to the elder line, who was left to rule over one of the most insignificant dominions in Germany, was most jealous of his rights and dignity as a German sovereign, and distinguished himself by the indiscriminate opposition to Prussian policy that his Government invariably offered in the Federal Council. His mother, Princess Caroline, of the house of Hesse-Homburg, acting as regent, had taken the side of Austria in the war of 1866, following Saxony, Hesse, and Hanover, and in consequence Prussian troops occupied the principality and a war indemnity was levied. When Heinrich XXII reached his majority he began his reign by proclaiming representative government of a very restricted kind. With a newspaper for which he wrote and by means of his official and ecclesiastical patronage he endeavored to convert all his subjects to the separatist Guelph party. The militia corps under his orders were not allowed to raise flags or fire salutes for the Emperor. As a German sovereign he would observe treaties, but he would not hoist flags at the command of any prince.

Henty, George Alfred, English author, born in Trumpington, England, Dec. 8, 1832; died in Weymouth, England, Nov. 16, 1902. He was educated at Westminster School and at Cambridge, and went to the Crimea in the purveyor's department. He returned to England at the close of the war, and was successively placed in charge of the Belfast and Portsmouth districts as purveyor. Resigning his commission, he spent some years in mining operations in Wales and Italy, and later became special correspondent of the *London Standard*, in which capacity he went through the Austro-Italian, the Franco-Prussian, and Turco-Servian campaigns, and accompanied the Abyssinian and Ashantee expeditions, and was with Garibaldi in the Tyrol. For many years he edited the *Union Jack*, a popular periodical for boys. He spent, in his later years, six months of every twelve on board his yacht, and his death occurred

there while it was in Weymouth harbor. He was tall and burly in appearance, rather rigid in expression, and dogmatic in manner. His stories for boys are a blend of fact and extravagance, and constitute apparently a history of all the wars, great and small, in which England has been engaged for the past two centuries; but they are more picturesque than accurate. His books were poured forth with astonishing rapidity for an entire generation.

Herbert, William Kirk, Irish Anglican clergyman, died in County Louth, Ireland, Aug. 24, 1902. After studying for the Anglican ministry he was admitted to the priesthood in 1862. He was rector of Kilkenny, Ireland, from 1893 until his death, and was the author of an interesting work on *The Medical Language of Saint Luke* (1883).

Hertslet, Sir Edward, English diplomatist, born in London in 1824; died in Richmond, Aug. 4, 1902. He entered the Foreign Office, where his father, Lewis Hertslet, was librarian and archivist, in 1840, and succeeded his father in 1857. In 1878 he was attached to the mission of Lord Beaconsfield and Lord Salisbury at the Congress of Berlin, and was knighted for his services. He was one of the British delegates in 1889 for the settlement of the boundary between British and Dutch Borneo. He published *The Map of Europe by Treaty*; *The Map of Africa by Treaty*; *Recollections of the Old Foreign Office*; and collections of British commercial treaties with Austria, Turkey, Italy, Spain, Persia, Japan, and China; and he edited Hertslet's *Commercial Treaties and British and Foreign State Papers*, works begun by his father.

Heygate, William Edward, English clergyman, born in 1816; died Dec. 12, 1902. He was educated at Oxford, and after preparing for the Anglican ministry was admitted to the priesthood in 1840. After serving as curate at Great Wakering for some years, he removed to St. Gerrans in 1848, but returning to Essex was curate of Hadleigh, 1853-'57, and of Leigh, 1857-'69. In the last-named year he became rector of Brixton, Isle of Wight, a post which he filled for the rest of his life. From 1887 he was honorary canon of Winchester Cathedral. Canon Heygate was a moderate High Churchman, very active in all parochial duties, and a man of great personal charm. His varied writings comprise *Probatio Clerica* (1846); *The House of Spirits* (1846); *The Church of the Holy Trinity, Ely* (1848); *William Blake, or the English Farmer* (1848); *Godfrey Davenant at School* (1849); *Godfrey Davenant at College* (1850); *Ellen Meyrick, or False Excuses* (1851); *The Care of the Soul* (1851); *Pierre Poussin* (1851); *Speculation, a Tale* (1851); *Catholic Antidotes: Essays* (1858); *Sir Henry Appleton, or Essex during the Great Rebellion* (1858); *The Scholar and the Trooper* (1858); *The Evening of Life* (1860); *The Fugitive, and Other Poems* (1870); *Allegories and Tales* (1873); *Sudden Death, and Other Stories* (1880); *The Brothers, and Other Stories* (1880); *Old Richard, and Other Stories* (1881); *Parish Tales* (1883); and *An Old Parson's Anecdotes*.

Holub, Emil, Austrian explorer, born of Czech descent at Holics, Bohemia, Oct. 7, 1847; died in Vienna, Feb. 21, 1902. In early manhood he practised for a time as an apothecary, but at the age of twenty-five emigrated to South Africa, and practised in Kimberley and elsewhere as a physician, but without a doctor's degree. His love of natural history, and of ornithology in particular, presently led him to explore the region beyond the Zambesi, and his residence of seven

years in Africa was largely devoted to ornithological researches and to zoology in general. He lived for a time in Prague, but afterward settled in Vienna, where he married. He now resumed his medical studies and received his medical degree, and also devoted much time to the study of astronomy and geography. In 1883, accompanied by his wife, he made a second trip to South Africa, his task on this occasion having been made easier by a public subscription as well as a generous gift from the Emperor, Francis Joseph. He returned to Austria in 1887 and resided in Vienna thereafter, engaged in scientific work, and lecturing frequently upon South African affairs. In acknowledgment of his services as an explorer, he received from the Emperor the Order of the Iron Crown. Doctor Holub's published works comprise *Beiträge zur Ornithologie Sudafrika* (*Contributions to the Ornithology of South Africa*); *Sieben Jahre in Sudafrika* (1881); *The Colonization of Africa*; and *From Cape Town to the Country of the Maskukulumbé*.

Hooole, Charles Holland, English classical scholar, died in Richmond, England, at the age of sixty-six. He was educated at Oxford, and was ordained priest in 1863. He was lecturer at Christ Church College, Oxford, in 1862-'63, and tutor in 1863-'68, and from 1861 till his death was senior student of that institution. He was the author of *An Analytical Paraphrase of the Republic of Plato* (1861); *The Church and the Methodists* (1868); *The Shepherd of Hermas in English Verse, a translation* (1870); *The Apostolic Fathers* (1872); *St. Peter's Visit to Rome* (1873); *Poems and Translations* (1875); *Hermione, a Tragedy (verse)* (1877); *The Return of Ulysses, a Tragedy (verse)* (1880); and *The Classical Element in the New Testament considered as a Proof of its Genuineness* (1880).

Horanszky, Ferdinand, Hungarian statesman, born in 1838; died April 19, 1902. When the National party formed the Moderate Opposition he was its president for many years. When it was fused by Szell with the Government majority he was taken into the Cabinet as Minister of Commerce, but in a few weeks he died.

Hörup, V. L. B., Danish statesman, born in 1841; died in Copenhagen, Feb. 15, 1902. He was the editor of the Radical paper *Politiken*, which for twenty-five years combated the Conservative party until at last it gave up the reins of power. When a Radical Cabinet was constituted on July 24, 1901, he was included as the representative of the extreme wing, receiving the portfolio of Public Works. His health was so broken, however, that he was unable to take much part in public business.

Hughes, Hugh Price, English Wesleyan clergyman, born in Caermarthen, Wales, in 1847; died in London, Nov. 17, 1902. After studying at University College, London, he prepared for the ministry in the Wesleyan Theological College at Richmond. His first appointment was at Dover, where he remained three years, subsequently filling pastorates of equal duration at Brighton; Stoke Newington, London; Moslyn Road, London; Oxford; and Brixton Hill. At the close of his ministry at Brixton he was made superintendent of the West London Mission, which sustains the Lincoln House for Social Philanthropy in Soho Square and Katherine House Residence for Fallen Women in Montague Street, Russell Square. He was an eloquent preacher, and active in religious or semireligious undertakings for the past twenty years, being especially prominent in opposition to gambling, state regulation of vice, sweatshops, sacerdotalism, and vivisection. At the

time of his death he was president of the London Methodist Council. He vigorously and successfully opposed the proposal to admit Unitarians to the National Council of Evangelical Free Churches, and combated with equal vehemence the exclusion of religious teaching from the board schools. At the Review of Churches Conference at Grindelwald, Switzerland, in 1894, he spoke on the possible reconciliation between English Dissenters and the Church of England, and was also present at the Lucerne Conference the previous year. He was editor of the *Methodist Times*, and he published *Social Christianity* (1889); *Essential Christianity*; *Ethical Christianity*; *The Philanthropy of God* (1890); and *The Atheist Shoemaker* (1891).

Hughes, Richard, English homeopathist, born in London in 1826; died in April, 1902. He became a member of the Royal College of Surgeons in 1857. He published *Pharmacodynamics* (1867); *A Manual of Therapeutics*; *Hahnemann as a Medical Philosopher*; and *The Cyclopædia of Drug Pathology*.

Johnson, Lionel Pigot, English poet, born of Irish parentage, at Broadstairs, Kent, England, March, 1867; died in London, Oct. 4, 1902. He was educated at Winchester College and at Oxford. He was a staunch Roman Catholic, and the influence of his mother Church is frequently apparent, and equally evident is his strong Celtic spirit. He did much in the field of literary criticism, and to the general reader was perhaps better known as a scholarly critic than as a poet, through his contributions to critical periodicals. His work in both directions exhibited much promise, with not a little in the way of fulfilment. His published books include *The Art of Thomas Hardy* (1894); *Poems* (1896); and *Ireland, with Other Poems* (1897).

Kent, William Charles Mark, English author, born in London, Nov. 3, 1823; died there, Feb. 23, 1902. He was of Roman Catholic parentage, and received his education at Oscutt College. He edited *The Sun* in 1845-'70, and the *Weekly Register* in 1874-'81. He also studied law, and was called to the bar of the Middle Temple in 1859. He was a frequent contributor to works of reference, including the *Dictionary of National Biography* and the *Encyclopedia Britannica*, and was the author of the following works: *Catholicity in the Middle Ages* (1847); *The Vision of Cagliostro* (1847); *Alethia, or the Doom of Mythology, with Other Poems*, much praised by Lamartine (1850); *What shall be done with Cardinal Newman?* (1850); *The Derby Ministry* (1858); *The Lives of Eminent Conservative Statesmen* (1866); *The Dickens Dinner* (1867); *The Gladstone Government* (1869); *Poems* (1870); *Mythological Dictionary* (1870); *Charles Dickens as a Reader* (1872); *Corona Catholica ad Petri Successoris Oblata* (1880); and *The Modern Seven Wonders of the World* (1890). Several of his books appeared under the pseudonym of Mark Rochester. He edited the miscellaneous writings of the first Lord Lytton, and also the writings of Father Prout, Burns, and his intimate friend Leigh Hunt.

Kimberley, John Wodehouse, Earl of, British statesman, born Jan. 7, 1826; died in London, April 8, 1902. He was a son of Henry, son of the second Baron Wodehouse, was educated at Christ Church, Oxford, taking a first class in humane letters in 1847, married the daughter of the Earl of Clare, took his seat in the House of Lords, having succeeded his grandfather in 1846, and was appointed Under-Secretary of State for Foreign Affairs in 1852 by Lord Aberdeen, holding

the same post under Lord Palmerston during the Crimean War. In 1863 Lord Wodehouse was despatched by Lord John Russell to Copenhagen to straighten out the Schleswig-Holstein imbroglio, with instructions to uphold the London protocol of 1850, recognizing the unity of Denmark, Schleswig-Holstein, and Lauenburg, and the treaty of 1852, securing the succession of Prince Christian of Glücksburg, without committing England, although Denmark had violated engagements which Germany considered a part of the treaty. Germany and Austria had therefore threatened to annul it and seize the duchies, but were willing

to accept the compromise proposed by England as mediator, and Denmark, relying on the armed intervention of England, had rejected this compromise. The succession of Prince Christian to the Danish throne had brought matters to a focus. The treaty could not be carried out because its terms were contradictory, the duchies being declared to be an integral part of Denmark, and yet the rights of the German Federation over them were reserved. In the confusion the Prince of Augustenburg revived his claim to the throne of Holstein, and the German people were wrought up over the wrongs of their kinsfolk in the duchies, while the Danes grew frantic at the thought of their kinsfolk and a part of their national territory being swallowed up in Germany. It was a question that England could solve only by an arbitrary decision, with the will to back it up by force. His Government supported the Danish contention, but was unwilling to act, and therefore Lord Wodehouse failed. After his return he was appointed Secretary of State for India, but before he could decide with Sir John Lawrence, the new Governor-General, on the course to be followed in regard to the war in Bhutan and the struggles of Shere Ali, England's *protégé*, for the Afghan throne, he was transferred toward the end of 1864 to the post of Viceroy of Ireland, which he filled for nearly two years, where he made no mark, but on the strength of his arresting the early Fenians and in keeping with his official advancement was raised in the peerage to be Earl of Kimberley. The Liberal ministry of Earl Russell was succeeded by that of the Earl of Derby in July, 1866. When Mr. Gladstone formed a Cabinet in December, 1868, he made Lord Kimberley Lord Privy Seal. This office was exchanged in 1870 for that of Secretary of State for the Colonies. Diamonds were discovered in South Africa just then. When a mining-camp sprang up on the spot it took the name of the Colonial Secretary, under whose administration it was discovered that, instead of belonging to the Orange State farmers who had settled there, it belonged to half-breed savages living elsewhere, and was therefore British territory. During his first tenure of the office Rupertsland was created into the Canadian province of Manitoba in 1870, the Dominion was empowered to organize new provinces in 1871 and the last British garrison was withdrawn, Cape Colony received responsible gov-

ernment, and the Australian colonies were rebuked and were restrained from making protective tariffs to suit themselves and were invited to establish intercolonial free trade. In 1874 Mr. Disraeli returned to power, and it was six years before Mr. Gladstone came in again. Lord Kimberley took charge of the administration of the colonies once more. He had to contend with serious difficulties in South Africa. The attempt to disarm the Basutos had failed, and the Cape Colonists and the home Government were both at a loss to know what to do, and each blamed the other. Then the Transvaalers called upon Mr. Gladstone to grant them the independence he had inveighed against the Tories for not granting, and when he refused they drove the British garrisons out of the country, defeated the forces sent to chastise them, and won their independence with their rifles, qualified only by a meaningless suzerainty. Lord Kimberley explained that the Transvaal had been annexed on the supposition that the inhabitants desired British administration, which they had now demonstrated that they did not desire, and hence annexation was not justifiable; but why it was necessary for such a demonstration that the British army must stomach a defeat without a chance to redeem its honor he could not explain to the army and its friends. He became provisionally chancellor of the Duchy of Lancaster when Mr. Bright retired, and in December, 1882, he left the Colonial Office to become Secretary of State for India. He found the difficulties of this office as trying as those in the Colonial Department. The policy of retirement from Afghanistan was denounced by the Conservatives as hotly as withdrawal from the Transvaal. Lord Ripon's promises of representative institutions for India caused such consternation in Indian officialdom that the Liberals had doubts about the security of British rule in India. He restrained the impulses of Lord Ripon and effectively checked the Radical movement in England in favor of large measures of self-government for India, while he approved the extension of education and of local representation. When a Russian war scare arose he assumed a defiant attitude and returned to a forward policy. Retiring with the ministry in June, 1885, he returned to the India Office in February, 1886, till Mr. Gladstone was defeated on home rule, and went out in August of that year. In the Gladstone Cabinet, formed in August, 1892, Lord Kimberley, who had become leader of the Liberal party in the House of Lords, was Lord President of the Council as well as Secretary for India. Although as an orthodox economist he condemned all proposals to stay the falling rupee by legislation, he yielded finally to the importunity of the Indian Government after it had wrung half-hearted approval from Lord Herschell's committee and consented to the closing of the mints and the temporary restriction of the sale of Council bills. Soon afterward, when Lord Rosebery became the head of the Cabinet, he took the latter's place at the Foreign Office, though Lord Rosebery did not relinquish his authority to speak in foreign affairs until he laid down the leadership of the party in 1896. A lease from the Congo State of a route for the Cape to Cairo railroad had to be given up when Germany objected because it was contrary to treaty. When Russia, France, and Germany prohibited Japan from retaining territory in Manchuria after her victory over China, England stood helplessly by, unwilling either to join them or to efficiently support Japan in resisting their dictation. Since June, 1895, Lord Kimberley has been the authoritative spokesman of the Opposition on foreign affairs,

and during the Boer War, although he had strong motives for vindicating his own policy in South Africa and also in the Soudan and in China, he was careful to say nothing tending to embarrass the action of the Government. Lord Kimberley was much interested in education. He was a member of the senate of the University of London, succeeding Lord Herschell in 1899 as chancellor, and was president of University College.

Kowalevsky, Alexander, Russian biologist and anatomist, born near Witebsk, in northwest Russia, Nov. 10, 1840; died Nov. 22, 1902. His father was a Pole, and his mother a Russian. He received his early education at home, and was then placed in the Engineering School of Roads and Highways, in St. Petersburg. But he preferred the study of science to a practical career. As a result of the student disturbances of 1861 he was obliged to leave the country. He went to Heidelberg, where he studied chemistry under Bunsen. He soon developed a taste for zoology and comparative anatomy, and pursued these subjects under Brün, and Pagenstecher, and later under Leydig at Tübingen. In 1864 he published in Russian his first zoological work, *The Anatomy of Idothea*. He went in 1864 to Naples, and carried out important researches on the embryology of low marine forms of life, and in 1866 he made researches on the ascidia. The results of this work, which led to the recognition of the ascidians as vertebrata, gave a new impulse and direction to embryological research. After being for a time *privat docent* at the University of St. Petersburg, he was appointed professor extraordinarius at Kazan in 1868, and professor ordinarius at Kiev in 1869, and at Odessa in 1874, where he remained until 1890. He was made a titular member of the Academy of Sciences of St. Petersburg in the latter year. He was for many years director of the biological laboratory at Sebastopol, and did much of his work there.

Kraus, Franz Xavier, German historian, born in 1841; died Jan. 1, 1902. He was educated for the priesthood and became a disciple of Dr. Döllinger, but did not join his Old Catholic schism. He made researches in ecclesiastical archeology and published valuable treatises on the origin and development of Christian art and early Church history. He was Professor of Ecclesiastical History in the University of Freiburg. In 1896 he published a standard work on the History of Christian Art.

Krupp, Friedrich Alfred, German industrialist, born in Essen; died there, Nov. 22, 1902. His grandfather, Friedrich, spent his life and his fortune in trying to perfect a new process of steel-making. His father, Alfred, invented a new method of manufacturing spoons, new machinery and dies for coining money, a new Bessemer steel out of which he made rifles and cannons, a breech-block for artillery, a seamless tire for car-wheels, a method of hardening armor-plate, and many new uses for steel. He built up at Essen the greatest iron-works in the world, furnishing the German Government and many others with rifle barrels and field and naval guns of Bessemer steel and with ship armor, and all countries with railroad materials. Friedrich Alfred succeeded to the ownership and management of the plant on the death of his father, in 1887. He took in other steel-works at Rheinhausen and near Magdeburg, acquired four coal-mines in different parts of Germany, iron-mines in Spain containing ore for mixing so as to produce the best Bessemer steel, and German iron-mines, and amalgamated with the concern a great ship- and engine-building company with works at Kiel and Berlin. He had a fleet of steamers for exporting his goods. His

capital, including his share in other enterprises, at the time of his death was estimated at 500,000,000 marks, his income at 20,000,000 to 40,000,000 marks. The policy of his father toward his workmen was to furnish them with sanitary dwellings, medical attendance, and means of education and recreation, and insurance, keeping them out of the labor-unions, benefit associations, and political organizations. This patriarchal system was greatly extended and developed by the son, who provided model homes at the lowest rental for the families of his 43,000 workmen, with hospitals, schools, and casinos, organized for them

a system of cooperative stores, and gave them retiring pensions on more favorable terms than the Government or the mutual insurance societies. He was simple and retiring in his habits, but his society and advice were valued by the present German Emperor, who would have liked to give him a title of nobility. He spent his winters at Capri and carried on investigations of the marine fauna of the Mediterranean, of which he collected preserved specimens, and he had an immense aquarium for studying aquatic life and left materials for a book on the subject. The Socialist press of Germany constantly attacked Herr Krupp, and his death is supposed to have been hastened by a slanderous, degrading charge against his private character made in the chief organ of the Social-Democratic party, the *Vorwärts* of Berlin.

Lago, Carlo, Italian impresario, born in Italy in 1830; died in Milan, in March, 1902. He had been connected with the production of grand opera in all parts of the world, and was manager of the Italian Opera in St. Petersburg for several years. He also gave several seasons of opera at Drury Lane Theater, London. He first visited this country as musical conductor with Adelina Patti, when she was under the management of Henry E. Abbey and Maurice Grau; and in 1901 he traveled in the United States as conductor of Mme. Sembrich's concert company. He was one of the best known of the old school of Italian opera impresarios, and was familiar with every detail of the production of an opera, from conducting the orchestra to training the chorus.

Landesman, Heinrich, "Hieronymus Lorm," an Austrian poet, born in Nikolsdorf, Moravia, Aug. 9, 1821; died in Brunn, Moravia, Dec. 3, 1902. He lost his hearing at the age of fifteen, and his sight failed not long afterward, but he invented a kind of finger language, which enabled him to communicate his wants and to dictate his poems and other works. His poetry is markedly pessimistic. His writings include *Abdul* (1843); *Wiens poetische Schwingen und Federn* (1846); *Erzählung des Jahres* (1848 (1855)); *Am Kanin* (1856); *Erzählungen des Heimgekehrten* (1858); *Intimes Leben* (1860); *Philosophisch-kritische Streifzüge* (1873); *Geflügelte Stunden* (1875-78); *Tote Schuld* (1878); *Späte Vergeltung* (1879); *Der Abend zu Hause* (1881); *Ein Schatten aus vergangenen Tagen* (1882); *Vor dem Attentat* (1884); and *Die Schöne Wienerin* (1886).

Latey, John, English novelist, born in London, Oct. 30, 1842; died Sept. 26, 1902. He was the son of John Lash Latey, a former proprietor of the *London Illustrated News*, and after being educated at Barnstable, was for forty years connected with the *Penny Illustrated Paper*, which he edited almost from its beginning in 1861. For a long period he contributed the parliamentary sketches that appeared in the *Illustrated News* under the signature of "The Silent Member," and in 1899 he became editor of *The Sketch*. Mr. Latey was the author of a translation of Alexandre Dumas's *Mohicans of Paris* (1875), and of Paul Feval's *Fils du Diable*, to which he gave the English title of *The Three Red Knights*. In original work he produced the comedietta *The Rose of Hastings*; *The Life of General Gordon*; *The Showman's Panorama* (with W. Mackay) (1890); and the novels *Love Clouds* (1884); *The River of Life* (1886); *A Daughter of the People*; *A London Prima Donna*; *The Queen of Hearts Mine*; *Diamonds Led*; and *Hearts were Trumps*.

Latham, Henry, English clergyman, born in Dover, England, June 4, 1821; died June 5, 1902. He was educated at Cambridge, and entered the Anglican ministry as priest in 1850. His life was spent almost entirely in Cambridge, where he became tutor in Trinity Hall, and fellow of the same institution. He was vice-master of the hall from 1850 to 1888, and was master from the last-named year until his death. He published *Geometrical Problems in the Properties of the Conic Sections* (1848); *On the Recommendations of the University Commission* (1857); *On the Action of Examinations* (1877); *Pastor Pastorum, or the Schooling of the Apostles by Our Lord* (1890); *A Service of Angels* (1894); and *The Risen Master* (1901).

Laurie, Mrs. J. Warner, English author, died in Cannes, France, in December, 1902. She was the wife of an Edinburgh educational publisher, and some of her books attained a wide popularity, their circulation reaching into the hundreds of thousands. They include Henry's *History of England* (1868); *Dramas for Children* (1869); *Henry's Scripture Lessons* (1869); *Maxwell's Geographies* (1869); *The Queen of the Mice*; *Tales and Adventures for the Young*; and *A Trip Round the World*. She edited, also, a popular anthology entitled *Playtime with the Poets*.

Leake, George, Australian statesman, born in 1868; died in Perth, June 24, 1902. He belonged to a family that played a prominent part in the political life of Western Australia, and a year after his admission to the bar in 1890 he became Acting Crown Solicitor. He rose to be Acting Attorney-General and a member of the Executive Council in 1896. In 1899 he was elected to the first Legislative Assembly of the colony, from which he resigned so as to retain the post of Crown Solicitor. In May, 1901, he formed a ministry; when it was reconstructed he became Attorney-General as well as Premier, and he died while in office.

Lecky, Squire Thornton Strafford, English ship captain, who died at Las Palmas, Canary Islands, Nov. 23, 1902. He had made running surveys of Patagonia, and for personal services to the King of Portugal had received the Holy and Military Order of Jesus Christ. He was a fellow of the Royal Astronomical Society and of the Royal Geographical Society. For some years he served as captain in the Inman Line of steamships, and later in the Pacific Steam Navigation Company. Capt. Lecky published *Wrinkles in Practical Navigation*, a much valued work (1881); *The Danger Angle and Off-*

shore Distance Tables (1882); and General Utility Tables (1897).

Ledochowski, Miescelaus, Polish ecclesiastic, born in Klimonton, in 1822; died in Rome, July 22, 1902. The seat of the Counts Ledochowski, near Sandomir, was in Russian territory that was afterward ceded to Germany. Count Miescelaus, a younger son, was educated at the Jesuit Nobles' College in Rome, and after being admitted to priest's orders in 1845 he entered the diplomatic service of the Vatican and was employed till 1861 in missions to Lisbon, South America, and Brussels. In 1865 he was elected Archbishop of Posen by the cathedral chapter. He discouraged the Polish agitation and sustained the Prussian Government in its policy, and as *persona grata* at Berlin he was selected by Cardinal Antonelli in 1870 to solicit the support of Prussia for the temporal power of the papacy. He negotiated with Prince Bismarck at Versailles with no success, and henceforth he adopted a hostile attitude with the object of bringing the Prussian Government to terms, taking the lead in the ultramontane opposition and championing the national aspirations of the Poles. The conflict on education between the Clericals, led by Dr. Windhorst and inspired by Archbishop Ledochowski, and the Prussian Government the latter brought to an issue by the May laws of 1873, requiring every candidate for holy orders to show a certificate of educational qualifications from the state, placing seminaries and monastic institutions under state supervision, and ordering the ecclesiastical authorities to submit all appointments and transfers for the approval of state officials. The Archbishop of Posen defied these laws. He was fined for appointing and transferring parish priests and for other infractions of the new laws until all his property was distrained and finally he was condemned to imprisonment for two years in the fortress at Ostrovo and his archbishopric was declared vacant by the Prussian ecclesiastical court. Pope Pius IX refused to recognize his deposition, made him a cardinal in 1875, and after his release in 1876 received him as a guest at the Vatican. Pope Leo XIII made him Prefect-General of the *Congregatio de Propaganda Fide*. During the *Culturkampf* the German Government perceived in many ways the untoward consequences of Cardinal Ledochowski's hostility. The end of the long conflict was signalized by the reference of the dispute with Spain in regard to the Caroline Islands to the arbitration of the Pope, and from that time the diplomacy of the Vatican was favorable to German interests. Whatever success the German Emperor and his Government has attained in the effort to supplant the claim of France to protect Catholic missions and Christians in the near and far East has been attributed to the pro-German sympathies of the Red Pope.

Lee, Frederick George, English clergyman, born in Thame, Oxfordshire, England, Jan. 6, 1832; died in England, Jan. 23, 1902. He was educated at Oxford, and was admitted to the priesthood in 1856. From 1877 to 1899 he was vicar of All Saints, Lambeth. He assisted in founding the Association for the Promotion of the Unity of the Church in 1857, and twenty years later he founded the Order of Corporate Reunion, and was in consequence severely criticized by the evangelical party for his supposed Romanizing tendencies. One of his sons entered the Roman Catholic communion, and at the close of 1901 the father also became a Roman Catholic. Both as clergyman and as author Dr. Lee was ever busy, and more than one hundred publications witness to the activity of his pen. The more im-

portant of these are *Lays of the Church*, and *Other Poems* (1851); *The Martyrs of Vienne and Lyons* (1854); *Poems* (1855); *Petronilla, and Other Poems* (1858); *Death, Judgment, Hell, and Heaven* (1858); *The Beauty of Holiness* (1859); *Words from the Cross* (1861); *Directorium Anglicanum* (2d ed., 1865); *Christopher Davenport; Articles of the Anglican Church Considered* (1865); *Morning and Evening Prayers for Children* (1866); *Sermons: Parochial and Occasional* (1868); *The Validity of the Orders of the Church of England Maintained and Vindicated* (1869); *The King's Highway, and Other Poems* (1871); *Abolition and Rejection of the Athanasian Creed* (1872); *The Bells of Botteville Tower, and Other Poems* (1873); *The Christian Doctrine of Prayer for the Departed* (1874); *Glimpses of the Supernatural* (1876); *Memorials of Rev. Robert Stephen Hawker, Vicar of Morwenstow* (1876); *A Glossary of Liturgical and Ecclesiastical Terms* (1876); *Historical Sketches of the Reformation* (1878); *More Glimpses of the World Unseen* (1878); *The Church under Queen Elizabeth* (1880); *Order out of Chaos* (1881); *Reginald Barentyne: A Tale of the Times* (1881); *History and Antiquities of the Church of Thame* (1883); *Glimpses in the Twilight* (1884); *King Edward the Sixth, Supreme Head* (1886); *Reginald Pole: An Historical Sketch* (1887); *Immodesty in Art* (1887); *The Church of Haddenham, Berkshire* (1888); *A Manual of Politics* (1889); and *Sights and Shadows, being Examples of the Supernatural* (1894).

Lidderdale, William, English merchant, born in St. Petersburg, in 1832; died in London, June 26, 1902. He was trained in the counting-house of a Liverpool firm doing business with Russia, where his father was established, and afterward was connected with a shipping firm, which he represented in New York from 1857 till 1863, and then as a partner opened a house in London. In 1870 he was chosen a director of the Bank of England, and in 1889 became governor. The reserve of cash was low and was being withdrawn to South America. There had been a period of buoyant confidence and speculation when early in November, 1890, the bank rate of discount was marked up to 6 per cent. without any known adequate reason, and it became known that the bank had borrowed £3,000,000 from the Bank of France and £1,500,000 from the Russian treasury. The cause became apparent when the failure was announced of Baring Brothers, who had locked up immense sums of English floating capital in Argentine public securities, railroads, and other enterprises that were for the moment unprofitable. The Bank of England and the bankers of London joined hands to enable the Baring firm to liquidate its affairs without sacrificing the interests of its clients, and to carry out the arrangements Mr. Lidderdale remained governor till 1892. He was influential in syndicates holding Chicago and Western and Mexican railroad stocks and in the Council of Foreign Bondholders.

Lieber, Ernst, German politician, born in Camberg, near Wiesbaden, Nov. 16, 1838; died there, March 31, 1902. He studied philosophy and law at Würzburg, Bonn, Munich, and Heidelberg, was elected to the Diet of Hesse-Nassau, took his seat in the Prussian House of Deputies in 1870, and on the establishment of the empire was elected in 1871 to the Reichstag, joined Dr. Windhorst, the former Hanoverian Minister of State, in forming a united and militant Roman Catholic party, took the lead himself of the Democratic Clericals, and therefore did not immediately succeed to the leadership of the whole party.

When Dr. Windhorst died, in 1891, and when Count von Ballestrem and Baron Hüne failed to induce the party to accept their compromise with Count Caprivi on the military bill of 1893, Dr. Lieber, who headed the uncompromising resistance to the increase in the army, assumed henceforth the leadership. He had not the authority and the influence over all sections that Dr. Windhorst wielded, but yet he was able to keep the Center together and maintain party discipline.

Liu-Kun-Yi, Chinese statesman, born in Hunan, about 1820; died in Nanking, Oct. 6, 1902. Coming from the province that furnishes the Chinese army with its best material, he was a soldier by education, and as such he made his way upward in the official hierarchy without literary attainments and speaking only the dialect of his province. In 1860, at the head of one of the armies raised to fight the Taiping rebels, he turned back the tide of revolt in Kiangsi by a series of successful operations. He was Viceroy of Nanking when the Boxer outbreak occurred in Shan-tung and Pechili, when antiforeign agitators raised the cry of China for the Chinese in the Yangtse valley, and when the Imperial Government called for troops to defend the capital against the invaders and ordered the expulsion of Europeans Liu-Kun-Yi, acting in concert with Wang-Chih-Tung, Viceroy of Wuchang, refused to join in the movement and used his authority and the foreign-drilled troops at his command to repress every demonstration against foreigners. The Yangtse viceroys kept the Boxer movement and the war confined to the northern provinces, and in the arrangement of peace and the negotiation of a new commercial treaty they were able to protect Chinese interests and facilitate a settlement.

Macaulay, James, Scottish novelist, born in Edinburgh, Scotland, May 22, 1817; died there, June 20, 1902. He was educated at the university of his native city, and was for thirty-five years editor in chief of the Religious Tract Society. He was joint editor of the *Literary Gazette* in 1851-'57, and in 1858 became editor of the *Leisure Hour Sunday at Home*. He founded the popular periodicals *The Boy's Own Paper* and *The Girl's Own Paper*. His published works comprise *Across the Ferry*; *First Impressions of America and its People* (1871); *Memory Helps in British History* (1873); *Ireland in 1872: A Tour of Observation* (1873); *A Plea for Mercy to Animals*, which attracted general attention (1875); *All True: Records of Adventure* (1879); *Gray Hawk: Life and Adventures among the Red Indians* (1883); *Luther Anecdotes* (1883); *True Tales of Travel and Adventure, Valor and Virtue* (1884); *Sea Pictures drawn with Pen and Pencil*, new edition (1884); *Stirring Stories of Peace and War by Land and Sea* (1885); *Gordon Anecdotes* (1885); *Livingstone Anecdotes* (1886); *Thrilling Tales of Enterprise and Peril, Adventure and Heroism* (1886); *Whitefield Anecdotes* (1886); *Wonderful Stories of Daring, Peril and Adventure* (1887); *Victoria, her Life and Reign* (1887); and *From Middy to Admiral of the Fleet*.

MacEvilly, John, Irish Roman Catholic prelate, born in Louisburgh, County Mayo, Ireland, in April, 1817; died in Tuam, Ireland, Nov. 26, 1902. His education was received at Maynooth College, and he was ordained priest in 1840. In 1842 he was appointed Professor of Scripture in Saint Jarlath's College, Tuam, and subsequently he was president of that institution several years. He was appointed Bishop of Galway in 1857, and in 1866 Apostolical Administrator of Kilmacduagh and Kilnefora, continuing, however, as Bishop of

Galway. Appointed bishop-coadjutor of the archbishopric of Tuam in 1878, he succeeded Archbishop McHale as Archbishop of Tuam in 1881. He was the author of an English Commentary on all the New Testament except the Apocalypse.

MacGibbon, David, Scottish architect, born in Edinburgh, Scotland, in 1831; died there, Feb. 23, 1902. He received his education at Edinburgh University, and prepared for his profession in his native city and in London, spending much time also in architectural investigations in Italy, France, and Spain. With Thomas Ross he entered upon the practise of architecture in Edinburgh, and the firm executed many important works in that city and its vicinity. Shortly before his death the firm had undertaken the restoration of Iona Cathedral. In 1888 Mr. MacGibbon published a readable volume on *The Architecture of Provence and the Riviera*, and with Mr. Ross he was author of *The Castellated and Domestic Architecture of Scotland from the Twelfth to the Eighteenth Century*, a work of great value (1886-'92); *The Ecclesiastical Architecture of Scotland from the Earliest Christian Times to the Seventeenth Century* (1896); and *The Five Great Churches of Galloway* (1899).

Mackay, Alexander, Scottish educational writer, born in Bonar Bridge, Sutherlandshire, Scotland, in 1833; died in Edinburgh, Dec. 4, 1902. He was educated at the University of St. Andrews, and was a member of the Edinburgh School Board from 1897, and editor of the *Educational News*. His published works include *A Manual of Modern Geography* (1861); *Outlines of Modern Geography* (1865); *Facts and Dates* (1869); *First Steps in Geography* (1869); *Physical Geography* (1869); *Routing Geography* (1874); *Intermediate Geography* (1874); *Foreign Systems of Education*; *Esthetics in Schools*; *A History of Scotland*; *A Plea for Our Private Schools*; and *Free Trade in Teaching*.

Maclear, George Frederick, English clergyman, born in Bedford, England, Feb. 3, 1833; died in Canterbury, Oct. 17, 1902. He was educated at Cambridge, distinguishing himself by excellence in theological studies and winning several prizes. He was ordered priest in the Established Church in 1857, and after some years passed as assistant minister in London churches was head master of King's College School from 1866 to 1880. He had in the interim been assistant preacher at the Temple in 1865-'70, examiner for the Lightfoot Scholarship at Cambridge in 1876-'77, and Boyle lecturer at Cambridge in 1880. From 1880 till his death he was warden of St. Augustine's College, Canterbury, and was made honorary canon of Canterbury Cathedral in 1885. Under his wardenship the college at Canterbury increased very greatly in efficiency, while his influence as a theological writer, particularly in the earlier portion of his career, was extensive, his *Old and New Testament handbooks* attaining a wonderful popularity and holding it for a long time. Canon Maclear's published writings include *Incentives to Virtue, Natural and Revealed* (1857); *The Cross and the Nation* (1857); *The Christian Statesman and Our Indian Empire* (1859); *Class Book of Old and New Testament History* (1861); *The Witness of the Eucharist* (1863); *A History of Missions during the Middle Ages* (1863); *A Shilling Book of New Testament History* (1867); *The Apostles of Medieval Europe* (1869); *The Hour of Sorrows* (1875); *The Conversion of the Celts, the English, the Northmen, and the Slavs* (1878-'79); *The Gradual Conversion of Europe* (1879); *Evidential Value of the Holy Eucharist* (1880); *Saint Augustine's, Canterbury: Its Rise, and Res-*

toration (1888); Introduction to the Creeds (1889); Introduction to the Articles (joint author) (1895). As editor Canon Maclear published The Gospel of Saint Mark, with Notes and Introduction (1877); and The Book of Joshua, with Notes and Introduction (1878).

Macleod, Henry Dunning, English barrister, born in 1821; died July 16, 1902. His education was obtained at Cambridge, and he was called to the bar of the Inner Temple in 1849. His published writings include *The Theory and Practice of Banking* (1855-'56); *Elements of Political Economy* (1858); *Dictionary of Political Economy* (1862); *Principles of Economical Philosophy* (1872); *The Elements of Banking* (1876); *Economics for Beginners* (1878); *The Elements of Economics* (1881-'86); *Institute of Bankers in Scotland* (1882); *The Theory of Credit* (1889); and *Bimetallism*.

Margareta Sophia, Duchess of Württemberg, born in 1870; died Aug. 24, 1902. She was an archduchess of Austria, niece of the Emperor Franz Joseph, being a daughter of the Archduke Karl Ludwig and the Princess Annunziata of the Two Sicilies. She was married to Duke Albrecht of Württemberg, son of Duke Philip, brother and heir presumptive of the King, in January, 1893, and bore him six children.

Marie Henrietta, Queen of the Belgians, born in Schönbrunn, Aug. 23, 1836; died in Spa, Sept. 17, 1902. She was an Austrian Archduchess, daughter of the Archduke Joseph, Palatine of Hungary, third son of the Emperor Leopold II, and married the Crown-Prince Leopold of Belgium when both were only seventeen years old. She had been Queen of the Belgians since 1865, but lived a secluded life, saddened by the death of her only son in 1869 and by the domestic misfortunes of her daughter Stephanie, but consoled by the presence of her youngest daughter, the Princess Clementine. She was a collector of laces and did much to revive the lace industry in Belgium, and for her charities was beloved by the Belgian people.

Martin, Arthur Patchett, English author, born in Woolwich, England, Feb. 18, 1851; died in Teneriffe, Canary Islands, Feb. 15, 1902. When a child he was taken by his parents to Melbourne, Australia, and his education was obtained at the Melbourne University. He entered the Victorian Civil Service in 1868, resigning in 1882. With others he founded the Melbourne Review in 1876, and was its editor till 1882. He then settled in London. His published books include *Lays of To-day, or Verses in Jest and Earnest* (1878); *Fernshawe: Sketches in Prose and Verse* (1881); *Australia and the Empire* (1889); *True Stories from Australian History* (1893); *Life and Letters of Robert Lowe, Viscount Sherbrooke* (1893); *The Withered Jester, and Other Verses* (1895); and *Beginners of Australian Literature* (1900).

Maurer, Konrad von, German archeologist and ethnologist, born in Frankenthal, April 29, 1823; died Sept. 18, 1902. He was an authority of the first rank on the early history and laws of the Teutonic and Scandinavian peoples. He published an important series of works on the constitution and history of Iceland. He was a good Scandinavian scholar, and edited the first edition of the *Gulthorissaga*. His works include *Die Bekehrung des Norwegischen Stammes zum Christentum*; *Island von seiner ersten Entdeckung bis zum Untergange des Freistaates*; *Das Alter des Groszsprecheramtes in Norwegen*; *Studien über das sogenannte Christenrecht König Sverrirs*; and *Das älteste Hofrecht des Nordens*. He also published a collection of Icelandic popular legends of the present day.

Meiklejohn, John Miller Dow, Scottish educator, born in Edinburgh, Scotland, July 30, 1830; died in Ashford, England, April 5, 1902. He received his education at the university in his native city, and from 1876 was Professor of Education in the University of Saint Andrews. Prof. Meiklejohn was a prolific author of text-books and other educational works, his writings comprising a translation from the German of Kant's *Critique of Pure Reason* (1852); *Geography: The Best and Worst Methods of Teaching It* (1869); *Book of the English Language* (1877); *History of the British Empire* (1878); *The Problem of Teaching to Read* (1879); *The New Education* (1881); *An Old Educational Reformer: Dr. Andrew Bell* (1881); *The English Language: Its Grammar, History, and Literature* (1886); *Outlines of the History of English Literature* (1886); *Short History of the English Language* (1886); *A New Grammar of the English Tongue* (1887); *A New Geography in the Comparative Method* (1889); *Outlines of the History of England and Great Britain* (1890); *The British Empire: Its Geography, Resources, Commerce, Landways, and Waterways* (1891).

Mello, Custodio José de, Brazilian naval officer, died March 16, 1902. He was admiral of the Brazilian fleet when Peixotto was President and attempted to overthrow the republic in 1892 in order to restore Dom Pedro as Emperor. With his ships he blockaded Rio de Janeiro and bombarded the city. Beaten in the end, he was arrested and condemned to imprisonment. As he attempted soon afterward to organize a new insurrection, he was banished from Rio.

Mesdag, Hendrik Willem, Dutch painter, born in Groningen, in 1831; died in The Hague, Aug. 4, 1902. He was the son of a banker and began life in the same business, painting first as an amateur, and finally devoting himself to art altogether. He painted at first at The Hague, then at Antwerp, lived a long time in Brussels, and went to Paris to perfect himself in technique. He became a master, and for twenty years was accounted the first marine painter of his age. His works are exceedingly numerous. In his private gallery in The Hague he collected paintings and sketches of modern Dutch, Flemish, and French artists selected especially to show their style, method, coloring, and brush work.

Meyer, Lucas, Boer soldier, born in the Orange Free State in 1848; died in Brussels, Aug. 8, 1902. He emigrated to the Transvaal, was one of the founders of the republic in 1884 and its President, and when it was incorporated in the South African Republic in 1886 was elected member for Vryheid in the Volksraad. When war was declared against Great Britain in 1899 he was chairman of the First Volksraad, still sitting for Vryheid, which had Gen. Louis Botha for a second member. Both belonged to the Progressive party, which desired to work with the better class of the Uitlanders in introducing reforms and were willing to make concessions to the British residents, but both stood by President Kruger in his refusal of Mr. Chamberlain's demands and in his decision to defend the independence of the country with arms. When war broke out Lucas Meyer took command of the Vryheid, Utrecht, and Piet Retief burghers. He failed in an attack on the force of Gen. Symons at Talma on Oct. 20, and while commanding the left wing of the Boer forces at the battle of Ladysmith on Oct. 30 he broke down and handed over the command to Louis Botha. He took no further prominent part in active operations, but was an important member of the administrative staff and was one of the

central executive during the latter part of the war when Schalk Burger acted as President. In the final peace negotiations he played a conspicuous part, and when the war was over he went to Europe with other leaders to interest the friends of the Boers in the economical restoration of the conquered republics.

Michie, Alexander, British explorer, born in Earl Ferry, Fifeshire, Scotland, in 1833; died in London, Aug. 8, 1902. He received a commercial training, was sent to Hong-Kong at the age of nineteen, became the Shanghai representative and partner in the firm at the age of twenty-four, and rendered services to Admiral Sir James Hope in operations against the Taiping rebels. He also had much to do with opening treaty ports in northern China. In 1863 he returned to Europe overland, and published *The Siberian Route from Peking to Petersburg through Mongolia and Tartary*. On returning to Shanghai he was sent on a mission to western China, and made a report on Szechuan and other provinces. He returned again to Europe, but went to China again in 1883 and settled in Tientsin. In 1900 he published *An Englishman in China*, a biography of Sir Rutherford Alcock.

Montepin, Count Aymon Xavier de, French novelist and playwright, born in Apremont (Haute Saône), France, March 18, 1824; died in Passy, May 1, 1902. In 1848 he founded the journal *Le Carnard*, and was conspicuous for his antirevolutionist sympathies. He soon forsook journalism for fiction, and for more than forty years poured forth a stream of novels and romances, each work in several volumes. His separate works number more than 350, and many of them were extremely popular. The following is a partial list of Count Montepin's novels: *Les Chevaliers du Lansquenet* (1847); *Les Viveurs d'Autrefois* (1848); *Les Amours d'un Fou* (1849); *Le Brelan de Dames* (1849); *Les Confessions d'un Bohème* (1849-'50); *Le Loup Noir* (1851); *Mignonne* (1851); *Le Vicomte Raphael*; *La Reine de Saba*; *L'Épée du Commandeur*; *Mademoiselle Lucifer*; *Geneviève Gailliot*; *Un Roi de la Mode*; *Le Club des Hironnelles*; *Les Fils de Famille*; *Le Fil d'Ariane*; *Les Oiseaux de Nuit*; *Les Valets de Cœur*; *L'Auberge du Soleil d'Or* (1852-'55); *Un Gentilhomme de Grand Chemin* (1854); *Les Amours de Vénus*; *La Perle du Palais Royal*; *Les Filles de Plâtre* (1855); *Les Viveurs de Paris* (1852-'56); *L'Officier de Fortune* (1857); *Souvenirs intimes d'un Garde du Corps* (1857); *La Maison Rose* (1858); *Les Viveurs de Province* (1859-'60); *La Gitane* (1860); *Le Compère Leroux* (1860); *Un Amour Maudit* (1861); *Les Marionnettes du Diable* (1861); *Les Compagnons de la Torche* (1862); *La Reine de la Nuit* (1863); *Les Pirates de la Seine* (1864); *Les Enfers de Paris* (1865); *La Ferme des Oliviers* (1865); *La Fille Meurtneir* (1866); *Maison Maudite* (1867); *Le Moulin Rouge* (1867); *La Voyante* (1873); *Les Drames de l'Adultère* (1873); *La Femme de Paillasse* (1874); *Les Tragédies de Paris* (1874); *La Vicomtesse Germaine* (1874-'75); *Le Secret de la Comtesse* (1876); *La Sorcière Rouge* (1876); *Le Ventriloque* (1876); *Sa Majesté l'Argent* (1877); *La Batarde* (1877); *Un Débutante* (1877); *La Traite des Blanches* (1877); *Deux Amies de Saint-Denis* (1878); *La Marquise Castella* (1878); *La Morte Vivante* (1878); *Les Drames du Mariage* (1878); *Le Médecin des Folles* (1879); *Le Chalet des Lilas* (1879); *Une Dame de Pique* (1879); *Le Dernier des Courtenay* (1880); *Les Filles de Bronze* (1880); *Le Fiacre* (1880); *Jean Judi, Justice!* (1880); *Sœur Suzanne* (1880); *Henriette de Vauvert* (1880); *La Baladine* (1881); *Les Amours*

d'Olivier (1881); *La Maîtresse Masquée* (1881); *Son Altresse l'Amour* (1881); *La Fille de Marguerite* (1881-'82); *Le Pantins de Mme. le Diable* (1882); *Mme. de Frères* (1882); *Le Secret de Titan* (1883); *Simone et Marie* (1883); *Le Dernier du d'Hallili* (1883); *Les Amours de Province* (1884); *La Demoiselle de Compagnie* (1884); *La Porteuse de Pain* (1884-'85); *Le Crime d'Amières* (1885); *Deux Amours: Hermine, Odille* (1885); *P. L. M. la Belle Angèle* (1885); *Rigolo* (1886); *Les Yeux d'Emma Rose* (1886); *Les Filles du Saltrimbanque* (1886); *Les Dessons de Paris: Le Marchand de Diamants* (1887); *Un Famille Parisienne* (1887); *Le Roman de la Misère* (1887); *Fille de Courtisane* (1887); *Les Débuts d'une Étoile* (1888); *Le Gros Lot* (1888); *La Fée des Saules* (1888); *Le Mariage de Lascar* (1889); *Marâtre* (1890); *La Tireuse de Cartes* (1890); *La Fille de Fou* (1890); *Trois Millions de Dot* (1891); *La Dame aux Émeraudes* (1891). His plays, produced by him singly or in collaboration, include *Les Trois Baisers* (1846); *Le Connétable de Bourbon* (1849); *Les Fleurs Animées*; *Le Rossignol des Salons* (1850); *Les Étoiles* (1850); *Le Vol à la Duchesse* (1857); *Pauline* (with Dumas); *Les Chevaliers du Lansquenet*; *Les Frères Corses*; *La Tour Saint-Jacques la Boucherie* (with Dumas); *Les Viveurs de Paris* (1857); *La Nuit du 20 Septembre* (1858); *La Sirène de Paris* (1860); *L'Homme aux Figures de Cire* (with Dornay) (1865); *Lantara* (1865); *Bas de Cuir* (with Dornay) (1866); *L'Île des Sirènes* (1866); *La Magicienne du Palais Royal* (1866); *Le Médecin des Pauvres* (1866); *Tabarin* (with Grange) (1873); *Le Bearnais* (1876); *La Porteuse de Pain* (with Dornay) (1889). Montepin was emphatically a novelist for the people, and he would have disclaimed pretensions to literary style. His novels bear a strong resemblance to each other, and the same is true of his dramas. He was for a long time identified with *Le Petit Journal*, in every issue of which an instalment of a story of his appeared as a *feuilleton*.

Moraes, José Prudente de, ex-President of Brazil, born in São Paulo; died there, Nov. 30, 1902. He was one of the early republicans of Brazil, the leader of the Liberal movement that began in his own province under his direction, and in the end sapped the throne of Dom Pedro II and eventuated in the revolution of 1889. He was a Deputy in the provincial Legislature, afterward sat in the National Assembly, was Governor of his State after the proclamation of the republic, presided over the Constituent Assembly, became a Federal Senator and Vice-President of the Senate, and, when the military dictatorship of Marshal Floriano Peixoto came to an end after the revolt of the fleet, he was elected the first civil President of Brazil in 1894. During his four years of office he had great difficulties to overcome, and in 1897 he barely escaped assassination. He succeeded nevertheless in pacifying the country. Retiring to his plantation after his administration expired, he led the Opposition party in São Paulo and placed himself at the head of an abortive movement for the revision of the Federal Constitution.

Muefeld, Lucien, French novelist and critic, born Aug. 4, 1870; died in November, 1902. He was sublibrarian of the Sorbonne, 1890-'95, and successively thereafter dramatic critic of the *Revue de l'Art Dramatique*, *Revue Blanche*, and the *Écho de Paris*. He was one of the most brilliant of recent French writers, and his novel *L'Associée*, appearing in book form but a month before his death, at once ran through twenty editions. His other novels are *Le Mauvais Désir* (1898); and *Carrière d'André Tourette* (1900).

Münster zu Derneburg, Georg Herbert, Prince, a German diplomatist, born in London, Dec. 23, 1820; died in Hanover, March 27, 1902. He was the son of the Hanoverian minister at the court of George IV, and after finishing his studies at Bonn, Heidelberg, and Göttingen, he entered the diplomatic service. He represented Hanover at St. Petersburg from 1856 to 1864. In 1866 he tried to arrange an understanding with Prussia, and after Hanover was annexed he left the Guelph party, writing pamphlets in defense of the Prussian supremacy and a book on the political situation in Europe since the Congress of Vienna in 1815. His father had dreamed of uniting the Low Germans and the Dutch under the Hanoverian Guelphs, and therefore his apostasy was flagrant in the eyes of the irreconcilable Hanoverians. He represented Goslar in the Reichstag till 1873, when Prince Bismarck made him minister to London. Count Münster, who was quite English in manners and views of life and had an English wife, a daughter of Lord Roslyn, helped to preserve friendly relations between Germany and Great Britain and to secure the cooperation of the latter in some questions of high politics. In 1886, when it was necessary to find a successor to Prince Hohenlohe, who was cool, firm, and conciliatory, he was transferred to Paris. He won a social success in Paris, as he had in London, and brought about better political relations between the two countries than had existed until the advance toward reconciliation was checked for a time at the formation of the Franco-Russian alliance. Count Münster was delegated to represent Germany in the Peace Conference of The Hague. For his defense of German interests there he received the title of Prince von Derneburg, a title that his father had declined when the Prince Regent of Hanover gave him the old monastic estate of that name for his services at the Vienna Congress. In January, 1901, Prince Münster was succeeded as ambassador at Paris by Prince Radolin.

Murray, Francis Henry, English clergyman, born in Bishop's Court, Isle of Man, in 1820; died in Chislehurst, England, Oct. 11, 1902. He was educated at Oxford, prepared for the Anglican ministry, and was ordained priest in 1845. He officiated as curate of Northfield, Birmingham, from 1843 till 1846, and receiving in the last-named year the living of Chislehurst, continued to hold it as rector till his death. He became rural dean of Dartford in 1887, and was appointed honorary canon of Canterbury Cathedral in 1890. Early in his career Canon Murray associated himself with the Tractarian movement. He took an important part in the compilation of *Hymns, Ancient and Modern*, and was the author of *A Catechism of Authorities with Regard to the Altar and the Eucharistic Sacrifice* (1857); and *The Lord Working with Them* (1888).

Nachbauer, Franz, German tenor, born in Schlossgriesen, Württemberg, in 1835; died in Munich, March 21, 1902. He was a leading tenor singer in Germany for years, his voice having first attracted the attention of Johann Pischek, the famous baritone, who advised him to cultivate it for grand opera. He studied at Milan under Lamperti, and sang in Hanover, Darmstadt, Prague, and Vienna, and was finally engaged as first tenor of the opera in Munich, where he sang until 1889, when he retired from professional life.

Nettleship, John Trivett, English artist and author, born in Kettering, England, Feb. 11, 1841; died in London, Aug. 31, 1902. His education was received at Durham School, and he studied painting under Poynter in the Slade School, Lon-

don. His specialty was the painting of wild animals, and his canvases display much vigor of imagination. Among his more striking pictures are *Puma devouring a Peacock*; *A Big Drink*; *A Death Grip*; *A Mighty Hunter*; *The Blood Trail*; *Blind*; and *Refuge*. His literary work comprises *Robert Browning: Essays and Thoughts*, a valued contribution to Browning literature (1890); and *George Morland and the Evolution from him of Some Later Painters* (1898).

Ommanney, George Druce Wynne, English clergyman, died in London, April 19, 1902, at the age of eighty-three. After receiving an education at Cambridge, he entered the Anglican priesthood in 1843, and was successively curate of Edwinstowe, Notts, in 1843-'49; of Camely, Somerset, in 1849-'52; of Aldbourne, Wilts, in 1852-'53; and of Woodborough, Wilts, in 1857-'58. He was vicar of Quern Charlton, near Bristol, in 1852-'62; curate of Whitchurch, Somerset, in 1862-'75; and vicar of Draycot, Somerset, in 1875-'88. From 1884 until his death he was a prebendary of Wells Cathedral. He was the author of *The Athanasian Creed with Reference to its Damatory Clauses* (1872); *The Athanasian Creed: Its Uses in the Services of the Church* (1872); *The Athanasian Creed: An Examination of Recent Theories respecting its Date and Origin* (1875); *The Early History of the Athanasian Creed* (1880); *Marriage with a Deceased Wife's Sister* (1883); *The S. P. C. K. and the Creed of Saint Athanasius* (1884).

Owen, Robert, English clergyman, born about 1820; died in Barmouth, Wales, April 8, 1902. He was educated at Oxford, and although he took orders he never held preferment, but passed his life in study. He professed to follow the lines laid down by Newman and Keble in the earlier stages of the Oxford movement. His writings include *The Kymri: Their Origin, History, and International Relations* (1891).

Parker, Joseph, English non-conformist preacher, born in Hexham, Northumberland, April 9, 1830; died in London, Nov. 28, 1902. When twelve years old he became a teetotaler

and organized a drum-and-fife band in the temperance cause. He taught himself elocution, becoming a good speaker before he was seventeen. In June, 1840, he delivered his first sermon in a saw-pit on a village green. Next he taught a school, at the same time engaging in vigorous itinerant preaching. In 1851 he married

Annie Nesbitt, a farmer's daughter, who died twelve years later. He was ordained a minister of the Congregational Church at Banbury in 1853. Five years later he became pastor of Cavendish Street Chapel, Manchester, where he remained eleven years. In 1864 he married Emma Jane Common, who for thirty-four years was a valuable assistance to him in his ministry. His fame soon became world-wide, and Chicago University gave him the degree of D.D. In 1869

Dr. Parker went to London at the repeated invitation of the oldest Congregational body in that city. Here he built the City Temple, which was opened on May 19, 1874, and his ministry there was interrupted only by brief vacations. He was no respecter of persons, and freely denounced the Prince of Wales (now King) for his gambling and immoralities and the Sultan of Turkey for his atrocities. He several times visited the United States, preaching in Plymouth Church, Brooklyn, and delivering a eulogy on Henry Ward Beecher in that city. Although startling in his methods, he was orthodox as to the fundamentals of Christianity, as shown by his book *Ecce Deus* (1868), in answer to Prof. Seeley's *Ecce Homo*. He also wrote *Emmanuel* (1859); *Springdale Abbey* (1869); *Ad Clerum* (1870); *The Paraclete* (1874); *The Priesthood of Christ* (1876); *The Inner Life of Christ* (1881); *Apostolic Life* (1884); *Tyne Chylde* (1883); and an autobiography (1899). His sermons were published in a series of 25 volumes, under the title of *The People's Bible*.

Paul, Charles Kegan, English publisher and author, born in White Lackington, Somerset, England, March 8, 1828; died in London, July 19, 1902. He was educated at Eton and Oxford. He took orders in the Anglican Church, and was curate of Great Tew in 1851, and at Bloxham in 1852. After spending ten years as tutor at Eton, he became vicar of Sturminster, Dorset, remaining there nine years. His religious views having now assumed a positivist character, he resigned his living, and became reader for the publishing house of Henry S. King, whom he succeeded in the business. With him was presently associated a son of Archbishop Trench, and the firm published several valuable series of books and *The Nineteenth Century*. Later Mr. Paul met with reverses, and the firm became a limited company, of which he long continued as manager, retiring in 1899. In his latest years he entered the Roman Catholic Church. His writings include a *Translation of Faust* (1873); *William Godwin: His Friends and Contemporaries* (1876); *Mary Woolstoncraft's Letters to Imlay, with Memoir* (1878); *Biographical Sketches* (1883); *Maria Drummond: A Sketch* (1891); *Faith and Unfaith* (1891); *Confessio Viatoris* (1891); a translation of *Huysman's En Route*; *By the Wayside* (verse); *Memories* (1899).

Pauncefote, Julian, Lord, English diplomatist, born in 1828; died in Washington, May 24, 1902. He was the son of a country gentleman of Gloucestershire, was educated at Marlborough College and in Paris and Geneva, was called to the bar in 1852, and practised as a barrister and later as a conveyancer, with a short intermission when he was private secretary to Sir Samuel Molesworth, Colonial Minister. In 1862 he went to Hong-Kong, where he became Attorney-General in 1865, was a member of the Legislative and Executive Councils, and became Chief Justice. In 1872 he went to the Leeward Islands as Chief Justice, and on returning to England in 1874 became legal assistant at the Colonial Office. In 1876 he was appointed legal assistant under-secretary at the Foreign Office and received the colonial order of knighthood. In 1882 Sir Julian Pauncefote was appointed permanent Under-Secretary of State for Foreign Affairs. He represented Great Britain in 1885 on the Suez Canal commission at Paris, and in 1888 was made a knight of the Bath. In 1889 he was selected to restore to a normal footing diplomatic relations with the United States, which had been left in the care of a *chargé d'affaires* since President

Cleveland in the previous year had given his passports to Sir Lionel Sackville West. There were many unsettled questions between England and the United States, and Lord Salisbury decided to try the experiment of entrusting the delicate situation to a man of legal and judicial training, hoping that this would prove a better equipment for dealing with American statesmen than diplomatic experience. The principle of arbitration was accepted in the Bering Sea dispute in 1890 and a treaty was signed in 1892. He managed the critical Venezuela question in such a way as to extricate his Government from an embarrassing position with the least possible loss of dignity. As a solace he negotiated the general arbitration treaty between Great Britain and the United States, but by the vote of the Senate such an entanglement was avoided. He sought unsuccessfully to clear away the vexatious petty questions that caused friction between the United States and Canada through a joint commission. He arranged a *modus vivendi* and a provisional boundary in the Alaska frontier dispute. He endeavored to replace the mischievous Clayton-Bulwer treaty with one that preserved an equivalent for the advantages that it gratuitously gave to Great Britain, and when the Senate rejected this he arranged a compromise between the Senate and Lord Lansdowne. The British legation was raised to the rank of an embassy in 1893, Congress having passed an act for the promotion of American ministers to be ambassador to such powers as should send ambassadors to the United States. Sir Julian Pauncefote was the first of the ambassadors to present his credentials. In 1898 he reached the legal age for retirement, but he was requested to remain for another year, and at its close the request was repeated, he having been meanwhile raised to the peerage as Baron Pauncefote of Preston in recognition of his services at The Hague Peace Conference, and when the second year had passed, as difficult negotiations were not yet concluded and a presidential election was near, he was still retained at his post. At the time when the Spanish War was imminent he was the dean of the diplomatic body at Washington. The European cabinets were considering among themselves some means of bringing pressure upon the United States to prevent the threatened intervention in Cuba. The policy of England was to hold herself apart and gain credit and prestige by preventing war either by independent action or by dictating the concerted action. The British ambassador sounded the American Government as to the prospects of mediation and found that it would not be acceptable. When the representatives of the powers, who had already presented a note to the President expressing hopes for a peaceful outcome, proposed to present another joint note, he drew up one in terms which he ascertained that the President would receive. Suggestions of an imperative remonstrance were made by the Austrian minister. Alterations were

made at the suggestion of his colleagues, and it was referred to the respective governments. The British Government vetoed the presentation of such a remonstrance, and so did the German Government. Lord Pauncefoot was the senior British delegate to the Peace Conference at The Hague in 1899. His work in drafting with Mr. Olney the proposed Anglo-American arbitration treaty had made him one of the greatest experts and enthusiasts on the subject of international arbitration. To him and to the American delegates more than to any others was due the successful outcome of the conference, and it was at their suggestion that a permanent arbitration tribunal was created.

Peach, Edward, English army officer, born in 1865; died in December, 1902. His education was obtained at King's College, London, and Sandhurst Military College, and he entered the army in 1884, serving in the Burmese expedition of 1885-'86. He was gazetted captain in 1895, and served on the northwest India frontiers 1897-'98, and in South Africa during 1897-'98. For bravery in the latter service he was brevetted major. He was the author of *Savage Warfare*, a work officially recommended to the army and subsequently adopted as a text-book for infantry training.

Pollen, John Hungerford, English art critic, born Nov. 19, 1820; died in London, Dec. 2, 1902. He was educated at Oxford, studied art, and while fellow of Merton decorated the ceiling of the college chapel. Taking orders in the English Church, he was for five years rector of Saint Saviour's Church, Leeds, but later was one of the followers of the second Oxford Movement to Rome, and was appointed Professor of Fine Arts in the Catholic University of Dublin. He was married in 1855, and three of his sons became Roman Catholic priests. He belonged to various archeological and art societies, and was official editor of the *South Kensington Museum*. His published writings comprise *Decorative Art in its Connection with Modern Science* (1863); *Ancient and Modern Furniture and Woodwork in the South Kensington Museum* (1874); *The Trajan Column* (1874); *Gold and Silversmith's Work* (1876); *Furniture and Modern Woodwork* (1876); and *Ancient and Modern Gold and Silversmith's Work in the South Kensington Museum* (1878).

Pyetsoff, Mikhail Vasilievich, Russian geographer, born in 1843; died March 10, 1902. He received his early education in a military school, and finished in the academy of the general staff. After completing his studies he remained for fifteen years in the general staff at Omsk, making important journeys in Dzungaria and northwestern Mongolia. He was also connected with the great Chinese surveys in 1880 for determining the Russo-Chinese boundary-line. The scientific results of the first two journeys were published in the *Memoirs of the West Siberian Geographical Society*. After the sudden death of Prjevalsky, Pyetsoff was made head of the Tibet expedition, and in company with Roborovsky and Kozloff and the geologist Bogdanovitch, he spent two years in eastern Turkestan and the Gobi. The results of these expeditions were published in 3 large volumes by the Russian Geographical Society. He also published an important paper on the determination of latitudes from the corresponding altitudes of stars, and another on barometrical levelings.

Rawlinson, George, English Orientalist, born in Chadlington, Oxfordshire, England, Nov. 23, 1815; died in London, Oct. 6, 1902. He was a younger brother of Sir Henry Rawlinson, the diplomatist and Oriental scholar, and was educated at Oxford. He took orders in the Estab-

lished Church and was appointed a fellow of Exeter College in 1840. He was tutor in 1842, sub-rector in 1845, and in 1859 was Bampton lecturer at the university. Two years later he received the Camden professorship of Ancient History at Oxford. His friend Mr. Gladstone preferred him to a canonry of Canterbury Cathedral in 1872. An unfortunate indistinctness of utterance prevented him from being effective as a public speaker, and it occasioned some comment when in 1888 he accepted the living of All Hallows, Lombard Street, London, with its annual income of £2,000, when he already held a lucrative canonry and his professorship besides. He, however, resigned the Camden professorship the next year; but for some years prior to his death his duties at All Hallows were performed by proxy. Canon Rawlinson was a sound scholar, and his historical labors have been of great value to his generation. His writings in book form comprise an annotated edition of Herodotus, prepared with his brother Henry and Sir George Wilkinson (1858-'60); *The Historical Evidences of the Truth of the Scripture Records* (1860); *The Contrast of Christianity with Heathen and Jewish Systems* (1861); *The Five Great Monarchies of the Ancient Eastern World*, the work by which he will be longest remembered (1862-'67); *A Manual of Ancient History* (1869); *Historical Illustrations of the Old Testament* (1871); *The Sixth Great Oriental Monarch, or the Geography, History, and Antiquities of Parthia* (1873); *The Seventh Great Monarchy, or the Geography, History, and Antiquities of the Sassanian or New Persian Empire* (1876); *The Origin of Nations* (1877); *Saint Paul in Damascus and Arabia* (1877); *Ezra, Nehemiah, and Esther in Pulpit Commentary* (1880); *History of Ancient Egypt* (1881); *Exodus in Pulpit Commentary* (1882-'85); *Religions of the Ancient World* (1882); *The Antiquity of Man Historically Considered* (1882); *The Early Prevalence of Monotheistic Beliefs* (1883); *Egypt and Babylon from Scriptural and Profane Sources* (1884); *Religious Teachings of the Sublime and Beautiful in Nature* (1884); *Bible Topography* (1886); *Ancient History* (1887); *Ancient Egypt, in Stories of the Nations Series* (1887); *Moses: His Life and Times* (1887); *A History of Phœnicia* (1889); *The Kings of Israel and Judah* (1889); *Isaac and Jacob: Their Lives and Times* (1890); *Ezra and Nehemiah: Their Lives and Times* (1891); *Parthia, in Stories of the Nations Series* (1893); and *A Memoir of Major-General Sir Henry Creswicke Rawlinson* (1898).

Renon, Emil Jean, French meteorologist, born in Vendôme, March 8, 1815; died in Parc St. Maur, April 6, 1902. He spent two years at the German universities, being especially attracted by Gauss's lectures at Göttingen. From 1839 to 1842 he was attached to the scientific commission of Algeria, and he published a *Description Géologique de l'Algérie*. He subsequently published a similar general descriptive work on Morocco. He was active in founding the *Société Météorologique* in 1853, was its secretary eleven years, and was four times elected to its presidency. He was one of the meteorological committee that established the Observatory of Montsouris. In 1872 he was officially appointed director of a laboratory of meteorology, an office which he held until his death. The laboratory was first located at Choisy le Roi, was soon moved to Parc St. Maur, and on the establishment of the *Bureau Centrale de Météorologie*, was finally located on the plot of ground assigned the bureau, where it still remains. In

1847 he became a chevalier of the Legion of Honor; in 1884 an officer; in 1873 an Officier de l'Académie, and Officier de la Instruction Publique in 1891.

Rhodes, Cecil John, a South African politician, born in Bishop's Stortford, Hertfordshire, July 5, 1853; died in Cape Town, March 26, 1902. He was one of the seven sons of a country clergyman and was sent to school to prepare for Oxford and the clerical profession. When he was

sixteen his health became so delicate from a heart affection that he was sent out to his brother's farm in Natal. Finding the farm deserted by his brother, who had joined the rush to the diamond-fields, he undertook to manage it, and planted cotton, which was then being tested on some of the large estates and discussed as a promising new

culture. He was successful enough with his crop to win a prize, and then quit farming, his brother having written to him of the chances to make money in Kimberley. After one year of diamond-mining he found himself very rich at the age of eighteen, owner of some of the best claims and in receipt of a large income. His health at the same time had become robust. He determined to return to England and complete his education at Oxford. Before sailing he made a long journey through the northern veldt, occupied only by savage tribes and scattered Boers whose flocks and herds grazed over farms as large as counties, with wide spaces where only the wild antelopes roved. His slow trip in a Cape wagon drawn by ox-teams to Mafeking and through the Transvaal to Pretoria and back to Kimberley impressed his youthful imagination with the immensity of this salubrious region that had changed him from a weakling into an athlete, and already he dreamed of gaining this new empire for England, with its agricultural and mineral wealth that when tapped only in spots on the border gave such surprising returns as he had seen in Natal and at Kimberley. He traveled in this way for eight months, then returned to England in the latter part of 1872 and matriculated at Oriel College. He remained only six months, for though he hunted and roved his heart became weak again and his lungs diseased to such an extent that a famous London physician, in approving his desire to go out again to South Africa, privately made a note predicting a fatal termination of the case in six months. In three more years at Kimberley he reestablished his health and increased his fortune until his property in diamond-mines was second to none. He was still determined to take his degree at the university, though he could not neglect his important business interests, so in 1876 and the two following years he kept his terms at Oxford, spending the rest of the year at Kimberley, and by reading in the intervals of affairs he managed to pass the examinations. Only far-reaching schemes, not ordinary details of business, could hold the attention of this young gentleman of ideas who, starting penniless and giving only

half his mind to it, had become a great capitalist at twenty-five. The yield of the Kimberley mines, when American engineering methods were employed, increased by leaps and outstripped the consumption, although an unlimited demand for diamonds was growing up in the United States and other countries. The competition of the different mines was likely to destroy the market and render the mining properties valueless, for unless prices could be kept firm the demand would naturally diminish, instead of continuing to increase. Cecil Rhodes, who was the managing director and principal owner of the De Beers, the largest of the companies, was one of the first to see that the remedy was consolidation and limitation of output, and was the first to act. He gradually absorbed the smaller concerns, and then negotiated an amalgamation with the large companies. When dealing with the two chief operators besides himself he agreed to the terms they asked on condition that his one demand should be complied with, which was that the profits of the new De Beers consolidated company might be used for political purposes in extending British rule over the northern countries. The conferees objected that this was not business, to which he replied that it was his business. He cared little for what money could buy and nothing for money in itself, but he had an exaggerated opinion of its potentiality in bringing about political results, believing that there was no use in having big ideas if you have not the money to carry them out. The first three years after his arrival saw the completion of the first amalgamation, whereby the competition of the small mining concerns that were cutting prices was removed and arrangements could be made with the large corporations to divide the market. This business ended, Cecil Rhodes entered the Cape Legislature in 1881 as member of the Assembly for Kimberley. He went over to England in the same year to take his degree at Oxford. In the Assembly he came at once into conflict with Paul Kruger, under whose lead the Transvaal Boers had recovered their independence, one of the conditions being that they should not extend their rule to the westward of the existing boundaries into Bechuanaland or Griqualand West. Individual Boers, however, went over the border and by treaty with native chiefs obtained territory on which they based the independent republic of Stellaland. No expansion of British territory northward was at that time desired, the Little England policy being predominant in Great Britain, but in Cape Colony Rhodes worked up a sentiment of jealousy of the Transvaal, and in England, too, by pointing out the danger of Germany and the Transvaal shutting off the trade route to the north, he won approval of his plan of acquiring Bechuanaland. While a member of the commission appointed to fix the western boundary of the Transvaal he obtained a cession of the lands of Mankaroane, one of the Bechuana chiefs, and by virtue of this a British protectorate was declared over all Bechuanaland in 1884 and a treaty was made with the Transvaal in which in return for the ostensible withdrawal of the claim of suzerainty they accepted the boundary laid down for them on the west and agreed to confine themselves within their existing frontier on the north. Rhodes already had practical plans of an indefinite imperial expansion northward. He could accomplish nothing in Cape politics if he identified himself with the British party, and therefore, having persuaded the Dutch at the Cape of the advantage and necessity for the future of their commonwealth of

holding the Boer republics and German ambitions in check and extending its trade and power northward, which only the Imperial Government could do for them, he wrested the leadership of the Afrikaner party from Hofmeyr, the advocate of a United States of South Africa under its own flag. This he did not accomplish until he had attained brilliant imperial successes that conferred prestige and material advantages upon Cape Colony. The Boer intruders who had seized the trade route in Bechuanaland were ousted by means of a military expedition under Sir Charles Warren, sanctioned by the Gladstone Government because Sir Hercules Robinson, Governor of the Cape of Good Hope, had adopted the views of Cecil Rhodes. These views of imperial expansion, which expanded themselves into a vision of the whole of the eastern side of Africa from the Cape to Cairo under the British flag, did not imply English rule in South Africa or imperial control of the kind that had often exasperated the Dutch. He was as earnest an upholder of self-government and in general of the Dutch views of policy in native, educational, fiscal, and other matters as the Bond leaders. The only essential difference between him and Paul Kruger, his great antagonist, was that he wanted to preserve the imperial connection, whereas the Transvaal President wanted to unite South Africa under republican institutions. Cape Colony was not willing to assume expenses or responsibilities, and the benefits that Rhodes bestowed on the colony were obtained at the charge of the Imperial Government or, more frequently, by means of private funds that were given into his hands for his enterprises, combining commercial speculation with empire building. In the final consolidation of the Kimberley mines, completed in 1887, the trust deed placed large sums at his disposal for political purposes, and other funds were raised among the financial men of London who were delighted with schemes of gain in which possible losses could be charged to patriotism. Cape Colony declined to take Bechuanaland at first, but Rhodes made it British, and then proceeded to expand the empire as a private enterprise. The Matabele chief, Lobengula, whose Zulu warriors terrorized all the region between the Transvaal and the Zambesi, was courted both by Boers and Germans and by English agents who furnished him with guns and money in return for equivocal concessions. Rhodes negotiated with him for the right to hunt gold in the territories over which he claimed sway, and in virtue of this concession obtained in 1889 a royal charter conferring on the British South Africa Company, which he formed, political and military dominion and a commercial and industrial monopoly in the name of the British Crown over the whole basin of the Zambesi, necessitating a warlike demonstration against Portugal, who had claimed all this territory for centuries. Cecil Rhodes took the whole management of this extraordinary enterprise, built a railroad through to Mashonaland, and afterward another from the east coast, endeavored to open the mines, and did attract a community of gold-seekers to the country. When he went to England in 1888 to organize the chartered company he contributed £10,000 to the funds of the Irish home-rule party. His idea was to weaken, not to strengthen, the central power and the authority of England in the empire. He hoped to see separate parliaments in both Ireland and Scotland and an imperial federation in which the self-governing colonies would each have its proportional representation in the imperial Parliament. He extended the operations

of the chartered company beyond the Zambesi up to Lake Tanganyika, subsidized the British colony in Nyasaland, and promised to build a telegraph-line through the length of Africa in order to dissuade the Imperial Government from abandoning Uganda. When Lobengula, declaring that he had only given the English a right to dig gold, not to rule the country, disputed the authority of the company, Cecil Rhodes organized a military force and in a rapid and ruthless campaign half exterminated the Matabele. With cool courage he went without a guard to Lobengula's kraal and made peace on his own terms. He became the most conspicuous figure in Cape politics as soon as he had annexed to the British Empire and brought within the political and economical ambit of Anglo-Dutch South Africa territories nearly as great as British India, full of material resources and commercial possibilities. He entered into an alliance with Mr. Hofmeyr's Afrikaner Bond, and in 1890 took the premiership of Cape Colony, dazzling both the British and the Dutch parties with his brilliant imperialistic schemes, on the strength of which he induced the former to accept the Dutch domestic and native policy, the latter to adopt imperialism. By the act of 1892 the native franchise was curtailed. Cecil Rhodes, who managed thousands of Kaffirs in the mines and was the originator of the compound system, disbelieved in the political and social equality of blacks and whites as thoroughly as any Boer. In 1895 the author of the most remarkable political concord that ever existed in South Africa himself broke the charm and let loose again political rancor and racial jealousy by a sinister, corrupt, and criminal political intrigue as base and dishonest as was ever conceived by a desperate adventurer. He did not concoct the conspiracy alone. Members of the British Cabinet, especially Joseph Chamberlain, were involved in the guilt in a degree that has never been disclosed. Cecil Rhodes, however, was probably the prime mover, and certainly the organizer and director of the conspiracy, and he had to bear the odium, although the fiasco in which his plot ended was due to the precipitate action of his agents. After the discovery of gold in the Witwatersrand in 1886 and the growth of a mining population in Johannesburg almost as numerous as the Boers in the Transvaal, Rhodes, with the concurrence of his financial partners and friends in Kimberley and London, all of whom were deeply interested with him in the gold-mines that came to surpass the diamond-mines and all other South African industries together, used money freely to work up a British imperialist agitation among the Uitlander population with the view of making it his instrument in changing the Boer republics into British colonies, so as to hasten the realization of a British South African federation. The Uitlanders had come, not from British lands alone, but from many countries, some of the most influential of them from the United States. The republicans among them were in a large majority, but all desired the full franchise and had common grievances against President Kruger's Government. The local jealousy felt at the Cape toward the Transvaal greatly increased when the republican Government had a fiscal control over the main source of wealth in South Africa and built independent lines of railroads to the seaboard. *This sentiment began to veer around, however, when the British Government undertook to dictate to the Transvaal about the electoral franchise, schools, and taxation. While the discontent of the Uitlanders was stimulated

by organized agitation and the British annexationists among them were represented as including the whole population, the agents of Rhodes hatched a plot to overthrow the Government of President Kruger by a revolutionary uprising. Arms and ammunition bought with funds of the De Beers corporation were smuggled into the country. Rhodes planned a simultaneous invasion of the republic by his Mashonaland troopers, most of whom volunteered for the adventure on being assured by Dr. Jameson, Rhodes's representative and administrator in Matabeleland, that it was unofficially authorized by the British Government. When the appointed time for the revolution was at hand a hitch occurred in the negotiations still going on between the arch conspirator and the revolutionary committee, an American member of which, who had the widest influence in the Uitlander community, refusing to sanction the raising of the British flag, while Rhodes would not sanction the insurrection on any other conditions. Dr. Jameson, whose force was waiting impatiently on the border for the signal, led them into the Transvaal and rode into a Boer ambush near Pretoria, for President Kruger was well informed of Rhodes's plans and was able to lay hands on the arms in Johannesburg and the chief conspirators. The Jameson raid led to the Boer War, and the policy of Cecil Rhodes triumphed, though he was in eclipse and disgrace. He frankly acknowledged his culpability, immediately resigned as Prime Minister of the Cape Government, went to the territory of the British South Africa Company, called after him Rhodesia, although he had to give up his chairmanship and seat in the directorate, and intended to devote his energies and his surplus capital to developing the agricultural and industrial resources of the new colony he had created. On arriving there he found an opportunity to exercise his executive ability and fertility of resource in conducting the military operations of the Matabele war, which begun in March, 1896. After his railroad from Kimberley was completed to Buluwayo he raised capital in England for its continuance to Tanganyika and persuaded the British Government to lease territory from the Congo State for carrying it through to Uganda in order to realize the scheme of a continuous railroad from the Cape to Cairo. The German Government having objected to this lease, he arranged in an interview with the Kaiser for a German link in his projected line and its operation in connection with the railroads to the coast in German East Africa. He was still member of the Assembly for Kimberley, yet during the negotiations that ended in war he never raised his voice or took any active part in political affairs. Anticipating that Kimberley would have to stand a siege, he went thither after the beginning of hostilities, accumulated large stores of food and other things, and supplied the military authorities with many necessary things, including arms and ammunition and mechanical aids from his workshops and helped to feed the garrison and the population. He attempted to assume control of the operations, but the military men resented his interference. The strain broke down his health. He was a bachelor, and in his will he left his estate outside of Cape Town to be the residence of the Prime Minister of the future United States of South Africa, and, besides a bequest of £100,000 to Oriel College, he left the bulk of his estate to endow scholarships at Oxford worth £300 a year for three years, colonial scholarships and additional American scholarships to be filled—3 each year from

Rhodesia, 4 from colleges of Cape Colony, 1 from Natal, 1 from each Australian colony, 1 from New Zealand, 1 from Ontario, 1 from Quebec, 1 from Newfoundland, 1 from Bermuda, 1 from Jamaica, and 2 from each State and Territory of the American Union. By a codicil he founded 5 German scholarships of £250 a year to be allotted by the German Emperor to students of German birth. He hoped that the intercourse of selected American and German students with young Englishmen at the university would help to secure the peace of the world by cementing a good understanding between England, Germany, and the United States, since educational relations form the strongest tie. Desiring that the scholarships should not be conferred on mere bookworms, he directed that qualities of manhood, truth, courage, devotion to duty, sympathy for and protection of the weak, kindness, unselfishness, and fellowship, taken together, should rank with literary and scholastic attainments as the chief qualifications, and fondness for and success in outdoor sports and the exhibition of moral force of character and of instincts to lead and take an interest in schoolmates as the two minor qualifications to be rated at two-thirds of the value of the others.

Rickert, Heinrich, German politician, born in Putzig in 1833; died in Berlin, Nov. 3, 1902. He represented the town of Danzig for thirty years in the Prussian Chamber and in the Reichstag. He was leader of the group of free-traders that seceded from the National Liberal party in 1879 on account of Bismarck's adoption of a protectionist policy and formed the Liberal Union, which in 1884 coalesced with the Freisinnige party of Eugen Richter. He led the Moderate section of the Radical party, and in 1884 he and his followers seceded from the advanced section to support Count Caprivi's army bill in the hope of bringing about a Liberal administration. His group, known as the Freisinnige Vereinigung, has since then supported the Government's efforts to strengthen the army and navy, to acquire colonies, and to play a greater part in the world's politics, but without altering its position in regard to aristocratic privileges, protection, and domestic policy.

Roberts-Austen, William Chandler, English metallurgical chemist, born in 1843; died Nov. 22, 1902. In 1885 he obtained the royal license to take the name of Austen. He was graduated at the Royal School of Mines in London, obtained employment in the mint, and in 1869 became assayer there. In 1882 he became Queen's assay master. In 1890 he was appointed to the chair of Metallurgy at the Royal School of Mines, which he held until his death. He published metallurgical memoirs, especially in connection with the alloying of copper and gold. He was elected a fellow of the Royal Society in 1875; was president of the Iron and Steel Institute in 1899; served on the British Executive Committee of the Paris Exhibition of 1889; and was vice-president of the International Mining and Metallurgical Congress in Paris, receiving the Cross of Chevalier of the Legion of Honor. In 1888 he was made a C. B., and in 1899 K. C. B. He was a D. C. L. of the University of Durham. As a teacher he is said to have been a universal favorite.

Royal, Joseph, Canadian journalist and statesman, born in Repentigny in 1837; died in Montreal, Aug. 23, 1902. He was educated in the Jesuit College of St. Mary's in Montreal and began newspaper work in 1857 on the staff of *La Minerve*, founded *Le Nouveau Monde* in the same year, and *L'Ordre* in 1859. In 1864 he was one of the founders of the *Revue Canadienne*, to which he contributed articles on political subjects. He

settled in Manitoba in 1870 and started *Le Métis*, entering the same time upon the active practise of law, having been admitted to the bar in 1864. He defended Lépine and Naud, who were tried as murderers for having when members of Louis Riel's provisional Government ordered the execution of Thomas Scott. He sat in the Manitoba Legislature from its creation in 1870 until he was elected in 1879 to the Dominion Parliament, and while in the Legislature he was speaker and afterward provincial Secretary, Attorney-General, and Minister of Public Works. He carried through the school law of 1871, the act abolishing the Legislative Council, and the act creating the University of Manitoba, and he secured more favorable financial arrangements with the Dominion. He was returned to the House of Commons until, in 1888, he was appointed Lieutenant-Governor of the Northwest Territories. After the expiration of his term in 1893 he became editor of *La Minerve*.

Boyer, Clémence, French scientific writer, born in Brittany in 1830; died in Paris, Feb. 3, 1902. She intended in her youth to become a nun, afterward studied at the Sorbonne and the Collège de France, went to Lausanne in 1860, instituted a course of logic for women, shared with Prudhomme a Government prize for an essay on the theory of taxation, and was the translator and defender in France of Darwin's theories. She published a famous pamphlet on a national church for the republic, a work on *Le Bien et la Loi Morale* in 1881, and an original treatise on the atomic theory entitled *La Constitution du Monde* in 1890, besides memoirs on anthropological and archeological subjects.

Rute, Mme. Marie Letizia de Studolmine Solms, Ratazzi de (Wyse), commonly known as Mme. Ratazzi, daughter of Sir Thomas Wyse, an English ambassador to Athens, and Letitia Bonaparte, a niece of the first Napoleon, born in Waterford, Ireland, in 1833; died in Paris in February, 1902. Her first marriage was in 1848 to Frédéric de Solms, a wealthy Alsatian, who died in 1861, and in 1863 she married the Italian statesman Urbain Ratazzi, who died in 1873. Four years afterward she married De Rute, a Spaniard. Exiled from Paris after the *coup d'état*, in 1852, she established a journal, *Les Matinées d'Aix*, to which she contributed sketches in prose and verse. She was allowed to return in 1860, but was again sent to exile in 1864, partly on account of the publication of her book *Les Mariages d'une Créole*. Besides publishing many works in prose and verse, she contributed to many journals, and with her talents, and her great beauty at one period of her career, she played a conspicuous part in literary and political circles during the second empire. The following is an incomplete list of her published books: *Nice, Ancienne et Moderne* (1854); *La Dupinade* (1859); *Les Chants de l'Exilée* (1859); *Fleurs d'Italie: Poésies et Légendes* (1859); *Bontandes* (1860); *La Réputation d'une Femme* (1862); *Mademoiselle Million* (1863); *Les Mariages d'une Créole* (1864); *Le Piège aux Maris* (1865); *Les Rives de l'Arno*, poems (1865); *Les Soirées d'Aix les Bains*, prose and verse (1865); *La Forge* (1865); *La Mexicaine* (1866); *Bichenelle* (1867); *Si j'étais Reine* (1868); *Louise de Kerner* (1868); *Le Rêve d'une Ambitieuse* (1868); *Nice la Belle* (1870); *Florence* (1870); *Cara Patria*, verse (1873); *L'Ombre de la Mort*, verse (1875); *L'Espagne Moderne* (1879); *Le Portugal a vol d'Oiseau* (1880); *Ratazzi et son Temps* (edited) (1881); *La Belle Juive* (1882); *L'Aventurière des Colonies*, a drama (1885); and *Enigme sans Clef*, a collection of tales (1894).

Sargeant, Lewis, English journalist, born in 1841; died in Bournemouth, England, Feb. 2, 1902. He was educated at Cambridge, and for six years preceding his death had been a member of the editorial staff of the *London Daily Chronicle*. He was an authority on educational subjects, and was a man of wide learning and exceptional breadth of view. Since 1878 he had been honorary secretary of the Greek Committee in London, and for his services to Greece he was created knight of the Greek Order of the Redeemer. His published books include *An Introduction to English Composition* (1872); *Elementary Mathematics* (1873); *New Greece* (1878); *England's Policy* (1881); *William Pitt* (1882); *The Government Handbook* (1890); *John Wiclif* (1893); *Greece in the Nineteenth Century* (1897); *The Franks from their Origin as a Confederacy to the Establishment of the Kingdom of France and the German Empire* (1898); and *The Caprice of Julia*, a novel (1899).

Schafarik, Adalbert Vojtěch, Bohemian chemist and astronomer, born in Neusatz in Súdungarn, Oct. 26, 1829; died in Prague, July 2, 1902. From 1856 to 1858 he studied in Berlin and Göttingen with Wöhler. He became Professor of Chemistry in the Bohemian Polytechnicum in 1862, and in 1882 was appointed to the chair of Chemistry in the Bohemian University. His last chemical paper was published in 1872. After this time he devoted himself chiefly to astronomical investigations, which he carried out in his private observatory. He held the chair of Descriptive Astronomy in the Bohemian University from 1892 to 1896. He was an adept at grinding and polishing metallic and glass mirrors. He translated the works of Alexander Humboldt into Bohemian, and left a long series of astronomical manuscripts, which he was prevented by failing health from publishing.

Schenk, Leopold, Hungarian embryologist, born in 1841; died in Schwanberg, Styria, Aug. 17, 1902. He was a distinguished Professor of Embryology when he published a work that created much popular discussion and was received with skepticism in the scientific world, in which he advanced a theory that the sex of children can be artificially predetermined by a regimen of food.

Scholl, Aurélien, French journalist and author, born in Bordeaux, July 13, 1833; died in Paris, April 16, 1902. He was the son of a notary, and after studying in the schools of Bordeaux he went to Paris to embark on a literary career. He became an incisive newspaper writer, writing in 1850 for the *Corsair*, and after it was suppressed in 1852 he was connected successively with the *Paris*, the *Mousquetaire*, *L'Illustration*, and the weekly *Figaro*, revived the *Satan*, and started *La Silhouette*, *Le Nain Jaune*, *Le Club*, *Le Jockey*, and *Le Lorgnon*. From 1872 he was associate editor of *L'Événement*, and was chief editor for a season of both the *Voltaire* and *L'Écho de Paris*. He fought many sensational duels and made himself a conspicuous figure in the public eye by his marriage with the rich Alice Perkins, of London, and its sequel, and by other adventures. He published *Lettres à mon Domestique* in 1854; *Les Esprits Malades* in 1855; *Dénise* in 1857; *La Foire aux Artistes* in 1858; *Claude de Borgne* in 1859; *Les Mauvais Instincts* in 1860; *Aventures Romanesques* in 1862; *Hélène Herrmann*, *Les Amours de Théâtre*, and *Scènes et Mensonges Parisiens* in 1863; *Gens Tarés* in 1864; *Les Cris de Paon* and *L'Outrage* in 1866; *Les Nouveaux Mystères de Paris* and *Les Petits Secrets de la Comédie* in 1867; *Dictionnaire Féodal* in 1869; *La Danse de Palmiers* in 1873; *Les Amours de Cinq*

Minutes in 1875; *Le Procès de Jésus-Christ* in 1877; *Les Scandales du Jour* in 1878; *Fleurs d'Adultère* in 1880; *L'Orgie Parisienne* and *Mémoire du Trottoir* in 1882; *Les Nuits Sanglantes* and *Fruits Défendus* in 1885; *Roman de Follette*, *L'Esprit du Boulevard*, and *Les Fables de La Fontaine* in 1886; *Paris en Caleçon* in 1887; *Paris aux cent Coups* in 1888; and *L'Amour appris sans Maître* in 1891. He also wrote *Jaloux du Passé*, a one-act comedy produced in 1861; *Singuliers Effets de la Foudre*, in collaboration with Théodore de Langeac, in 1863; *La Question d'Amour*, with Paul Bocage, in 1864; *Les Chaines de Fleurs* in 1866; *L'Hôtel des Illusions*, a vaudeville, in 1869; *On Demande une Femme Honnête*, with M. V. Koning, in 1877; *Le Repentir* and *Le Nid des Autres*, with M. A. Artois, in 1878.

Senussi, Sidi el Mahdi, sheik, Arab religious leader of Islam, born in Bengazi in 1837; died in Kanem in July, 1902. His father, Sidi Mohammed, was a dervish of Algerian birth, a shérif, or descendant of the Prophet, who, after adventures and trials under Abdul Kader, went to Mecca, and then returned homeward through Egypt and Tripoli, settling in Cyrenaica near the border of his own district because he found it unsafe to reenter Algeria. He revived the pure doctrines of Islam among the Bedouins, and after some years migrated eastward to the small oasis of Jaghub. Senussi, left an orphan in infancy, was carefully educated by his father's disciples and encouraged to believe in his high calling as a guide of Islam. For fifty years he remained on the oasis, living a life of ascetic piety and preaching his doctrines among the desert tribes whose camels transport goods between the coast and the Soudan states of Wadai and Kanem. His reputation for holiness spread wherever caravans went, and in all the oases of the Sahara lived members and missionaries of his sect. In the end he left Bengazi to take up a wandering life in the Sahara among the tribes who were susceptible to religious fervor and ready to adopt his stringent rules of simple living. He had no political ambition, was loyal to the Sultan of Turkey as caliph, abstained from all intrigue, and kept no armed force. For some years he lived in the oasis of Borku. The Mahdi of the Egyptian Soudan endeavored in vain to gain his support. When he left Borku he moved by slow degrees with his large and increasing body of followers westward through the desert, spreading an elevating and refining influence among the fierce Bedouins and half-pagan Soudanese by his example and missionary teachings.

Siemeradski, Henryk, Russian painter, born in Kharkoff, 1844; died Aug. 22, 1902. He studied natural science at the University of Kharkoff, and afterward painting at the Art Academy at St. Petersburg; in 1871 went to Munich, where he imbibed the spirit of Piloty's historical school; settled finally in Rome; obtained the medal in the Russian section of the Paris Exposition of 1878 with his large painting of the *Torches of Nero*; exhibited later the *Amulet Seller*; *Vase or Slave*; *Out of the Catacombs*; *The Sword-Dance*; *Phryne*; *The Temptation of St. Anthony*; and designed frescoes for the Church of the Holy Saviour at Moscow.

Simar, Hubertus, German Roman Catholic prelate, born in Eupen in 1835; died in Cologne, May 24, 1902. He was educated at Bonn University and in the theological seminary at Munich. In 1864 he was appointed to the chair of Catholic Theology at Bonn, and in 1880 to that of Dogmatics and Apologetics. He took part in pastoral work and Church affairs during his professorship. He was intimate with the leaders of the Old Catholic movement until their severance from the

Church. In 1891 he was consecrated Bishop of Paderborn. His patriotic attitude during the conflict between the Government and the Curia was remembered when Archbishop Klementz died, in 1899, and a successor in the see of Cologne had to be found who was acceptable alike to the Government and the Curia. The King of Prussia placed him on the list of candidates, and the Cologne chapter elected him, but he would not accept without the behest of the Pope, who accordingly issued a formal command. When Dr. Simar took the oath of allegiance to the Emperor on Feb. 9, 1900, he added a declaration that he would act as a loyal patriotic German bishop.

Simpson, Maxwell, English chemist, born in Beech Hill, County Armagh, Ireland, March 15, 1815; died Feb. 26, 1902. He was graduated at Trinity College, Dublin, and subsequently as a bachelor of medicine in 1847. He became lecturer in chemistry, but tired of teaching, and went abroad to study chemistry with the masters of the science. In 1851 he worked under Kolb at Marbourg, then with Bunsen at Heidelberg. While in the latter's laboratory he published his first scientific memoir, *On Two New Methods for the Determination of Nitrogen in Organic and Inorganic Compounds*. He next went to Paris and entered the laboratory of Wurtz. While here he made original investigations and published many papers. In 1861 Prof. Frankland communicated a paper of his to the Royal Society, *On the Synthesis of Succinic and Pyrotartaric Acids*, which led to his subsequent election as a fellow of the Royal Society. In 1872 he was appointed to the chair of Chemistry in Queen's College, Cork. He resigned this professorship in 1891. He was examiner for several institutions in London and elsewhere, was an honorary fellow of the King's and Queen's College of Physicians, received the degrees of M. D. and LL. D. from the University of Dublin, the degree of D. Sc. from the Royal University of Ireland, was president of the chemical section of the British Association in 1878, and was vice-president of the Chemical Society from 1872 to 1874. The volumes of the *Journal of the Chemical Society* and the *Proceedings of the Royal Society* contain many of his memoirs.

Smith, George Vance, English Biblical scholar, born in Portarlinton, Ireland, in 1816; died in March, 1902. He was educated for the Unitarian ministry at Manchester New College, then situated at York, and was Professor of Theology there several years. He was minister of St. Saviour Gate Unitarian Chapel, at York, in 1858-'75, and principal of the Caermarthen Presbyterian (Unitarian) College, Wales, in 1876-'88. He became a member of the New Testament Revision Company in 1870, and served till the conclusion of the work. His invitation to this work excited the fiercest opposition in certain quarters, and in the opinion of some theologians the labors of the company were almost neutralized by the fact that a Unitarian had shared in them. His presence at communion in Westminster Abbey with the other revisers also gave rise to a display of theological bitterness. His published works include *The Prophecies relating to Nineveh and the Assyrians* (1857); *The Holy Scriptures of the Old Covenant in a New Translation* (1859); *Eternal Punishment* (1865); *The Bible and Popular Theology: A Restatement of Truths and Principles* (1871); *The Spirit and the Word of Christ and their Permanent Lessons* (1874); *The Holy Scriptures of the Old Covenant in a Revised Translation* (joint author) (1874); *The Prophets and their Interpreters* (1878); *Texts and Margins of the Revised New Testament* (1881); *Chapters*

on Job for Young Readers (1887); The Bible and its Theology as Popularly Taught, a revised and enlarged edition of The Bible and Popular Theology (1892); and Some Modern Phases of the Doctrine of the Atonement (1894).

Southward, John, English typographer, born in Liverpool, April 27, 1840; died in London, July 9, 1902. He was perhaps the highest English authority on the history of typography, and was widely known as a writer and lecturer on the subject. At seventeen he edited a local magazine, and he was subsequently editor of the Liverpool Observer, edited by his father. He removed to London in 1865, and in 1869 became editor of the Printer's Register. In 1891 he assumed proprietorship of the Paper and Printing Trades Journal, but soon relinquished the business in order to devote himself to the literature of his favorite theme. His valuable work on Practical Printing reached a third edition in 1887. Other important works by him are Fine Printing; Principles and Progress of Printing Machinery (1889); Type-Composing Machines of the Past, Present, and Future (1890); Modern Printing (1900); and Bibliography of Printing (in part).

Stark, Arthur James, English artist, born in Chelsea, England, Oct. 6, 1831; died in South Nutfield, Oct. 29, 1902. He studied painting under his father, John Stark, an artist of the Norwich school of colorists, who was frequently styled the English Hobbema, and profited so well by the instruction that at seventeen he exhibited his first canvas, A Water-Mill, at the Royal Academy. The Starks had removed to Windsor from Chelsea when the lad was about eight years old, and while living at Windsor he acquired that love for the valley of the Thames that was afterward to make itself so apparent in many beautiful landscapes. Stark entered the Royal Academy Schools in 1849, and from the year preceding till 1877 exhibited at the Academy almost without a break. His subjects were nearly always landscapes with cattle, and although an animal painter he was essentially the latest exponent of the Norwich school of painting, depicting nature in rich but quiet tones. After 1886 he lived and worked at South Nutfield, in the pleasant district in Surrey near Redhill.

Stephens, William Richard Wood, English clergyman, born in Gloucestershire, Oct. 5, 1839; died Dec. 22, 1902. He studied at Oxford, prepared for the Anglican ministry, and was ordained in 1864. He was curate of Staines, 1864-'66, and of Purley, Berkshire, 1866-'69; vicar of Mid-Lavant, Sussex, 1870-'73; and rector of Woolbeding, Sussex, 1876-'94. He was lecturer in the Chichester Theological College in 1872-'75, became a prebend of Chichester cathedral in 1875, and was promoted to the deanery of Winchester in 1894. His published books comprise Saint Chrysostom: His Life and Times (1872); Memorials of the South Saxon See and Cathedral Church of Chichester (1876); Christianity and Islam (1877); The Burials Question (1877); The South Saxon Diocese: Selsey-Chichester (1880); Hildebrand; His Life and Times (1888); Life and Letters of Edward Augustus Freeman, his most important work (1895); The English Church from the Norman Conquest to the Accession of Edward I, 1066-1202 (1901).

Sterndale, Robert Armitage, English civil servant, born in England, June 30, 1839; died Oct. 3, 1902. After being educated privately, he was sent to India in 1856 to fill an appointment in the financial department of the Government. He served in various capacities for many years, becoming accountant-general for Bombay in Janu-

ary, 1884, and accountant-general for Madras in November, 1887. Retiring from the Indian service in 1890, he subsequently served as Acting Governor of St. Helena for six months, and was appointed Governor in 1897, which office he filled at the time of his death. Gov. Sterndale was the author of Seoni, or Camp Life on the Satpuras: A Tale of Indian Adventure (1877); The Afghan Knife, a novel (1879); A Natural History of the Mammalia of British India and Ceylon (1884); Denizens of the Jungle (1887); Turkey and Ceylon; An Account of the District of Seoni; and Saint Helena (1902).

Stokes, John, English military engineer, born in Cobham, Kent, June 17, 1825; died in Ewell, Nov. 17, 1902. He was the son of a clergyman, was educated at Woolwich, entered the royal engineers in 1843, served in the two Kaffir wars with distinction, organizing the Hottentot levies in 1851, was chief engineer of the Turkish troops in the Crimean War, fortified Kertch, was British commissioner at the disbandment of the Turkish contingent after the war, was appointed British commissioner for the Danube in 1856 under the treaty of Paris making it an international stream, was nominated vice-consul at the Danube delta in 1861, signed the convention for regulating navigation at the mouths of the Danube in 1866, and the Danube loan convention in 1868, and remained until the work of deepening the Sulina mouth was completed at the end of 1871. For the next two years he commanded the engineers in South Wales, was British commissioner on the tonnage question in 1873 and was employed on other affairs connected with the Suez Canal, concluded a convention with M. de Lesseps in 1875, and has been the representative of the British Government on the Canal Board from the beginning. He retired from the army with the rank of lieutenant-general in 1887.

Sutherland, Alexander, Australian lecturer, born in Glasgow, Scotland, in 1852; died Aug. 9, 1902. After emigrating with his parents to New South Wales in 1867, he completed his education at Melbourne University. He was tutor at Morison's Scotch College, Melbourne, in 1871-'73, and then founded Carlton College in Melbourne, of which he was principal until 1892, when he withdrew and devoted himself to literature, although he continued to lecture. Near the end of his life he was appointed registrar of Melbourne University. With his brother George he published in 1879 a History of Australia and New Zealand, which proved very popular. Subsequent works of his are Thirty Short Poems (1880); The Development of Australian Literature (1898); and Origin and Growth of the Moral Instinct, his most important work (1898).

Targe, Allain, French statesman, born in 1832; died July 17, 1902. His father and grandfather were judges, and he was a deputy of the public prosecutor under Napoleon III until he resigned to join the republicans. He was unsuccessful as a candidate in Paris for the Corps Législatif in 1869. After the fall of the empire he was prefect at Angers and Bordeaux. He failed twice as a candidate for the Chamber, and then succeeded, in 1876, in getting elected for Paris. He opposed the Opportunists, and in 1885 became Minister of the Interior in the Brisson Cabinet. The successes of the Reactionaries through the *scrutin de liste*, for which Gambetta was responsible, were charged to his mismanagement of the elections, and therefore he was not taken into the Cabinet again after the fall of the Brisson ministry at the end of 1885, and in 1889 he lost his seat in the Chamber.

Temple, Frederick, Primate of all England and Metropolitan, born in Santa Maura, in the Ionian Islands, Nov. 30, 1821; died in London, Dec. 23, 1902. He was the son of an English army officer, who died while his son was still quite

young, and the boy was brought up by his mother, who was comparatively poor. He was sent to the famous Blundell school at Tiverton, and thence to Oxford, graduating in 1842 with a "double first-class," and thus securing a fellowship and tutorship in his college. He was ordained to the priesthood of the English Church in 1846, and was principal

of Kneller Hall, near Twickenham, from 1848 to 1858. After serving as school inspector for several years, he became head master of Rugby School in 1858, and under him the school regained much of the prestige it had held during Dr. Arnold's head-mastership. In 1860 the famous volume of *Essays and Reviews* appeared, exciting a vast amount of acrid controversy on account of the supposed unorthodox opinions of its various authors. Dr. Temple's own contribution to the volume, *The Education of the World*, was certainly not open to the objections urged against the others, but it encountered quite as much adverse criticism as they, and caused many persons to regard him as a heretic. When he was nominated to the bishopric of Exeter, in 1869, the most virulent objection to the appointment was developed among the clergy on account of his participation in the volume just named, but it was ineffectual, and he was consecrated in due course. In 1885 he was translated from Exeter to London, and again encountered opposition on account of the unforgotten contribution to the unorthodox *Essays and Reviews*. On the death of Archbishop Benson, in 1896, Dr. Temple was nominated to fill the vacancy, and on Dec. 22 of that year the nomination was confirmed in Saint Paul's Cathedral, and he was enthroned Archbishop of Canterbury in the following January, his death occurring at the completion of his sixth year as primate. But few objectors appeared on the occasion of his elevation to the primacy; and, although he was a Radical in politics, his promotion came to him at the hands of a Tory Prime Minister, the choice having been dictated, in some degree, at least, by Queen Victoria. As Archbishop of Canterbury he stood for sincere belief in the essentials of Christianity combined with extreme comprehensiveness in the Anglican fold, and no man in the kingdom commanded more general respect than he. He was brusque in manner, and a rigid disciplinarian both as head master and bishop; but his perfect sense of justice and his abundant common sense commanded a far-reaching influence. He was a total abstainer, both from temperament and conviction, and was a strong ally of the temperance cause; but he was never fanatical on the subject, being able always to discern the limits of practical attainment in the direction of reform, and on the stirring topic of public education his grasp of the

situation was equally apparent. He was a plain rather than a popular preacher, but, while he was easily comprehended by the uneducated, his scholarship remained unobscured. The absence of early culture and the privations of his boyhood in Devonshire left their mark upon him, as shown in certain provincialisms of speech and accent, and perhaps also in the excessive brusqueness that led some witty clergyman to remark, "There are no polished corners to our Temple." With a wonderful capacity for hard work, he was a stern economist of time, never wasting it upon mere superficials. On one occasion when he was Bishop of London, the visiting Emperor of Germany sent to request the prelate to call upon him. As compliance with the imperial demand involved the loss of practically an entire working day, he told the Emperor's messenger that he should be unable to do as had been requested. "But, my lord," exclaimed the horror-stricken man, "neither I nor anybody else ever conveyed such an answer to the Emperor of Germany." "I can not help that," said the bishop, "you must convey it now," and the desired call was not made. Although the term of Dr. Temple's primacy was short, it was eventful. Many important questions, civil and ecclesiastical, came before him for consideration, and in ritual and other controversies he held an even rein. He took part in the Queen's diamond jubilee in 1897, and in the celebration of the landing of Augustine at Canterbury, and to him fell the duty of crowning the present King of England, Edward VII. He married in 1876; and his wife, a granddaughter of the late Earl of Carlisle, and herself a tireless worker and organiser, survives him. His only published books are three volumes of sermons delivered in Rugby Chapel and his Bampton Lectures, delivered in 1884, on *The Relations between Religion and Science*, a work held in the highest esteem by competent critics. Despite his rugged appearance, his years of tireless activity had told upon him severely, and in his last months he was attacked by a species of ataxia, which manifested itself in August last at the moment of coronation. While about to place the crown upon the head of the King, he tottered and would have fallen but for the King's sustaining arm. An equally pathetic scene occurred in the House of Lords on Dec. 3, when, at the close of a vigorous speech in support of the public education bill, the aged primate sank upon his seat in collapse and had to be assisted from the chamber. On reaching Lambeth Palace he was conveyed to his bed, which he was too weak to leave afterward. On the following Saturday his funeral took place in the cathedral at Canterbury.

Temple, Sir Richard, English civil servant, born in Kempsey, near Worcester, England, in 1826; died in Hampstead, March 15, 1902. He was educated at Rugby and Haileybury College, and entered the East Indian civil service in 1846. After holding successively several important places of trust, he became Finance Minister of India in 1868, Governor-General of Bengal in 1874, and was Lieutenant-Governor of Bombay, 1877-'80. Returning to England, he served on the London School Board in 1884-'94, and sat in the House of Commons from 1885 to 1895. He traveled extensively on the Continent, and was an amateur artist. His published works include *India* in 1880 (1880); *Men and Events of my Time in India* (1882); *Oriental Experiences* (1883); *Cosmopolitan Essays* (1886); *Palestine Illustrated* (1888); *Life in Parliament* (1893); *The Story of my Life* (1896); *A Bird's-Eye View of Picturesque India* (1896); and *The House of Commons* (1900).

Thompson, D'Arcy Wentworth, Irish scholar, born in 1829; died in Galway, Ireland, Jan. 26, 1902. For more than forty years he was Professor of Greek in Queen's College, Galway. He was the author of *A Latin Grammar for Elementary Classes* (1857); *Ancient Leaves* (1862); *History and Philosophy of Story-Telling* (1863); *On History and Progress* (1863); *Day Dreams of a Philosopher* (1864); *Nursery Nonsense, or Rhymes without Reason* (1864); *Fun and Earnest, or Rhymes with Reason* (1865); *The Wit and Wisdom of the Athenian Drama* (1867); and *Way-side Thoughts* (1868).

Tiele, Cornelis Petrus, a Dutch theologian, born in Leyden, Holland, Dec. 16, 1830; died there, Jan. 14, 1902. He was educated for the ministry at the Remonstrant Seminary in Amsterdam, and after being pastor of the Remonstrant Church at Moordrecht from 1853 to 1856 became pastor of a similar church in Rotterdam. Here he soon attracted attention as a preacher and scholar, and when the Remonstrant Seminary was transferred to Leyden in 1873 he was appointed a professor. In 1877 he accepted the chair of History of Religion, in the University of Leyden, while retaining his post at the seminary. Prof. Tiele published *History of the Religions of Zarathustra* (1864); *Comparative History of the Religions of Egypt and Mesopotamia* (1869-'72), which was quickly translated into French, German, and English; *Outlines of the History of Religion* (1876); *Elements of the Science of Religion* (1897-'99); and *History of Religions* (1901).

Tissot, James, French painter, born in Nantes, Oct. 15, 1836; died at the Abbey of Buillon, Aug. 8, 1902. He was a pupil of Ingres in the *Ecole des Beaux-Arts*, studied under Lamothe, and, in

London, under Seymour Haden, became a finished draftsman, but rather feeble colorist of French classic traditions. In his earlier work his favorite subjects were types of female beauty, treated in a frivolous manner, that were striking and attractive. He exhibited *A Promenade in the Snow* in 1859, and *The Return of Faust and Marguerite* in

1861, which is in the Luxembourg. In 1863 he sent to the Salon *The Prodigal*; in 1864, *Two Sisters*; in 1865, *Spring*; in 1866, *A Girl at Church*; in 1867, *Confidence*; in 1868, the water-color *Melancholy*; in 1869, *A Widow*; in 1870, *A Girl in a Boat*. He produced etchings of English scenes and a series on *Parisian Women*, and illustrated a novel by De Goncourt and other books. Under the impulse of a sudden bereavement he went to Palestine and devoted six years to studying the scenery and places, atmosphere, skies, architecture, plants, animals, utensils, costumes, the daily life, customs, and manners, and the Semitic types to be found there. His purpose was to illustrate in pictures all the recorded incidents in the life of Jesus Christ. This he accomplished, retiring to the ruins of the old abbey in the Doubs in 1896 after he returned to France with innumerable sketches and studies, in 350 water-colors and an immense number of small-

er sketches and drawings. As the paintings were intended for reproduction, the freedom of artistic treatment was somewhat restrained, yet they constitute collectively a marvelous and original work of art in which the Biblical scenes are depicted with force and feeling, with an entire absence of the conventions and traditional sentiment of religious art, in their true environment. His exact and faithful impressions of Oriental life are realistic without loss of dignity and minute in ethnological and historical details without a lowering of artistic quality, while the action of the sacred story is powerfully rendered and the actors throughout the series consistently interpret his conception of their character and individuality. The paintings were reproduced by Lemercier in Paris under the title of *La Vie de notre Seigneur, Jésus-Christ*. Tissot was still working at Buillon when he died, painting the scenes and incidents of the Old Testament. His water-colors and pen-and-ink drawings of the life of Christ, 540 works in all, are in the gallery of the Brooklyn Institute of Art, having been purchased for \$60,000, the price set by the artist, who refused to allow the paintings to be sold separately.

Tisza, Koloman, Hungarian statesman, born in Grosswardein, Dec. 16, 1830; died in Budapest, March 23, 1902. He belonged to the noble Protestant family of Borosjeno in the county of Biharar, studied law, and obtained a post in the Ministry of Education in 1848, which he resigned as soon as the revolutionary storm burst, but did not identify himself with the revolution. He went abroad to study, returned to his father's place in Geasz, his part of the inheritance, and first took part in public affairs as the champion of Protestant autonomy in opposition to Count Leo Thun's patent of Sept. 1, 1859, for the regulation of the Protestant communions. This interference of the Austrian Government in a branch of Hungarian affairs that the Hungarians had always settled among themselves gave a fresh impetus to the constitutional idea and brought Koloman Tisza to the front as its advocate. When the prefect called to examine the correspondence that Tisza was holding with the proscribed agitators and asked him to show a specimen of the incendiary documents he handed out the imperial patent as the only one he possessed. When in October, 1860, absolute government in the Austrian Empire was relinquished in a decree recognizing constitutional and representative rights in the various historical states existing, the Magyar Liberals were inclined to accept for Hungary the liberties offered, as they exceeded the constitutional rights that practical politicians then hoped to obtain for Hungary. Tisza induced them to reject the whole scheme of provincial self-government and to stand firmly for the historical rights of Hungary as an independent state. Henceforth he was the acknowledged leader of the movement for the restoration of the Hungarian Constitution. When Parliament was reconvened in 1861 he was elected to the House of Deputies from the town of Debreczin and succeeded Count Ladislaus Teleky in the leadership of the Left Center, the constitutional party which opposed Francis Deak's conciliatory proposal to petition the Austrian Emperor for the restoration of the ancient liberties, holding it unsuitable to address the monarch until he should become the crowned constitutional King of Hungary. When Deak's petition was summarily rejected by the Vienna Government its author drew up a fresh address which presented the Hungarian demands so fully and unequivocally that Tisza accepted it as an adequate expression of the Magyar aspirations. This memorial voicing the unanimous opinion of the nation was an-

answered only by the dissolution of the Hungarian Parliament with the threat of military force in case of resistance. During the despotic *régime* that followed Tisza expounded the constitutional view in articles contributed to a political journal started by his friend Moritz Jokai, in which he unfolded a Liberal program for Hungary, including free trade with other nations and the removal of trammels from internal industry and commerce. When Parliament was again convoked toward the close of 1865 Koloman was elected again as member for Debreczin, and with M. K. Ghycsy he led the group that in 1861 would speak to Austria only through a parliamentary resolution. This minority party supported Deak as well as his own more numerous followers, and Tisza took a prominent part in the negotiations for an *Ausgleich* that were interrupted by the war of 1866 and were quickly completed when it was over. When constitutional government was at last established with Count Julius Andrássy at the head of the ministry Deak's followers became the Government majority and Tisza's the regular Opposition, which supported the Cabinet, however, in its vigorous repression of socialistic and agrarian agitation. Tisza's political influence was not dependent on the strength of his party, which waxed in 1869 and waned again in 1872. He declined several times to take an office in the Cabinet. When the Government fell into discredit in 1874 by reason of administrative mismanagement Tisza was invited to form a Cabinet, but declined until the country was ready to adopt the program of the Opposition, which Ghycsy and his immediate following had left. When the Government made concessions to the non-Magyar nationalities Tisza approved, but when the Nationalist demands still grew he was the first to call a halt and to recall public opinion to sentiments of Hungarian patriotism and national union. In 1875 the Government majority was split up, and a large section was inclined to accept the plans of financial and internal policy put forward by Tisza. The ministry therefore resigned, and the Wenckheim Cabinet was formed, with Tisza in the Ministry of the Interior as the controlling mind of the combined Deak and Tisza parties. Eight months later Baron Bela Wenckheim retired, and Tisza, on Oct. 17, 1875, became Prime Minister and remained at the head of the Government till March 12, 1890, at first as Minister of the Interior and in later years as Minister of Finance. He placed the disordered finances on a sound basis, reestablished the public credit, renewed the *Ausgleich* twice to the advantage of Hungary, and developed a railroad system so complete that only small additions have since been required. The strength and growth of Hungary has been largely due to his undisputed control of internal and financial affairs for many years, while foreign affairs were left to Count Julius Andrássy. After his resignation of the premiership he was still regarded for some time as the general directing the party policy and as chairman of the most important committees of the Chamber and the delegation he continued to shape legislation. He was elected to Parliament four times from Grosswardein, and was grieved at his defeat in 1901 by a member of the Kossuth party, after which he was returned from a Transylvanian town. From the time of his entrance into political life he conducted the temporal affairs of the Calvinist Church and was the champion of Protestant rights and as such the object of the persistent enmity of the Clericals.

Tucker, Henry William, English clergyman, born in Devonshire, England, in 1830; died in

Florence, Italy, Jan. 3, 1902. He was educated at Oxford, and after his ordination to the Anglican ministry in 1855 was successively curate at Chantry, Somerset, 1855-'56; West Buckland, Devonshire, 1856-'60; and Devoran, Cornwall, 1860-'65. He became an assistant secretary of the Society for the Propagation of the Gospel in Foreign Parts in 1865, and subsequently chief secretary. This post he held until his retirement in July, 1901. He was prebendary of St. Paul's Cathedral from 1881. He published Clerical Recreations (1864); Under His Banner, a popular missionary work (1872); and The English Church in Other Lands (1886).

Tyler, Thomas, English scholar, born about 1825; died in London Feb. 27, 1902. He received his education at the University of London. He was a contributor to periodicals, and published the following works: Jehovah, the Redeemer God; The Scriptural Interpretation of the Divine Name Jehovah; Some New Evidence as to the Date of Ecclesiastes (1872); Ecclesiastes: A Contribution to its Interpretation (1874); and The Philosophy of Hamlet (1874).

Vaughan, William, English Roman Catholic prelate, born in London, Feb. 4, 1814; died in Newton Abbot, Devonshire, Oct. 25, 1902. He was educated for the Roman priesthood at Stonyhurst College, Lancashire; Saint Acheul, France; and Oscott College, and was ordained priest in 1838. In 1845 he was appointed president of Saint Paul's College, Prior Park, Bath, which office he filled till his consecration as Bishop of Plymouth, in September, 1855. Bishop Vaughan had two brothers in the priesthood, one of whom died in 1883 as Archbishop of Sydney.

Vibert, Georges, French painter, born in 1830; died in Paris, July 28, 1902. He produced many spirited aquarelles and small canvases rich in color that were prized in France and the United States. The *Couvent sous l'Armes*; *Désespoir de Polichinelle*; *Coquelin en Mascarille*; and *L'Antichambre de Monseigneur* are some of the best known. He earned the cross of the Legion of Honor by bravery in the defense of Malmaison during the war of 1870 and was the author of a successful comedietta.

Virchow, Rudolf, German scientist, born in Schifelin, a small town near Stettin, Pomerania, Oct. 13, 1821; died in Berlin, Sept. 5, 1902. His parents were middle-class people, probably of Jewish descent. He attended the public school in his native town, and then entered the gymnasium of Cöslin. In 1839 he became a pupil at the Friedrich-Wilhelm Institute, a training-school for army medical officers, and among his fellow-students here was Helmholtz. He took his medical degree in 1843. In 1846 he succeeded Froriep at the Charité Hospital. About this time he founded, in collaboration with Reinhardt, the famous Archiv. In 1848, owing to the uncompromising way in which he criticized the authorities as the result of his investigation of an epidemic, he was forced to resign his place at the Charité. He was immediately called to the chair of Pathology at Würzburg, and accepted. As a result of his work here the famous Cellular Pathology was published in 1858. In 1856 the faculty of the University of Berlin petitioned for his recall, and in spite of bitter opposition he was finally recalled and remained in his old university for the rest of his life. Besides occupying the chair of Pathology in the university, he was ethnologist and anthropologist, archeologist, Egyptologist, and scientific politician to the city of Berlin. He was a member of the Municipal Council of the city for forty years, and of the Prussian Chamber from 1862 to 1878, where

Tucker, Henry William, 1858-1918, born in Devonshire, England, in 1858.

Florence, Italy, Jan. 3, 1902. He was educated at Oxford, and after his ordination as a deacon began his ministry in 1855 as success-
ful minister at Chantry, Somerset, 1856-57; at St. Andrew's, Devonshire, 1858-60; and Devonport, 1860-65. He became an assistant minister at the Society for the Propagation of the Gospel, Foreign Parts in 1860, and subsequently secretary. This post he held until 1870, when he returned to England. In July, 1901, he was prebendary of Exeter Cathedral from 1881. He published "The Church of England" (1864), "Under His Banner" (1870), "A Dictionary of the Bible" (1872), and "The History of the Other Lands" (1880).

Vaughan, William, English. Prelate, born in London, Feb. 4, 1831. Newton Abbot, Devonshire, Oct. 2, 1892. He was educated for the Roman priesthood at St. Albans College, England; Saint Ann's and Oscott colleges; and was ordained in 1855. In 1847 he was appointed presb. of Paul's College, Park, Bath, and filled till his consecration as Bishop in September, 1863. Bishop of the brothers in the West of England, and in 1883 as Archbishop of Sydney.

Vibert, Georges, French, born 1830; died in Paris, July 28, 1891; many spirit drawings and paintings in color that were prized in the United States. He, Couvent, and Poir de Polignac, Coquelin and L'Antichambre, Monseigneur, the best known. He earned the Cross of Honor by bravery in the defense during the war of 1870 and was a successful commander.

Virchow, Rudolf, German naturalist and physician, born at Schivelbein, a small town in Pomerania, Oct. 13, 1821; died in Berlin, Sept. 5, 1902. His parents were middle-class people, of Jewish descent. He attended his father's native town and then entered the gymnasium of Cöslin. In 1840 he became a pupil of Friedrich-Wilhelm Luschke, a famous army medical officer, among his students here was Henslow. He took his degree in 1843. In 1846 he succeeded the Charité Hospital. About this time, in collaboration with Reinhardt, he published the *Archiv*. In 1848, owing to the unrest in which he participated, the author of his investigation of an epidemic forced to resign his place at the Charité, he was immediately called to the chair of Anatomy at Würzburg and accepted. As a result of his researches here the famous Cellular Pathology was published in 1858. In 1860 the faculty of the University of Berlin petitioned for his removal, although after bitter opposition he was finally retained in his old university, for the next 20 years. Besides occupying the chair of Pathology, he was ethnologist and prehistoric archaeologist. Egyptologist, and sent expeditions to the city of Berlin. He was a member of the Municipal Council of the city for 10 years, and of the Prussian Chamber from 1862 to 1890.

Rudolf Simon

he was a leader of the Radical party. In 1880 he became a member of the imperial Reichstag. Owing largely to his work in introducing a system of drainage and sewage farms, Berlin is now one of the most healthful cities in Europe. He attracted students to his laboratory and lectures from all parts of the world. As an illustration of his original methods, at his anatomical and pathological demonstrations the specimens were placed under microscopes, which were sent round through the seats on a small trolley railroad, and could thus be closely examined by each student without any interference with the lecture. An important innovation made by him was in autopsical work, which had previously been usually limited to an examination of the diseased part or organ. He systematically examined the whole organism, and thus showed how wide-spread may be the effects of a local disease center. Perhaps his most famous scientific dictum was the now well-known *Omnis cellula e cellula*. He was essentially a pathological anatomist and histologist. In 1874 he became a member of the Royal Academy of Science of Berlin. He was a commander of the French Legion of Honor, a foreign associate of the French Academy of Sciences, and a foreign member of the British Royal Society. Physically he was short and spare—in later years with gray hair and piercing gray, spectacled eyes. His voice was rather thin and weak; but, despite this, his lectures were always well attended, his earnest manner and his logical, incisive reasoning more than counterbalancing the lack of oratory. "The first time I saw Virchow," says a writer in the London Times, "was at the great medical congress held in London in 1881. At the opening meeting the Prince of Wales and the Crown Prince of Germany were present. Sir James Paget was in the chair, supported by Sir William Jenner, and the front rows of seats on the platform were filled by men of the greatest eminence—Pasteur, Charcot, Huxley, Gull, Lister, and others. The Crown Prince came in rather late, and as he stepped across the platform to his seat by the Prince of Wales he stopped for a moment to shake hands warmly with a little gray man sitting in the front row. It was Virchow, who may, I think, truly be said to have been *primus inter pares*. It was entirely characteristic of him that when he entered himself, and was received with a great outburst of applause, he reversed the familiar story of the senior wrangler who came forward and bowed when the people rose on the entry of the Queen. It never occurred to Virchow that they were applauding him, and he looked about for the Prince of Wales. He was always the same, absolutely simple and devoid of self-consciousness." Last year, on his eightieth birthday, he received congratulatory addresses from all parts of the world at a scientific birthday party held at the Pathological Museum in Berlin. In behalf of the scientific bodies of England, Lord Lister said on that occasion: "All these bodies join in the recognition of your gigantic intellectual powers, in gratitude for the great benefits which you have conferred on humanity, and in admiration of your personal character, your absolute uprightness, the courage which has enabled you always to advocate what you believed to be the cause of truth, liberty, and justice, and the genial nature which has won for you the love of all who know you." Prof. Virchow's death was primarily due to a fall on Jan. 3, 1902, from an electric tram-car in the Leipziger Strasse, Berlin. He fell heavily, and fractured the femur at the hip. It was characteristic of him that he took a great interest in the pathology of his own case,

quite apart from its bearing on his recovery. He declared, it is said, that, owing to his age, no osseous union would take place between the broken ends of the bone, and was actually pleased when subsequent skiagrams showed that his prophecy was true. Virchow was once challenged by Bismarck because of the defeat of the Government on a navy vote, and he had the courage to decline the honor of being shot by the famous Prime Minister. On receiving news of Virchow's death, Dr. Guido Baccelli, the Italian Minister of Agriculture, sent the following appreciative message to Berlin: "Wherever, the whole world over, science and freedom, integrity and character, are held dear, the highest honor will be paid to the memory of Rudolf Virchow."

Walsh, William Pakenham, Anglican bishop, born in Mote Park, County Roscommon, Ireland, May 4, 1820; died July 30, 1902. He was educated at Trinity College, Dublin, ordained priest in 1844, appointed curate of various churches, and in 1872 canon of Christ Church, Dublin. He became Dean of Cashel in 1873 and was elected Bishop of Ossory, Ferns, and Leighlin in 1878. He was at one time tutor to the late Charles Stewart Parnell. He resigned his see, owing to old age, in 1897. Among his many published works are *The Moabite Stone* (1874); *The Forty Days of the Bible* (1874); *The Angel of the Lord* (1876); *Ancient Monuments and Holy Writ* (1878); *The Decalogue of Charity* (1882); *Echoes of Bible History* (1886); and *Voices of the Psalms* (1890).

Wernery, Henri, French-Swiss educator, born in 1859; died in October, 1902. He studied theology with a view to entering the Protestant ministry, but the breadth of his religious views interfered with his conscientious acceptance of a pastorate, and after teaching French in Constantinople and at the Protestant Gymnasium in Paris he was called to the chair of French Language and Literature in the Academy of Neuchâtel in 1889. A year later he was invited by the State Council of the Canton of Vaud to take the chair of French Literature in the University of Lausanne. His influence exerted in poems and essays on the *Littérature Romande*, appearing in various periodicals, was felt far beyond the bounds of the university. His latest writing was the *Forspiel* for the coming centenary of Canton Vaud in 1903.

Wigner, John Thomas, English Baptist clergyman, died in London, Oct. 22, 1902, in his ninety-first year. He was one of the best-known ministers in his denomination, twice filling the chair of the Baptist Union of Great Britain and Ireland. He prepared for the ministry at Stepney College, and began pastoral work in 1839; but as he had been engaged in preaching several years prior to that date, his ministry in reality extended over a period of seventy-two years, his longest pastorate having been at Lynn Regis. He also founded the Baptist church at Brockley, and was its pastor for a quarter-century. He was the author of several hymns, and edited the volume of *Psalms and Hymns* so widely used by English Baptists.

Wild, H. von, Swiss meteorologist, born in Uster, Dec. 17, 1833; died in Zurich, Sept. 5, 1902. He was director of the Central Meteorological Station at Bern in 1863-'65, director of the Russian meteorological service in 1868-'95, and president of the International Meteorological Committee in 1882-'92. He was the inventor of a wind-vane much used, and was editor of the *Russian Repertorium der Meteorologie*, and author of numerous works on meteorology and terrestrial magnetism, the best known of which is perhaps his *Temperatur-Verhältnisse des Russischen Reiches*.

Wiltshire, Thomas, English geologist, born about 1828; died in Blackheath, Kent, Oct. 28, 1902. He was educated at Cambridge, and after preparing for the Anglican ministry was ordered priest in 1852. He was lecturer on geology at King's College, London, in 1872-'81; assistant professor there, 1881-'91; and Professor of Geology and Mineralogy from 1891 till his retirement in 1895. Prof. Wiltshire was the author of *The Red Chalk of England* (1859); *The Ancient Flint Implements of Yorkshire* (1862); *The Chief Groups of the Cephalopoda* (1867); *The Red Chalk of Hunstanton* (1869); and *History of Coal* (1878).

Zola, Émile, French novelist, born in Paris, April 2, 1840; died there, Sept. 29, 1902. His father was an Italian civil engineer, who drifted into France and constructed a canal at Aix. He married in Paris Émilie Aubert, and after the birth of their son returned to Provence. He died in

1847, leaving his family in straitened circumstances. Through the aid of his maternal grandfather, Émile Zola was sent to school and college. In 1857 he followed his mother to Paris and obtained a scholarship at the Lycée Saint-Louis, but failed to get his degree. He already showed literary tastes and had written a comedy called *Enfances le Pion*. He began life as an employee of the Custom-House at the wharves on the Seine, on a salary so meager that he was barely able to support his mother and himself in two small rooms. Through a change of administration he lost his place, and his mother returned to live with friends in Provence. Zola removed to a garret and subsisted on chance employment through three years of the direst poverty. About the end of 1861 he obtained work as a packer of books in the publishing house of Hachette & Co., at a salary of \$20 a month. He then devoted all his leisure to writing verses, tales, and romances. This came to the knowledge of M. Hachette, who transferred him to the publishing department and raised his salary to \$40. In 1864 Zola published his first book, the *Contes à Ninon*. He also wrote articles for the *Petit Journal* and the *Vie Parisienne*. In January, 1866, he left Hachette's to devote himself entirely to literary work, and the next month became an editor on the *Événement* under Villemessant. His sympathy for realism in painting and literature began to attract attention. He knew the sufferings of the poor, and determined to describe their life as it was. *Thérèse Raquin*, *The Mysteries of Marseille*, and *Madeleine Féral* rapidly flowed from his pen. The last-named novel dealt with the question of heredity, and soon afterward he conceived the plan of making this subject the basis for a series dealing with successive generations of a family during the second empire. This was the famous *Rougon-Macquart* series. In 1869 he began to write the first volume, *La Fortune des Rougon*, which the *Siècle* began to print as a daily *feuilleton*. On May 30, 1870, Zola married Mlle. Alexandrine Gabrielle Meley, and two months later the Franco-German War interrupted his work. Dur-

ing its progress he narrowly escaped being buried in a Government office, having been nominated subprefect of Castelsarrasin, but Gambetta did not confirm his appointment. After the war Zola returned to Paris and took an apartment in Baignolles. The family was in great poverty, and he worked hard night and day, writing for the papers and acting as parliamentary reporter for the *Cloche*. He had arranged with Lacroix for the publication of the *Rougon-Macquart* series, but the war prevented this. Zola, therefore, on the recommendation of Théophile Gautier, addressed himself to Charpentier, offering to sell one novel yearly, of which the publisher was to have exclusive right of sale and reproduction for a period of ten years, in consideration of a payment of \$100 a month. Charpentier accepted, and then Zola began his great work with the tenacity of purpose and regularity which ever afterward characterized him, writing *La Fortune des Rougon*, *La Curée*, *Le Ventre de Paris*, *La Conquête de Plasans*, *La Faute de l'Abbé Mouret*, and *Son Excellence Eugène Rougon*, none of which had a very large sale. But in 1877 appeared *L'Assommoir*, which brought the author fame and fortune. Charpentier voluntarily canceled his contract with Zola and made him a present of \$4,000. With \$1,800 Zola bought a little villa at Médan, near Paris, and also removed to a better apartment in the Rue Saint-Georges. These novels were far from occupying his entire time. He dramatized *Thérèse Raquin*, and wrote two vaudevilles that did not succeed. It was only when he associated with himself a practical playwright, M. Busnach, that he was able to produce a successful play by dramatizing *L'Assommoir*, which was brought out at the Ambigu in 1879. He expounded his naturalistic theories in the *Messager d'Europe*, of St. Petersburg, and to defend realism on the stage became dramatic critic of the *Bien Public* and afterward of the *Voltaire*. He carried his theories into politics, publishing in 1879 a manifesto denouncing opportunism. In 1880 he went to the *Figaro*, where his articles were for many years a well-known feature. He became head of a sort of school, and attracted to himself young authors such as Guy de Maupassant, Paul Alexis, Henry Céard, Léon Hennique, and Huysmans. They used to meet at his country villa, and together they wrote the *Soirées de Médan*, each author contributing a story, that of Zola being called *L'Attaque du Moulin*, which afterward formed the subject of an opera. After *L'Assommoir* Zola continued the *Rougon-Macquart* series, writing *Une Page d'Amour*, *Nana*, *Pot-Bouille*, *Au Bonheur des Dames*, *La Joie de Vivre*, *Germinal*, *L'Œuvre*, *La Terre*, *Le Rêve*, *La Bête Humaine*, *L'Argent*, *La Débâcle*, and finally, in 1893, *Le Docteur Pascal*. The most striking of the 20 volumes are *Le Ventre de Paris*, describing the market life of the city; *L'Assommoir*—the "knocker-out"—so-called from the name he gave to a low *café* where the vile spirits distilled sent to their death the dregs of humanity; *Nana*, whose heroine sells herself into a life of splendid shame; *Germinal*, showing the brutalizing effect of incessant labor; and *La Débâcle*, describing the overthrow of the empire in the Franco-German War. His novels are like photographs, accurate portrayals of immoralities, and abound in crudities and indecencies shocking not only to refined taste, but to any one with the least moral sense. Perhaps in thus holding the mirror up to vice it was Zola's intention to expose its hideousness, but he never draws conclusions. He leaves that to the reader. With the growth of his fame, Zola, who had shunned public honors, became desirous

of them. In 1878 he affected to despise the decoration of the Legion of Honor, but ten years later accepted it. In 1891 he sought to become a member of the Société des Gens de Lettres, and was elected by acclamation and chosen its president, which office he held until 1895. He had early shown opposition to the French Academy, but in 1888 began to seek admission, and he presented himself as a candidate nineteen times, up to 1898, being always defeated by the more conservative members. In 1894 Zola began a trilogy on three cities: Lourdes, symbolizing the middle ages; Rome, standing for modern evolution; and Paris, the city of the future. Later he undertook another series, which he planned in England during a semivoluntary exile imposed by his advocacy of the cause of Capt. Dreyfus. Convinced of the condemned officer's innocence of the crime of treason, Zola took up his defense with his usual vigor and persistence. In an open letter to the President of the republic, published in the *Aurore*, Jan. 13, 1898, under the title *J'Accuse*, he boldly demanded a revision of the Dreyfus trial. The popular hatred against Zola was only second to that shown for Dreyfus himself. The Minister of War instituted proceedings, and Zola was sentenced to one year's imprisonment and a fine of \$600. The verdict was quashed on technical grounds, but on a new trial Zola was condemned as before. He allowed judgment to go by default, and fled to England. Afterward Esterhazy confessed to the authorship of the incriminating documents, Dreyfus was pardoned, and Zola returned to France. The Four Gospels, as he called his latest series, were entitled *Fécondité*, *Travail*, *Justice*, and *Vérité*, the last not being completed at the time of his death. He had spent the summer at Médan, and returned with his wife on Sept. 28 to his hotel in the Rue de Bruxelles, where he had been living since 1889, to prepare for a trip to Italy. The weather was cold, and he had a fire in a stove in his bedroom. The next morning M. and Mme. Zola were found asphyxiated by fumes from a defective chimney. Mme. Zola was revived, but all efforts to resuscitate the novelist failed. His body was embalmed and buried in the Montmartre Cemetery on Oct. 5. Of his principal novels there were published 2,332,000 copies, Zola receiving an average sum of 20 cents a volume, making a total of \$466,400. Rights on innumerable translations and collaborations brought his earnings up to about \$1,000,000. He was never extravagant, and at the time of his death had about \$400,000, all of which he bequeathed to his wife. The couple never had any children; but, as the result of a *liaison*, he left a son and daughter in whom Mme. Zola, with remarkable generosity, interested herself in spite of their illegitimacy.

OKLAHOMA. (See under UNITED STATES.)

OLD CATHOLICS. The fifth International and eleventh German Old Catholic Congress was held at Bonn, Aug. 5-8, Privy-Councillor Prof. von Schulte presiding. The four previous international congresses were held at Cologne in 1891, Lucerne in 1892, Rotterdam in 1894, and Vienna in 1897. In the present meeting the purpose of bringing various churches together was more emphasized than that of holding a formally ecclesiastical meeting. It was attended by Bishop Weber, of Bonn; the Bishop-elect of Austria (Dr. Cech); the Bishop of Salisbury; Archbishop Gul, of Utrecht; Principal Van Thiel, of Amersfoort Theological Seminary, Holland; and Bishop Kozlowski, of the Polish Catholic Church in the United States. No Oriental bishop was present.

The Protestant Episcopal Church in the United States was represented by Bishop Potter, of New York, on the first day of the meeting; and afterward, Bishop Potter being obliged to leave to meet other engagements, by the Rev. Dr. R. J. Nevin, of the American Episcopal Church in Rome. Of the members of the Reunion Conference held at Bonn in 1875, Bishop Potter, Dr. Nevin, Prof. Lias, of England, and Col. Kireef, of Russia, only were present. At a general reception given the members previous to the opening of the congress an address of welcome was delivered by Dr. von Schulte, in the name of the Old Catholic Congregation of Bonn. Bishop Weber spoke in response, and said that he was glad to see among them representatives of the German Evangelical Church. "All these different churches represented," he said, "are not yet outwardly one, but they have all come out of sympathy and interest in the spirit of peace, which is a symptom of the universal inward wish and striving after a uniform organization of Christendom." The congress sermon was preached by Bishop Weber, who also insisted upon the value, and even necessity, of the Old Catholic platform, in that it maintains the decrees of the first seven councils of the undivided Church. At a meeting of the bishops a detailed report of the present condition of the Old Catholic movement in America among emigrants from the Roman Catholic nations of Europe is understood to have been discussed. At the first general meeting of the congress greetings were read by Col. Kireef from the Metropolitan of St. Petersburg, the Proto-Presbyter Jenischew, a number of eminent scholars and archimandrites, and the Patriarch of Constantinople. At an evening meeting addresses were made by the heads of the several Old Catholic churches. Archbishop Gul gave a historical sketch of the condition of the Jansenist Church in Holland during the past two centuries; Bishop Kozlowski spoke of the growth of his diocese in Chicago, representing that his jurisdiction was accepted by more than 100,000 Polish souls; the Bishop-elect of Austria (whose consecration is delayed till a foundation can be raised for the episcopal salary, as is required by the Government) described the progress of Old Catholicism in Bohemia, to which about 7,000 souls had been added by the movement called "Los von Rom." The Protestant propaganda was richly provided with money, but the Old Catholics were hindered by the want of it. The Bishop of Salisbury spoke of the insular character of the Church of England, and the lesson it had to learn from the international character of the Old Catholic movement, and urged that advantage be taken of the openings for extension offered it in Austria and among the Poles in America. At the second day's session the Rev. Dr. Nevin, in behalf of Bishop Potter, of New York, presented the greetings and good-will of the House of Bishops of the Protestant Episcopal Church in the United States. A number of resolutions touching practical work were adopted; one dealing with the need of a union for mutual help among the Old Catholic churches (with special reference to the "Los von Rom" movement in Austria); one advising religious unions for the training of the young in the principles of Old Catholicism; and one affirming the need of a reconciliation between religion and science. A resolution offered by Bishop Weber and passed almost unanimously was to the effect that a reform of the Roman Catholic Church in a genuine Christian spirit working from within outward is, since July, 1870 (the date of the decree of papal

infallibility), no longer possible; that religious Catholicity, in distinction from the political ultramontaniam of the Roman Catholic Church, is organized in the Catholic churches of the Old Catholic Church in Holland, Switzerland, Austria, and Germany; and declaring, contrary to the movement currently designated "Reform-Katholicismus" and represented by Krause, Schell, Ehrhard, Wahrmund, and others, in favor of a return of the Old Catholics to papal obedience on the ground that the Old Catholics, if inside of the Roman Church, would hasten the reform toward which it was supposed to be beginning to stir—that separation from Rome is necessary in order to make an effective protest against ultramontaniam. A resolution introduced by Prof. von Schulte, president of the congress, declared that "it is the duty of every man who, according to his conscience, is opposed to the fundamental principles of ultramontaniam openly to recognize the bidding of his conscience and act according to it, because only so can the might of ultramontaniam be broken and come to be held an unholy thing both by the state and society"; and appealed to liberal Catholics who remain under the papal banner, non-Catholic liberals, and conservative Protestants who compromise with the papacy for political reasons, to recognize their grave responsibility for the power that ultramontaniam has come to wield in Germany. A letter was read from Bishop Herzog, of Switzerland, who was kept from the congress by illness.

The Old Catholics had in 1900 57 clergy and 13,079 communicants in Germany, between 30 and 40 parishes in Switzerland, 24 parishes and 16,885 members in Austria, and 21 parishes in Holland; they have a few churches in Italy, and are represented in Paris, France. Their growth in Austria has been rapid since 1899, having been aided by the withdrawal of considerable numbers of people from the Roman Catholic Church, under the influence of what is called the "Los von Rom," or away from Rome movement, the origin of which has been traced to the publication in 1898, by the Old Catholic priest, Anton Nittel, of Warrnsdorf, of a tract entitled *Cut Loose from the Pope and from Rome*, and to meetings called by him. Of about 27,000 persons who had joined in this revolt up to 1902, it was estimated that about one-third had joined the Old Catholic Church, and two-thirds the Lutheran and Reformed churches. Besides a few Old Catholic Churches proper in the United States, the Independent Polish Catholic churches under Bishop Kozlowski, having 33 ministers, 43 churches, and 42,850 members, are recognized by the Old Catholics of Europe. The Polish churches have also sought intercommunion with the Protestant Episcopal Church.

ONTARIO, a province of the Dominion of Canada; area, 222,000 square miles; population in 1901, 2,182,942. Capital, Toronto.

Government and Politics.—There was no change in the Government of Ontario in 1902 except the retirement of J. T. Garrow and W. Hartly from their posts as ministers without office. G. W. Ross was Premier and Treasurer; J. M. Gibson, Attorney-General; E. J. Davis, Commissioner of Crown Lands; F. R. Latchford, Commissioner of Public Works; J. R. Stratton, Provincial Secretary; R. Harcourt, Minister of Education; and John Dryden, Minister of Agriculture. The Speaker of the Assembly was F. E. A. Evan-turel. The House was opened on Jan. 7 by Lieut.-Gov. Sir Oliver Mowat, with a speech from the throne, of which the following are the significant passages:

"I congratulate you on the continued prosperity of the lumbering industry, which gives employment to so many of our people and from which such a large part of our revenue is derived. The permanent Crown forest reserves, amounting to over a million and a half acres, have been carefully protected during the past season, and no loss of any consequence from fires or other causes has occurred. Steps are being taken to further increase these reserves, in order, if possible, to establish a perpetual source of income from the forests of the province. The mining industry of Ontario is making steady and satisfactory progress. More capital and labor are now being employed in mining operations than at any previous time, and the output of the chief mineral products of the province is rapidly and steadily increasing in both quantity and value. The work of settling the agricultural lands of the Crown has been successfully prosecuted during the year. Extensive areas have been disposed of to actual settlers, most of whom are from southern Ontario. It is satisfactory to know that those who leave the older settlements of the province to obtain homesteads or employment in newer fields now realize that they can find unexcelled opportunities within our own boundaries.

"The adequate care and maintenance of the insane of our population still engages the attention of the Government. Additional accommodation for 150 patients has been furnished by the completion of the new asylum buildings at Cobourg. This will relieve, for the time being, the existing congestion of the asylums of the province; but I fear you will be again called upon, at no distant period, to consider the advisability of making further provision for accommodation of the increasing number of the afflicted class.

"I am glad to learn that very satisfactory progress has been made in the promotion of technical education, and that in several of our towns and cities special buildings and suitable equipment for the purpose have been generously provided, and also that the system of traveling libraries for the newer parts of the province, for which provision was made a year ago, has met with general approval.

"The compilation of the imperial statutes in force in the province of Ontario under the provisions of chapter iii, R. S. O., has been completed and embodied in what will constitute Volume III of the Revised Statutes.

"The year just closed has been one of very gratifying prosperity to the agricultural classes. The growth of the dairy interests of the province is especially noteworthy, and the marked success of the exhibitors of the province at the Pan-American Exposition evinces the intelligence with which agricultural operations of every kind are carried on within the province. The improvements made at the Agricultural College by the erection of a physical and biological laboratory, and the early completion of the Massey Library and Museum, will add greatly to the efficiency of the college, and place it among the first agricultural colleges of America. The legislation of last session for the encouragement of the beet-sugar industry is likely to produce the results desired. The experiments conducted by the Department of Agriculture conclusively show that the province is most favorably adapted to the growing of sugar-beets, and several companies are now preparing to undertake the work of sugar-production. The amendments to the factories act, requiring the owners of factory buildings to provide suitable fire-escapes, have greatly in-

creased the safety of the operatives and those connected with the mechanical industries of the province. The fishing industry has, during the year, been unusually prosperous. The work inaugurated last year of restocking the inland lakes and rivers will be continued during the approaching season."

After passing important measures dealing with the liquor question and increasing the representation in the Assembly of new districts in the northern part of the province, the Legislature was prorogued on March 17. The royal assent was given to 116 bills, including the following:

Respecting mortmain and the disposition of land for charitable uses.

To amend the manhood-suffrage registration act.

To amend the Ontario election act.

To authorize the construction of the Temiscamingue and Northern Ontario Railway.

The agricultural and arts amendment act.

To approve and confirm an agreement between the Commissioners for the Queen Victoria, Niagara Falls Park Company and the Canadian Niagara Power Company.

Respecting the imperial statutes relating to property and civil rights incorporated into the statute law of Ontario.

Respecting expert witnesses.

Further to amend the mechanics' and wage-earners' lien act.

To amend the act respecting councils of conciliation and of arbitration for settling industrial disputes.

To amend the marriage act.

To amend the joint-stock companies winding-up act.

Respecting the sale of intoxicating liquors.

To amend the public health act.

To amend the Ontario factories act.

To amend the San José scale act.

To amend the act respecting the barberry shrub.

To amend the Ontario game protection act.

To amend the separate schools act.

The General Elections.—After months of preliminary conflict and preparation on both sides, the elections for the Ontario Legislature took place on May 29, 1902. The campaign was opened at Newmarket by Premier Ross on April 4 in a most elaborate speech. "How many of the 2,000,000 people in Ontario," he asked, "had any substantial grievance against the Government? They had settled 150,000 people in New Ontario. Had any of them a grievance? They had spent \$10,000,000 for the development of our railway system, and were doing in New Ontario what had been done in older Ontario many years before, where they had assisted 38 railways, 2,219 miles in length. They had kept pace with the wants of the country in regard to public buildings, on which they had spent \$23,563,000 in the past thirty years. They had cared for the insane, the deaf and dumb, and the blind, and the expenditure in Ontario for charitable purposes was greater per head than in Great Britain or in any State of the Union. They had kept step with the progressive tendencies of the age in education, and with the agricultural wants of the people." He elaborated the details of useful legislation during the past three decades, and declared that the Conservative Opposition had opposed them all.

Mr. J. P. Whitney, the Opposition and Conservative leader, had been equally active. His policy was announced as including measures of law reform in the interest of the poorer litigant

and in favor of one final and conclusive provincial appeal; the development of New Ontario and a railway into the Temiscamingue country; grants to railways only for development or colonization, and subject to Government control of freight and passenger rates; encouragement to the refining of minerals within the province; disposition of timber areas in pulp-wood lands under competitive tender; increased grants for agricultural purposes, and especially for agricultural schools; cooperation with the Dominion Government in promoting facilities for food transportation; educational reform in the direction of improving the curriculum and character of public schools; condensation and revision of municipal laws; elimination of alleged corruption and fraud from election procedure. The following was the Government or Liberal policy as announced and summarized by its supporters:

1. Early settlement of the unoccupied lands of the province by colonization and by the projection of the railways into New Ontario.

2. Manufacture within the province, and so far as practical by Canadian labor, of the products of our forest and the smelting and refining of mineral products.

3. Increase of agricultural wealth by improved methods of husbandry, cold storage, and the production of beet-root sugar, and by reclaiming undrained lands.

4. Extension of trade with Great Britain in all natural products, but especially in cattle, horses, and dressed meats.

5. Disposal of forest wealth with a view to its perpetuation by reforestry, timber reserves, and parks.

6. Improvement of transportation by better construction of highways and removal of tolls.

7. Regulation of rates for passengers and freight on all railways subsidized by the province, and ultimate control of such railways at the option of the Legislature.

8. Application of public revenues for development of the province and relief of the taxpayers.

9. Revision from time to time of the laws governing the municipal and political institutions of the province and the improvement and enforcement of all laws affecting public morality.

10. Maintenance of the independence of the Legislative Assembly as the guardian of the constitutional rights of the province.

11. Application of sound principles of education to the course of instruction in all our schools and colleges.

There was no actual dissolution of the Legislature, which expired on March 29. The writs for a new election were then issued; the nominations were held on May 22, and one candidate (a Conservative) was elected by acclamation; and on May 29 the contest closed with results in some doubt. As finally accepted on May 31, the result was as follows: 98 seats in all, of which the Liberal Government had carried 50 and the Conservative Opposition 47, with one in doubt. Some changes took place in the courts, and on July 2 the Government had a majority of one. At the end of the year the majority stood at two or three, with several by-elections pending. According to figures compiled from the majorities in the constituencies, Mr. Whitney had a popular majority of the votes polled.

The Prohibition Referendum.—Aside from the general elections, the chief public event of the year in Ontario was the referendum. Varied resolutions were passed by temperance organizations and submitted to the Government. On Jan. 24 more than 1,000 men interested in the

liquor traffic visited the Parliament buildings and presented a vigorous protest to the Premier against the impending legislation referring the question of provincial prohibition to a vote of the people. James Haverson made the following statement in behalf of the delegation: "There was invested in the distilleries and breweries of the Dominion \$15,500,000; in the real estate of the retailers, \$38,000,000; in the stock and fixtures, \$21,000,000; making \$74,500,000 directly invested in the business. There was paid by the distillers and brewers to the farmers annually \$2,382,000, and to the transportation companies \$450,000; wages, \$1,200,000; other outgoings, \$1,012,000. The retailers paid \$10,500,000 in wages. There was an outgoing by the trade of nearly \$15,500,000 annually. There was in bond in the Dominion 14,000,000 gallons of spirits, which, with the duty upon them, represented \$26,500,000 alone. The province of Ontario last year derived in revenue from the liquor trade \$629,000, of which \$250,000 was paid to the municipalities. All the distilleries of the country were in this province, and the largest number of the breweries. The retail trade of Ontario was more than half that of the rest of the provinces put together. Not only the liquor trade would be affected, but the banks, the loan companies, and the financial institutions."

The Premier gave a simple promise of consideration. On Feb. 12 Mr. Ross presented his measure to the Legislature in an elaborate speech.

The majority for the measure at its second reading on March 6 was 13. Very few amendments were accepted, though the date was changed to Dec. 4, and the voting requirements were adapted to the general election of 1898, instead of that of 1902. The bill finally passed the House on March 15 with the same majority as above. Meanwhile, on Feb. 26, F. S. Spence presented to a Convention of the Dominion Alliance for the Prohibition of the Liquor Traffic resolutions from its executive declaring the conditions attached to the referendum to be "difficult, unjust, and unreasonable." On March 26 the same committee issued a manifesto urging popular work and support for prohibition.

The day previous to the election the papers published a document signed by a large number of business and professional men protesting against the measure as unwise and impracticable. The first returns on Dec. 5 indicated that a sufficient vote had not been obtained, as 213,507 were necessary to make the measure law. But as the incomplete returns came in the vote was shown to be much larger than expected, until on Dec. 27 95,992 votes in favor of prohibition were received. The total vote cast was 301,268.

Finances.—The Premier and Provincial Treasurer of Ontario delivered his third annual budget speech in the Legislature on Jan. 22, 1902. He took great credit to the Government for their saw-log legislation of 1890, by which the export of logs to United States mills for manufacture had been stopped, and he pointed out the benefits of their policy of setting apart forest reserves to the extent of about 2,500,000 acres. He said that since confederation in 1867 they had received \$3,814,588 interest on investments; that the Government had encouraged the railways of the province by adding 2,219 miles since 1871, at a total cost of \$10,058,942; that during the same period \$3,492,410 had been spent upon colonization roads, \$4,407,546 upon asylums, \$1,307,880 upon penal institutions, \$1,399,542 upon educational institutions, \$541,565 upon agricultural institutions, and \$1,502,682 upon the new Parlia-

ment buildings. With some minor sums, these items made a total of \$9,986,026 which had been spent upon public institutions and special interests. Turning to the actual receipts for the past year, the Treasurer said that they had exceeded the estimates by \$640,511. They were given as:

Balance in banks, Jan. 1, 1901, \$1,033,546; subsidy from Dominion, \$1,116,872; specific Dominion grant, \$80,000; interest due by Dominion Government, \$142,414; interest on investments, \$46,760; Crown Lands Department, including woods and forests, \$1,634,724; Algoma taxes, \$2,361; law stamps, \$55,747; licenses, \$76,372; Education Department, \$57,379; secretary's department, \$88,157; Fisheries Department, \$35,887; supplementary revenue act, \$237,506; succession duties, \$366,581; public institutions, \$97,735; casual revenues, \$92,655; miscellaneous, \$42,621; total, \$5,507,317.

The expenditures included \$281,135 upon civil government; \$134,138 upon legislation; \$416,042 upon administration of justice; \$782,193 upon education; \$833,163 upon public institutions' maintenance; \$4,825 upon immigration; \$209,858 upon agriculture; \$192,280 upon hospitals and charities; \$91,681 upon repairs and maintenance; \$194,607 upon public buildings; \$60,847 upon public works; \$138,801 upon colonization roads; \$179,008 upon charges of Crown lands; \$24,314 upon refunds; \$254,738 upon miscellaneous; \$7,097 upon drainage debentures purchased; \$96,209 upon railway aid certificates; \$102,900 upon annuity; \$25,281 upon the University of Toronto; \$9,706 upon common-school lands; a total of \$4,038,834. This, with a bank balance of \$1,468,492 on Dec. 31, 1901, made up the total of \$5,507,327. The estimated revenue for 1902 (excluding bank balances) was \$4,075,872, and the estimated expenditures \$4,004,228. The indebtedness of the province for annuities was \$2,908,150, and on railway aid certificates \$2,961,890. The Opposition, by adding to these latter figures various railway subsidies and other obligations said to exist, made out a total debt of \$12,769,000, and by other sums added to the year's expenses estimated a deficit in the current accounts of \$310,000.

Fisheries.—According to the latest published figures of the Dominion Department of Fisheries, the value of the capital invested in the lake fishing trade of Ontario was \$789,042 in 1900, and the men employed 2,502. Of the fish caught, and valued at \$1,330,293, trout figured at a valuation of \$531,854, whitefish \$216,054, herring \$163,560, pickerel \$130,280, sturgeon \$52,577, caviare \$45,380, and pike \$51,433. The report of F. R. Latchford for 1901 was dated Feb. 28, 1902, and said that licenses to fish with 2,410,627 fathoms of gill net and various other methods had been issued; that employment during the year was given to 2,802 men, 101 tugs, and 1,299 boats; that a capital estimated at \$749,071 was invested in the industry; that the aggregate catch was 27,428,375 pounds, and its estimated value \$1,428,078.

Crime and Lunacy.—The report of the Inspector of Prisons, etc., was presented to the Legislature on Feb. 15, 1902. He described some of the country jails as being in a bad condition, unsafe and unsanitary. Officials were excessive in numbers at some places, and deficient at others. The number of commitments in 1901 was 8,546, or fewer than in the previous year. There were 7,314 male prisoners, and 1,232 females. Two-thirds of these were intemperate, and one-third could not read or write. There were 41 deaths in the year, and 10 escapes, of whom 6 were recaptured.

As to lunatic asylums, the report of the inspector showed that on Sept. 30, 1901, there were 4,604 patients in the asylums of the province, compared with 3,318 in 1890. The question of the relative increase of insanity, compared with the population, the inspector declared to be very perplexing. While the provincial population had increased 56 per cent. in forty years, the number of insane and idiotic persons known had increased from 1,631 to 5,880, or 260 per cent.

Assessment Commission.—On Feb. 13, 1902, the commissioners appointed in the preceding year to investigate the condition and laws regarding assessments and municipal taxation in Ontario, made their final report. They went into the whole subject with some elaboration, and concluded that "in Ontario, as everywhere else, the direct taxation of personal property generally fails to reach the new kinds of property or wealth which modern civilization has produced." The existing taxes should be abolished, and the only feasible substitutes were thought to be (1) an improved and more general tax, and (2) a tax on the occupiers of land, based on its rental value. Single tax was not only too radical, but it was impossible as well as unprecedented. Various recommendations were made, and a bill was submitted for the Government to utilize, but nothing was done in the matter.

Forestry and Pulp-Wood.—The annual report on forestry in Ontario was published under date of Jan. 24, 1902. Statistics were given of the acreage in each county. The total showed 365,127 acres of woodland, compared with 425,781 in 1896. The experience and legislation of the United States in regard to reforestation were then described, and further action in Ontario was urged. The question of pulp-wood concessions in the forests of northern Ontario was a prominent political question. The Government asserted that these grants of territory, or rather of certain rights and privileges on the territory, were given under safe conditions and solely for purposes of development. The Opposition asserted that they were really grants of public property to enrich friends of the Government at the expense of the people. The area of the seven concessions was 15,660 square miles.

Mines.—Steady progress was shown in the development of the mining interests of Ontario in 1901-'02. On March 4 of the latter year the official report of the Bureau of Mines, prepared by Thomas W. Gibson, director, was submitted, and it was made public in August. The total production of the four years preceding Jan. 1, 1902, was as follows: 1898, \$7,235,877; 1899, \$8,416,673; 1900, \$9,298,624; 1901, \$11,831,086. In 1901, therefore, the total production showed an increase of \$4,595,209 in value over that of 1898, while the metallic products increased by \$3,327,732. Of this latter output in 1901, copper contributed 11 per cent., nickel 37, and pig-iron 33 per cent. Gold, silver, iron ore, and steel were small in comparison. The number of such concerns incorporated in 1901 was 47, with a nominal capital of \$27,716,000, while 13 companies of foreign origin took out licenses to sell stock and hold real estate in the province, with a nominal capital of \$12,250,000. Mr. Gibson made the following comment: "It is a somewhat remarkable fact that metalliferous mining in this province is almost wholly carried on by companies whose share capital is in the hands of people living in Great Britain or the United States. In nickel and copper this is true without exception; in gold it is all but true, and so also in iron."

The lead in progress was taken by the copper-

nickel industry. The yield of nickel ore for the year amounted to 8,882,000 pounds, or 4,441 tons, valued in the matte at \$1,859,970. This was an increase in quantity of 25 per cent., and in value of 145 per cent. compared with 1900. The copper contents of the matte were 4,197 tons, valued at \$589,080, compared with 3,364 tons, worth \$319,681, in 1901.

The iron industry occupied the second place in importance, and the progress was very marked. This was principally owing to the extensive development of the Helen Mine in Michipicoten, from which most of the ore now raised is taken. In 1901 the amount of ore produced was 273,532 tons, worth \$174,428, which was more than three times the quantity mined in 1900. The output of pig-iron was largely augmented both in value and quantity. In 1900 62,385 tons were got out, valued at \$936,066, while in 1901 the output was 116,370 tons, of the value of \$1,701,703.

There was a continuous decrease in the gold product. Only 9 mines were producing gold, against 18 the previous year. Their output was 14,293 ounces, worth \$244,443. The silver-mines yielded 151,400 ounces, valued at \$82,830, against 160,162, valued at \$96,367, the year previous. The only zinc-mine in operation yielded \$15,000 worth of ore, or 1,500 tons.

Petroleum products showed a decline, the yield of 1901 having a value of \$1,467,940.

Agriculture.—The creameries in Ontario at the end of 1901 numbered 286, with a production of butter valued at \$1,798,264, against 308 and a production of \$1,819,290 in 1900. The average wages of farm-laborers, according to the annual report of the Bureau of Industries for 1901, was \$165 a year, with board, in yearly engagements, and \$263 a year without board. By the month wages were \$17.78 in the working season with board, and \$27.05 without. Domestic servants averaged \$6.90 a month. The areas of assessed land in the province in 1901 was 23,636,178 acres, of which 13,436,482 were cleared, 6,715,872 were woodland, and 3,483,824 acres were swamp, marsh, or waste land. The crops for 1902 were as follows: Fall wheat, 20,033,669 bushels, yield per acre 26.8; spring wheat, 6,048,024 bushels, per acre 20; barley, 21,890,602 bushels, per acre 33.1; oats, 106,431,439 bushels, per acre 42.6; peas, 7,664,679 bushels, per acre 14.4; beans, 670,633 bushels, per acre 12.4; rye, 3,509,332 bushels, per acre 18.5; buckwheat, 1,911,683 bushels, per acre 20.5; potatoes, 12,942,502 bushels, per acre 89; carrots, 3,277,161 bushels, per acre 374; mangel-wurzels, 39,140,924 bushels, per acre 511; turnips, 71,740,204 bushels, per acre 525; corn for husking (in the ear), 20,512,194 bushels, per acre 55.1; hay and clover, 4,955,438 tons, per acre 1.87. There were 2,777,983 acres of pasture land in the province in 1901; 346,915 acres of orchard and garden, 12,227 acres of vineyard, and 677,935 apple-trees of fifteen years and over, producing 14,430,650 bushels of apples. The cattle on July 1 numbered 2,507,620, and were worth \$59,527,119. Those sold or slaughtered in the year numbered 610,880, valued at \$20,286,936. The sheep numbered 1,761,799, worth \$7,772,793. Those sold or slaughtered in the year numbered 729,148, worth \$3,103,513. The hogs numbered 1,491,885, and were valued at \$9,298,712. Those sold or slaughtered in the year numbered 1,973,405, valued at \$17,548,490. The poultry numbered 9,745,236, valued at \$2,859,172. Those sold or killed in the year were valued at \$1,305,555. The value of the wool-clip was \$781,769, and the product of bees in the province was worth \$1,111,099.

OREGON. (See under UNITED STATES.)

Amir Khan Sipahsalar; Minister of the Interior, Dabir el Mulk; Minister of the Treasury, Mushir es Sultaneh; Minister of Agriculture and Domains, Nassir es Sultaneh; Minister of Justice, Gholam Hussein Khan; Minister of Posts, Mirza Mohsin Khan; Minister of Telegraphs, Mukhbir ed Dowleh; Minister of Public Instruction, Neyer el Mulk; Minister of Mines, Mukandis el Mamaalik; Minister of Commerce and Religious Endowments, Kayam Makam. The system of government is that of an absolute Oriental monarchy, controlled only by occasional religious influences and popular outbreaks against intolerable wrongs. The Shah delegates his despotic powers to his ministers and to provincial governors, who transmit it to their underlings, to whom they sell their offices with the understanding that the prices paid will be exacted from those lower down in the scale, and in the last instance from the people. Whenever the superiors wish to raise more money they need only threaten to remove those below them in order to extract fresh gifts as the price of continuance in office. Justice, both in the courts of the Urf, or civil law, and those of the Shari, or ecclesiastical law, is bought and sold.

Area and Population.—The estimated area of Persia is 628,000 square miles. The population is estimated at 9,000,000. The empire is divided into 33 provinces of various sizes, each of which is under a governor-general. Of the population about 8,000,000 are Shiite Mohammedans, 45,000 Armenians, 35,000 Jews, 25,000 Nestorians, and 9,000 Parsis.

Finances.—The revenues belong to the Shah's treasury, and after payment of the expenses of the court, the army, the general administration, the colleges, contributions to poor provinces, and pensions and allowances to princes and members of the royal Kajar tribe, there formerly remained a considerable surplus to be added each year to the royal treasure. The fall in the price of silver reduced the revenues proportionately; consequently the present Shah can accumulate no hoard, and his fortune consists principally of what is left of the jewels collected by his ancestors, which at his accession were believed to be worth \$15,000,000. The savings of the late Shah alone were at one time not less than \$20,000,000. The total present annual revenue is estimated at 75,000,000 kranas, equivalent to \$7,500,000. About 15 per cent. of the revenue is derived from customs, 3 per cent. from posts and telegraphs, fisheries, mines, and other concessions, and 82 per cent. from taxes assessed on towns, villages, and districts. The expenditure on the army amounts to 18,000,000 kranas. For local government 2,600,000 kranas are allowed, and out of this sum comes the only expenditure on public works. The useful expenditure for the public services forms a small fraction of the total expenditure, most of which is absorbed by rapacious officials who do not work, and who get no regular salaries, but enrich themselves and those above them by the official perquisites that ancient custom enables them to obtain. Whenever a province revolts against the exactions of its governor and his subordinates and lapses into anarchy these officials are dismissed in disgrace and one of the masterful men in the official hierarchy is sent as governor to restore order in the turbulent province by whatever tyrannical methods he finds necessary to employ. Such strong governors are the ones who win the approbation, not only of the Shah, but of the people they rule over, since these prefer strong rule to the chaotic conditions that result when authority

is in feeble hands. The Persian public revenue has declined 25 per cent. since 1877. The value of the silver kran has fallen nearly 50 per cent. since 1884, and the further fall in 1902 caused a commercial and economic crisis. The rise in the prices of tea, sugar, cotton goods, and other imported necessities and native foodstuffs, which powerful officials and large landowners have manipulated for their own benefit, has doubled the cost of living in twenty years.

The existing public debt consists of loans obtained by the Shah since 1900 from a Russian banking corporation created for the purpose of financing Persian loans. The first loan, made in January, 1900, was 22,500,000 rubles. This debt, which pays 5 per cent., is secured on custom-house receipts, except those of Fars and the Persian Gulf, and has the guarantee of the Russian Government. A loan of £500,000 obtained from an English banking concern in 1892 was paid off from the proceeds of the Russian loan, and the Persian Government agreed to conclude no new foreign loan without the consent of the Russian bank, which in 1901 made another loan to the Persian Government of the nominal amount of 12,000,000 rubles on the like condition that Persia contract no loans with any other power than Russia before 1912. A fresh loan of 20,000,000 rubles was negotiated with the Russian bank in 1902. The Shah and his ministers have been spending, with the aid of the Russian loans, twice the present diminished revenue of the country, and the greater part of the expenditure has been sheer prodigal waste. His two journeys to Europe are believed to have cost \$1,500,000, and this part of his expenditure has been most resented by his people.

The Army.—The Persian army numbers 80,000 officers and men. It is badly armed with miscellaneous rifles, ill-fed and clothed, and irregularly paid, except the Persian Cossack brigade, about 2,000 strong, consisting of 4 regiments of cavalry and 2 battalions of field-artillery, thoroughly trained and disciplined and permanently commanded by Russian officers. The headquarters of this force are in Teheran, and it acts practically as the Shah's guard, which secured his peaceable succession to the throne and is employed for the suppression of riot or rebellion occurring in any Persian city.

Commerce and Production.—Persia produces wheat and barley, rice, fruits, opium, silk, wool, gum tragacanth and other gums, carpets, cotton, tobacco, pearls, and turquoises and other precious stones. Among the minerals are copper, lead, iron, zinc, tin, orpiment, ocher, cobalt, antimony, salt, coal, petroleum, and alum. The imports are cotton and woolen fabrics, glass, carriages, sugar, tea, coffee, petroleum, and drugs. The chief exports are dried fruits, opium, cotton, wool, silk, carpets, pearls, and turquoises. The customs duties, formerly farmed out, are now collected by Government officers. European merchants since 1828 have paid a uniform duty of 5 per cent. on imports and exports. Persians formerly paid from 1½ to 8 per cent. at the frontier and various transit and road duties in the interior; but on April 7, 1901, these internal barriers were abolished and the customs duties were made the same as for foreigners. The collection of customs by the Government was first tried in Azerbaidjan and Kermanshah in 1899, and in the following year was extended to the whole of the empire excepting the districts of Muhamrah, the Karum river, Kurdistan, Sistan, and the minor ports on the Persian Gulf. The values in pounds sterling of imports from and exports to different

countries in 1901 as reported by the Persian custom-house were as follow:

COUNTRIES.	Imports.	Exports.
Russia.....	£2,858,000	\$1,048,000
Great Britain.....	1,400,000	1,980,000
Turkey.....	285,000	458,000
France.....	272,000	428,000
Austria.....	300,000	200,000
China and Japan.....	40,000	808,000
Afghanistan.....	28,000	46,000
Germany.....	24,000	24,000
Other countries.....	50,000	90,000
Total.....	£5,107,000	\$2,898,000

The total commerce that passed through the custom-house was according to these returns £8,000,000 sterling, and that of the excepted districts is estimated at £600,000. The trade of the customs stations which have not yet been transferred to the European officials lent by the Belgian Government is not included in these figures, nor are the large exports of pearls from the fisheries of the Persian Gulf, nor the mysterious flow of silver from Persia into Afghanistan and Russian Central Asia, nor the imports of silver for the Persian mint and of Persian coins minted recently in Russia. Although imports have increased, exports have declined. The disparity is growing greater and is due not only to the large loans contracted by the Shah in Russia but to the consumption of the savings accumulated during the peaceful and prosperous early period of the last reign. There are many indications showing that the people, as well as the court and officials, are becoming impoverished. The process has gone on since silver begun to decline, and the court has at the same time grown more extravagant. Nasreddin in the last ten years of his reign squandered half the treasure he had accumulated in the previous forty years. The remainder has been spent by the present Shah.

In 1900, as estimated from the amount paid into the treasury by farmers of customs, which was assumed to be 80 per cent. of the duties collected, while these were supposed to average 4 per cent. ad valorem, the total trade of the country was calculated at £10,500,000. In the ports of Bushire, Lingah, Bunder Abbas, and Mohammerah, on the Persian Gulf, there were £809,449 imported from India in 1900, £506,226 of exports to India and £903,854 of imports from and £176,120 of exports to Great Britain. The tonnage entered and cleared at these ports was 1,025,363, of which 896,414 tons were British. Russian exports to Persia are encouraged by special rates on Russian railroads amounting to a bounty of 15 or 20 per cent. ad valorem. The duty collected on imports is fixed by the Russian treaty of 1828 at 5 per cent. ad valorem, and other nations have an equal advantage with Russia under the favored-nation clause, with the exception of Turkey, which has special arrangements of a less liberal character.

Railroads, Posts, and Telegraphs.—The only existing railroad is one 6 miles long between Teheran and Shah Abdul Azim, built by a Belgian company in 1888.

The postal service was farmed out until in March, 1901, it was made a Government department. The net revenue from posts in 1902 was expected to be about £8,000.

There are 4,800 miles of telegraph-line, with 7,000 miles of wire. The Persian Government has 3,700 miles of wire. The British Government has a staff which by virtue of conventions made in 1868 and 1872 operates 675 miles of line with 2,025 miles of wire, forming part of the overland

Indo-European line. Another part of this system, consisting of 415 miles of line, with 1,245 miles of wire, belongs to the Indo-European Telegraph Company. The line of the British Government earned £111,867 in 1900, and the company's line £164,926. In August, 1901, the British Government obtained a new convention allowing it to build a line 900 miles long, with 2,700 miles of wire, from British Baluchistan to Kashan. The Persian Government is constructing a line connecting Tabriz with the northwestern frontier and one 300 miles long from Meshed to Sistan.

There is a British Imperial Bank which has the sole privilege of issuing bank-notes, but its business has contracted owing to the competition of the new Russo-Persian Discount Bank, and the only Government business it obtains is the transmission to Teheran of customs revenue collected in districts where the Russian bank has no branches. The value of Russian trade with Persia has increased 125 per cent. since 1889, while trade with the British Empire has decreased 33 per cent. In the north Russian cotton goods and other manufactures have driven out British imports. In 1902 exports of cottons from England to Persia were 40 per cent. less than in 1901. The Persian customs service has been reorganized by a staff of Belgian officials, increasing the revenue, which was formerly farmed out to favored Persian officials, over 66 per cent. The treaty rate of 5 per cent. was often lowered by rebates offered by some of these officials, who by this expedient attracted a larger share of the trade to their own ports. The Belgians have collected a uniform 5 per cent. and have abolished internal *octrois* and transit duties, which were exacted from Persian merchants only, foreigners being exempt by treaty. The yield of customs in 1901 was 1,600,000 tomans, nearly equal to \$1,600,000, two-thirds of which is absorbed by the interest and sinking-fund of the two first Russian loans. Negotiations are going on with Russia for an increase of the general tariff by the substitution of specific duties ranging from 7 to 10 per cent. for the 5-per-cent. ad valorem rate. The Turkish treaty will also be revised, so that foreign nations can not claim under it more favorable rates than those established in the new Russian treaty. The growing British trade by the Karun river route from the Gulf of Persia was checked in 1902 by the closing of the custom-houses at Shuster and Ahwaz, compelling merchants to clear all goods at Mohammerah.

The cheap fabrics of European factories have in Persia, as in other Asiatic countries, caused the once flourishing manual industries of the towns to languish. The hand-loom silks, satins, and cotton and woolen stuffs, the copper vessels, the pottery, tiles, and other products of industrial art, excepting rugs, shawls, and such other articles as find a foreign market, are made in diminishing quantities and the old arts are passing into oblivion. Agriculture, too, is decaying. Although the farming population is exceedingly laborious and skilled in cultivation, with the aid of underground aqueducts by which the slender water-supply is distributed over the largest possible area, the land is passing into the possession of rich officials, who have it in their power to divert the sources of the water, and thus can buy at their own price the land of small owners and exact from their tenants the maximum share of the produce.

Political Affairs.—The foreign debts contracted by the court, for which the revenues have

been pledged without any visible benefit to the country in the shape of roads and bridges or irrigation canals, have caused wide-spread popular discontent. One of the manifestations of this is a revival of Babism in a socialistic and agrarian form. The Atabeg Azam, Mirza Ali Ashgar Khan, is the object of the manifestations of disaffection, rather than the Shah, who is regarded from his yielding and good-natured disposition to be as wax in the hands of his able and resourceful Vizier, who in spite of his ascendancy over the Shah was replaced by the Amin ed Dauleh early in 1897, and only recalled to power in the middle of 1898. The turbulent spirit shown by

nations, since they must pay Russian import and export duties in goods destined for or coming from Persia or central Asia. In the Persian Gulf the Russians have attempted to build up a trade by subsidizing steamers plying between its ports and Odessa. The road from the Caspian port of Reshd to Teheran, the only good one in Persia, was built with Russian capital, and Russian goods that are brought over it now undersell British goods in central Persia as far as Isfahan. Two other Russian-built roads tap other parts of north Persia. A concession for a road from the Caucasian frontier through Tabriz to Kasbin was given for the loan of 1901,

BRIDGE AT ISFAHAN.

the people of Shiraz in 1902 caused the Governor residing in that city, who was the Shua es Saltaneh, the second son of the Shah, to be recalled. The Amin ed Dauleh when he took office announced a comprehensive scheme of administrative reform, including a revision of the land tax, the reduction of the standing army to 20,000 men, the conversion of the irregular cavalry into a gendarmerie, separate administrations for the collection and the expenditure of revenue, and the framing and publication of annual budgets setting forth the revenue and expenditure of the Government. Before he was dismissed he introduced a nickel coinage and started a number of schools with the aid of private subscriptions. Some of the minor features of his program have been carried out by his successor, though the program as a whole was discarded. The Shah in May, 1902, accompanied by his Grand Vizier, made his second journey to Europe, visiting the heads of the important states and not returning to his capital till October. Abul Fath Mirsa, the Salar ed Dauleh, the third son of the Shah, twenty years old, was appointed regent during the Shah's absence.

The governments both of Great Britain and of Russia declared in 1884 their policy in Persia to be the maintenance of its independence and integrity and an open door for trade throughout the empire. These declarations have been repeatedly renewed. The open door to British trade in northern Persia which existed when Kars and Batum were Turkish ports has been closed by Russia, which imposes protective duties on foreign goods though they are in transit for Persia. All flags except the Russian have been shut out from the Caspian Sea. Batum, which Russia undertook in the treaty of Berlin to make a free port essentially commercial, has become a great port for Russian commerce, but not free to other

and for the latest loan one for a road from Tabriz to Teheran. Russian political influence at Teheran has to some extent baffled the British schemes for opening commercial routes from the southern ports into the heart of Persia. The British, however, are still commercially supreme in the south, and they have opened an overland trade route from India through Baluchistan, the Quetta-Nushki route, with a view of retaining a part of the trade of the northern provinces. In five years the traffic on this road has risen from 500,000 rupees to 1,600,000 rupees. British vessels of war have for a long period patrolled the Persian Gulf, which was infested with pirates until Great Britain undertook this police duty. The ascendancy of Great Britain in the Persian Gulf was stated by the spokesman of the Foreign Office in the House of Commons to be the foundation of British policy. A naval base in these waters in the possession of another power would flank the ocean route to India and the far East and to Australia. The British Government in 1902 obtained the right to build a new telegraph-line from Baluchistan across Persia to Kashan. An Australian capitalist obtained a concession of the right to work the petroleum wells of the Kerkhah valley and to lay a pipe-line to tidewater. The oil-fields in southwestern Persia begin in the district between Bagdad and Kermanshah that is in dispute between Persia and Turkey. Russian diplomacy induced the Persian Government to defer for ten years the construction of railroads or the granting of any concession for that purpose either to Persians or to foreigners. The British Government subsequently obtained an agreement that whenever railroad construction should begin British capital and enterprise would have as good opportunities as are extended to any foreigners. At Robat, the station on the Persian border of the caravan route opened

through Baluchistan, the Indian troops sent to guard the road occupied two posts in Seistan. Mirza Mahmud Khan, Governor of Kirman, went with a Persian force to the spot, and arranged with the British commander that the Anglo-Indian troops should withdraw from Mirza, which is undoubtedly Persian. The garrison at Robat, the other disputed place, was allowed to remain, the boundary at that point not being clearly defined.

PERU, a republic in South America. The Congress consists of a Senate of 48 and a House of Representatives of 108 members. Members of both houses are elected for six years by electoral colleges, the delegates to which are elected in each province by parochial electoral colleges. The President and Vice-Presidents are elected for four years by the direct vote of the nation. The President of the Republic for the term beginning Sept. 8, 1899, is Eduardo de Romaña. The Vice-Presidents are Dr. Isaac Alzamora and Federico Bressani. The Cabinet constituted Sept. 13, 1901, was composed as follows: President of the Council and Minister of Foreign Affairs, Cesares Chalcatana; Minister of Justice, Worship, and Public Instruction, Lizardo Alzamora; Minister of the Interior and Police, Leonidas Cardenas; Minister of War and Marine, Capt. Meliton Carvajal; Minister of Finance, Andreas Ward; Minister of Public Works, Señor Eug. A new ministry was formed on Aug. 10, 1902, as follows: Prime Minister and Minister of the Interior, Alejandro de Ustua; Minister of War and Marine, Col. Diez Canseco; Minister of Justice, Dr. José Aria; Minister of Finance, José Reinoso; Minister of Public Works, Teodoro Elmore.

Area and Population.—The area of Peru is 695,733 square miles. The population in 1896 was 4,609,999, not counting uncivilized Indians, of whose numbers no estimate can be formed. Of the population less than 14 per cent. are white, 2 per cent. negroes, 2 per cent. Asiatics, 58 per cent. Indians, and 24 per cent. mestizos, both Cholos and Zambos. Lima, the capital, has above 100,000 inhabitants.

Finances.—The revenue in the year ending May 31, 1900, was 14,123,278 soles, and the expenditure 13,919,970 soles. For the year ending May 31, 1901, the revenue from customs was estimated at 7,857,100 soles; from taxes, 5,485,360 soles; from the salt monopoly, 800,000 soles; from posts and telegraphs, 461,330 soles; from other sources, 706,110 soles; total revenue, 15,309,900 soles. The estimated expenditure for the Congress was 385,250 soles; for the Ministry of the Interior, 2,951,400 soles; for the Ministry of Foreign Affairs, 634,590 soles; for the Ministry of Justice, 1,314,710 soles; for the Ministry of Finance, 4,688,700 soles; for the Ministry of War and Marine, 3,364,530 soles; for the Ministry of Public Works, 378,280 soles; total expenditure, 13,717,460 soles.

The Army and Navy.—The peace strength of the army is 6 battalions of infantry, of 320 men each; 7 squadrons of cavalry, numbering 800 men; 1 regiment of artillery, numbering 600 men; and 2,000 police. French officers have undertaken to reorganize the army, which has lately been provided with 20,000 Mauser rifles, 24 light field-guns, and 24 Gatlings.

The naval force consists of the cruiser Lima, of 1,700 tons, the transport Constitución, and the small steamers Santa Rosa and Chaluco.

The foreign debt, consisting of the 6-per-cent. loan of 1870 and the 5-per-cent. loan of 1872, originally amounting to £31,579,080, with arrears of unpaid interest which amounted in 1889 to

£22,998,651, was assumed in 1890 by the Peruvian Corporation, which, as agent of the bondholders, received the concession of the railroads, the guano deposits, the mines, and the public lands for the period of sixty-six years. Chile, having possession of some of the guano islands, made arrangements to pay the proceeds of sales of guano to the bondholders, but a dispute having arisen, the moneys were deposited to await the award of a court of arbitration at Lausanne, which, in November, 1901, delivered its decision as to the distribution of the amount in dispute, which was £558,566. On Feb. 2, 1901, the guano deposits on Huanillos, Punta Lobos, and Pabellon de Pica, which had been surrendered to the Peruvian Corporation, reverted to the Chilean Government, while the island of Lobos de Afuera was retained by the corporation. The internal obligations, including the floating debt, amount to 40,000,000 soles, on which 1 per cent. interest is paid.

Commerce and Production.—The quantity of cotton exported in 1900 was 7,246 tons; of coffee, 1,450 tons; of sugar, 112,000 tons. The Peruvian Corporation has attempted to colonize its concession, consisting of 2,750,000 acres. The coca plantations in Libertad comprise 2,700,000 trees on 9 estates. The export of coca in 1900 was 630 tons, besides 10,479 pounds of cocaine. Of alpaca wool 2,030,700 kilograms were exported in 1898 and 1,280,000 kilograms of llama wool. About 1,500 tons of rubber are annually shipped down the Amazon river from Iquitos.

There were 4,714 mines in 1899, many of which had been abandoned. The minerals include silver, copper, lead, gold, zinc, quicksilver, salt, sulfur, coal, and petroleum. From the Cerro de Pasco mines were exported 16,800 tons of ore containing from 30 to 50 per cent. of copper in 1900, and the same mines produced 1,000,704 ounces of silver in 1898.

The total value of imports in 1900 was 23,171,500 soles, and of exports 44,979,990 soles, not including the trade down the Amazon from Iquitos. The imports of cotton goods were 3,612,570 soles; of provisions, 2,529,030 soles; of furniture, 1,691,620 soles; of woolen goods, 1,477,630 soles; of other textile fabrics, 665,090 soles; of drugs, 971,540 soles; of miscellaneous merchandise, 7,988,644 soles. The exports of ores were 16,950,558 soles in value; of sugar, 14,558,420 soles; of cotton, 3,260,740 soles; of wool, 2,966,730 soles; of cocaine, 1,161,780 soles; of hides, 1,085,580 soles; of coffee, 654,310 soles; of rice, 639,080 soles; of borax, 566,370 soles. The values of imports from and exports to different countries in 1900 are given in soles in the following table:

COUNTRIES.	Imports.	Exports.
Great Britain	10,511,450	20,892,680
United States	2,974,260	2,548,960
Germany	8,505,990	5,159,680
Chile	914,132	6,105,200
France	1,563,490	1,204,680
Bolivia	98,860	995,510
Italy	970,760	55,860
Belgium	725,380	21,250
Ecuador	55,600	444,030
Spain	142,610	32,010

Navigation.—The number of vessels entered at the port of Callao during 1900 was 497, of 659,314 tons, and the number cleared was 494, of 655,859 tons, excluding vessels under 50 tons, of which 889, of 349,391 tons, were entered and cleared.

The merchant marine in 1900 consisted of 57 sailing vessels of more than 50 tons, having an aggregate tonnage of 28,458 tons, and 5 steamers of 4,253 tons.

Railroads, Posts, and Telegraphs.—The length of railroads in operation in 1898 was 1,035 miles, of which 844 miles were operated by the Peruvian Corporation. The capital cost was £36,000,000 sterling, including lines in the provinces ceded to Chile. Steamboats of the Peruvian Corporation on the Desaguadero river and Lake Titicaca connect with railroads. Receipts from railroads and steamboats in 1901 amounted to £493,827; expenses, £293,069; net earnings, £200,758.

The telegraphs in 1898 had a length of 1,933 miles, of which 1,400 miles belonged to the Government and 533 miles to the Peruvian Corporation.

The post-office handled 9,311,856 letters, postal cards, newspapers, etc., in 1899.

PHILIPPINE ISLANDS, a possession of the United States, ceded by Spain in the treaty signed at Paris on Dec. 10, 1898. Military government was superseded wherever the country was pacified on July 4, 1901, by civil government on a system planned by the Philippine Commission, composed of Judge William Howard Taft, of Ohio, president; Henry C. Ide, of Vermont; Luke E. Wright, of Tennessee; Bernard Moses, of California; and Dean C. Worcester, of Michigan. The members of the commission were appointed to carry their scheme into effect, and the Government was constituted as follows: Civil Governor-General, William H. Taft; Lieutenant Civil Governor, Luke E. Wright; Secretary of Finance and Justice, Henry C. Ide; Secretary of Commerce and Police, Luke E. Wright; Secretary of Public Instruction, Bernard Moses; Secretary of the Interior, Dean C. Worcester. The commander-in-chief of the forces and Military Governor-General at the beginning of 1902 was Major-Gen. Adna R. Chaffee. Dr. Detavera, Benite Legarda, and José Luzuriaga, natives of the Philippines, were appointed additional members of the Philippine Commission. Municipal government was established by the military authorities before the inauguration of civil government in accordance with the recommendations of the Philippine Commission in the provinces that seemed to be thoroughly pacified, and was extended after the transfer of authority. Early in 1902 there were 765 towns, three-quarters of all the towns in the islands, organized as municipalities, each with a president, a vice-president, and a council elected for two years by qualified voters. The qualifications for voting were ability to read and write English or Spanish, ownership of property worth \$250, the payment of \$15 a year in taxes, or the fact of having held a municipal office. Only 1.8 per cent. of the population qualified under these conditions. A Supreme Court was established, consisting of 7 judges, and courts of the first instance were instituted in 14 judicial districts. A native police force was organized. Provincial government was inaugurated, and the following provincial civil governors were appointed: H. P. Whitmarsh in Benguet province; Major E. M. Johnson, Jr., in Romblon; Capt. J. M. Goldman in Bataan; Col. C. Gardener in Tayabas; Ceferino Joven in Pampanga; Capt. Wallis O. Clark in Tarlac; José Serapio in Bulacan; Perfecto Sison in Pangasinan; Major W. H. Holbrook in Antigua; Hugo Vidal in Capiz; Major Henry T. Allen in Leyte; Capt. A. U. Betts in Albay; Lieut. George Curry in Ambos Camarines; Bonifacio Serrano in Masbate; Capt. J. G. Livingston in Sorsogon; Martin Delgado in Iloilo; Ricardo Paras in Marinduque; Prudencio Garcia in Surigao; Manuel Carrales in Misamis; Major W. H. C. Bowen in Abra.

The provincial governors were ordered to report to Gov. Taft at Manila, who reported to the

President at Washington through the Secretary of War. In regard to taxation and in all other matters ordinarily belonging to civil government the authority of Gov. Taft and his Cabinet was complete. Troops were ordered into the organized provinces by the commanding general only at the request of Gov. Taft on a call from the provincial governor. Surplus revenue in excess of the requirements of civil government were applied to the building of roads and other internal improvements, thus giving work to thousands of unemployed natives and helping to pacify the country. The development of the material resources of the islands by corporate capital was retarded by the safeguards which Congress imposed on the granting of franchises and the exploitation of the natural wealth. All military, civil, and judicial powers necessary to govern the Philippine Islands were vested, unless otherwise provided by Congress, in such person or persons as the President of the United States may appoint, to be exercised in such manner as he shall direct for the establishment of civil government and for maintaining and protecting the inhabitants of the islands in the free enjoyment of their liberty, property, and religion; but all franchises granted under the authority of this law shall contain a reservation of the right to alter, amend, or repeal them, and no sale or lease or other disposition of the public lands or the timber thereon or the mining rights therein shall be made; nor shall any franchise be granted which is not approved by the President of the United States and is not in his judgment clearly necessary for the immediate government of the islands and indispensable for the interest of the people, and which can not without great public mischief be postponed until the establishment of permanent civil government, and all such franchises shall terminate one year after the establishment of permanent civil government. Until a permanent government shall have been established in the archipelago full reports must be made to Congress at the opening of each regular session of all the legislative acts and proceedings of the temporary government, and full reports of the acts and doings of the government and as to the condition of the archipelago and its people shall be made to the President, including all information which may be useful to Congress in providing a more permanent government.

Schools were established throughout the islands upon the introduction of regular government. About 1,000 teachers were brought over from the United States, and 2,000 native teachers were employed to teach elementary subjects; 150,000 children were enrolled in the schools, and 10,000 adults were instructed in English. A normal institution was established to train native teachers. The Philippine Supreme Court was organized with Cayetano Arellano as presiding justice and J. F. Cooper, Fletcher Ladd, Victorino Mapa, Florentino Torres, and Charles A. Willard as associate justices.

Area and Population.—The area of the Philippine Islands has been estimated at 129,853 square miles. That of the principal islands is 119,542 square miles. The population has been variously estimated between 7,500,000 and 10,000,000. The Spanish estimate was 9,000,000; that first adopted by the American officials was 8,000,000. There are 69 savage tribes known of which no enumeration is possible, and the estimates of their numbers vary widely. The area of Luzon is estimated at 44,235 square miles, and that of Mindanao at 46,721 square miles. The latest esti-

mate of population is 6,975,073 for the whole archipelago. From reports of local officials in 1840 the total was estimated at 3,096,000; from reports of parish priests in 1850 it was raised to 3,800,163; the civil census of 1876 gave 5,567,685, not including 602,853 non-Christians, the estimated number; the civil census of 1887 made the total 5,984,727; and from the partial census of 1896 it was estimated to be 6,281,339. The inhabitants of the islands are divided into 84 local tribes, and 30 distinct languages or dialects are spoken; yet, excepting the dwarf Negritos and the Indonesians of Mindanao, all the races and tribes are of Malayan stock, with Chinese, Japanese, and other crosses. The Negritos, supposed to be the aboriginal inhabitants, live in the mountains and do not now number over 30,000, though they are divided into 21 tribes. They are believed to be identical in race with the Mincopies of the Andamans and the Sakals of the Malay peninsula. They rove through the mountain forests in small groups of a few families each, feeding on roots and small game. Most of them are only 3 feet high, and they are timid and shy, yet to a certain extent they are feared by the more civilized tribes. The Indonesians, estimated at 252,200, divided into 16 tribes, are a tall, muscular race of light color, having wavy hair and abundant beard, high forehead, and aquiline nose, showing affinities with the Polynesian races. The Malays are estimated at 5,699,400, divided into 47 tribes. The Visayans number about 2,601,600; Tagalogs, 1,633,900; Bicolos, 518,100; Ilocanos, 441,700; Pangasinans, 365,500; Pampangos, 337,900; Cagayans, 166,300; and Moros, outside of Mindanao, 100,000. The Tagalogs, who are the civilized race among the Filipinos, live around Manila and form progressive communities in other provinces and islands. Besides these the Bicolos of Sorsogon, Albay, Ambos, Camarines, and Tayabas are Christians, and so also are the Visayans of the middle islands of the same name and the coast of Mindanao, and the Pampangos, Pangasinans, and Ilocos who inhabit the provinces named from them. The Cimarones of the Camarines peninsula, the Itanegs of Lepanto and Abra, the Ifaguas of the Caraballos mountains, the Catalangans of Isabela province, and the Manguians in Mindoro are pagan tribes of Malays. The Moros, or Mohammedan Malays, inhabit Sulu, Tawi Tawi, and Palawan to the number of about 40,500, while 200,000 live in the lake region of Mindanao and on Illana Bay, on the Gulf of Davao is a tribe having an admixture of Indonesian blood, and on the south coast are the Sanguilles, on the little island of Olutanga the Lutangas, on the Gulf of Sibuguey the Calibugans, on the shores of Basilan the Samales-Laut, and in the interior of that island the Yacanes. The Moros have an organized system of government, the pagans only savage tribal government. Slavery is practised by the Moros, the wild Indonesian tribes, and the pagan tribes of northern Luzon. Spanish mestizos are found in all parts of the archipelago where European commerce reaches and are very numerous in Manila and its vicinity and in all the more important towns. The Chinese mestizos are intelligent and enterprising, but have the reputation of being treacherous and addicted to conspiracy. The Chinese have been in the Philippines from early times, coming first as conquerors and later as merchants and artisans. The number of Chinese residents in 1887 was estimated at 37,585. A law was made in 1888 to stop Chinese immigration, but the attempt was a failure. In September, 1898, the provisions of the United States

Chinese exclusion act were extended to the Philippines, and since then only former residents and the exempt classes can lawfully be admitted. Employers of labor and some of the Government officials deprecate their exclusion, against which the Chinese Government has strongly protested. In two years and a half after the law went into operation as many as 27,696 were admitted and 23,658 returned to China, showing a net increase of 4,038. The Spanish estimate of their number is shown to have been much too low by a census lately taken in Manila which credits that city alone with a Chinese population of more than 50,000. The Spanish language is known to all educated persons and is the only vehicle of education, since only rudimentary and colloquial English has yet been taught. About 9 per cent. of the people are able to speak Spanish. The masses know only the native dialects of their respective tribes and districts.

Commerce and Industry.—The soil of the Philippines is very fertile, and the parts that have been brought into cultivation produce large crops of rice, corn, Manila hemp, sugar, tobacco, indigo, and cacao. Coconut-palms thrive, and the export of copra is increasing. Cotton was formerly cultivated and woven into cloth in large quantities, but this product has been displaced by European manufactures. Large coffee plantations have been ruined by insects. The best tobacco is grown in Luzon and is exported in the leaf or manufactured into cheroots and cigars at Manila. Large quantities are grown also in other islands, and the consumption of the people is large as all the inhabitants of both sexes are smokers. The rice-crop is about 765,000 tons, in addition to which about 50,000 tons are imported annually to supply the needs of the population. Luzon and Mindoro produce the rice and corn; Mindanao and the southern islands the cacao; southern Luzon, Mindoro, the Visayas, and Mindanao the hemp; southern Luzon the greatest quantity of coconuts; and the Visayas the sugar. Gold is mined with profit in the mountains of Luzon, and in this island iron is obtained. In Cebu there is a lead-mine and coal-mines have been opened. Petroleum has been found in several islands, but is not utilized. Rice, flour, beer, and wine, textiles and clothing, kerosene, and coal are the principal imports. The exports of Manila hemp in 1900 were 688,392 bales, against 600,738 bales in 1899; of sugar, 966,827 piculs, against 1,488,854 piculs; of cigars, 156,316,000, against 138,493,000; of leaf-tobacco, 188,368 quintals, against 114,261 quintals; of copra, 1,023,727 piculs, against 278,227 piculs; of sapan wood, 3,924 tons, against 556 tons. The total value of imports in 1900 was \$20,601,436, and of exports \$19,751,068. In 1901 the imports amounted to \$30,279,406 and the exports to \$23,214,948. Hemp is exported mainly to the United States and Great Britain; cigars, tobacco, and copra to European countries; sugar and sapan wood to China and Japan. The imports into the United States from the Philippine Islands were \$5,971,208 in value in 1900 and \$4,420,289 in 1901; exports from the United States to the Philippine Islands were \$2,640,449 in 1900 and \$4,027,064 in 1901. The imports into the United States from the Philippine Islands in 1900 were hemp for \$5,014,770, sugar for \$925,335, and tobacco and cigars for \$1,068; exports from the United States to the Philippines included beer for \$563,950, live animals for \$441,950, iron and steel manufactures for \$383,892, and cereals for \$168,726.

The rainy season sets in late in June and ends early in September. Corn ripens in twelve weeks,

and two crops are grown every year, and one crop of tobacco on the same ground. Manila hemp is a native plant grown in abundance in forest lands. Though other tropical countries are probably suitable for its culture, it is produced nowhere except in the Philippines. The problem of increasing the product does not depend on cultivating more plants, but on extracting the fiber more easily. The hand-machines now used are carried into the hemp forests and worked by three men. The process is so slow that only about a sixth of the plants are cut and stripped into fiber. The fiber deteriorates rapidly after the stalks are cut, and therefore the extraction can not be carried on at a central factory unless transportation is much improved. From the hemp and from the native pineapple fiber the natives weave handsome light diaphanous cloths, often shot with threads of bright silk, that are universally worn. The pineapple cloths are also exported to Singapore, where the Chinese pay for them high prices. This fiber, too, is extracted by primitive hand-machines. The tobacco of the Philippines is inferior to that formerly grown. No fresh seed has been imported from Cuba in many years, and no attention is given to the selection of seed. David G. Fairchild, sent as an expert to explore the agricultural resources of the islands by the Department of Agriculture, suggests the distribution by the Government of good Sumatra and Havana seed and selected seed of Manila-grown tobacco. Rubber, gutta-percha, tea, coffee, and cotton are proposed as experimental cultures. For the exploitation and protection of the valuable timber resources of Mindanao and other islands the methods pursued in Java by the Dutch are recommended for imitation. The hard woods of the Philippines are remarkable for size as well as quality. There are large forests of giant trees, some of them, like the hard dark brown harra wood, 7 or 8 feet thick. Imports were larger during the early period of the American occupation than later. In 1902 they showed no appreciable increase owing to a scarcity of money and the still unsettled state of important districts. Exports fell off because when the blockade was first raised the accumulated stocks of hemp and other products were shipped at once, and this temporary movement soon came to an end. Southern Luzon, which produces hemp and copra, and Samar, one of the most important hemp islands, were so disturbed that there was little to export in the early part of 1902, and the hemp exports of Leyte suffered from an influx of Samar rebels. Cebu, which was first pacified, became the most important source of the hemp supply. Sugar cultivation in Panay and Negros was not disturbed. Rice was planted in smaller quantities than usual, and the crop, owing to drought, was unusually light. Agriculture was retarded not only by the impoverishment and disturbance resulting from five years of warfare, but by the loss of a large proportion of the water buffaloes by rinderpest and another epidemic disease peculiar to the islands. From Mindanao the Mohammedan Malays ship hemp, rubber, gums, and other tropical products. The Sulu Archipelago has more trade with Singapore than with Manila, and it is carried on by Chinamen. From Palnan they ship bird's-nests and trepang to Hong-Kong.

The total value of imports in 1902 was \$32,750,000 in gold, of which nearly half came from British ports. The exports amounted to \$20,750,000, of which \$13,750,000 went to British ports. The exports of hemp were 913,349 bales. The export duty on hemp sent to the United States

was abolished. Owing to local and temporary causes the exports of sugar, copra, and tobacco declined. The failure of the rice-crop in many districts caused such a dearth of food that the Government appropriated \$2,000,000 in silver to buy and transport rice to be sold at cost price in the places most in need. Formerly the Philippines produced a surplus of rice to export to China, but the exports gradually fell off and finally ceased, and of late years large quantities have been imported from Cochin-China, Burma, and Siam to supply the deficiency of the home crops. Tobacco, sugar, and the popular and increasing hemp-crop are much more profitable than paddy planting, which is carried on in most instances on a small scale by petty cultivators who grow little more than is necessary for their own families. The most primitive and laborious methods are used in cultivating, harvesting, and cleaning the paddy. As rice of both the variety grown under water and the upland variety thrives in the Philippines, and there is a great deal of unused land suitable for its growth, it is intended to promote the cultivation by economical methods on a commercial scale, so that the country will not depend on others for its food-supply. The great increase in imports as compared with Spanish times is not due to larger production, but to the amount of money put into circulation by the army and the civil administration. Large amounts have been paid out in wages for public works. Wages have doubled, and labor is still so scarce that those who are engaged in private enterprise deplore the exclusion of Chinese. The natives are considered by some to be too indolent and careless by nature to be suitable for work on a large scale. Others find them honest and industrious. A temporary relaxation of the restrictions on Chinese immigration is under consideration, though in the long run Gov. Taft says that native labor must be depended on. The value of real estate in the centers of population has gone up enormously. Activity in building, especially in Manila, created a demand for native timber. In spite of the depression of agriculture due to war, rinderpest, and cholera, reducing the area under cultivation to only half that of ordinary years, the imports of merchandise in the year ending June 30, 1902, exceeded the figures of any previous year, amounting to \$22,141,842 in gold. From the date of the American occupation the total imports were \$96,135,694, on which over \$22,500,000 duties were collected. Gov. Taft held out hopes to the Filipinos that after two years there would be free trade between the United States and the islands. The United States Supreme Court decided that duties collected in the United States under the general tariff law were illegal and that free trade existed until Congress enacted a tariff to govern the trade relations between the Philippines and the United States. The Philippine tariff bill voted by Congress, which went into force on March 8, 1902, reduces the import duties 25 per cent. on Philippine products imported into the United States and on United States products imported into the Philippines. The export duties on Philippine products shipped to the United States are reduced proportionally by means of a rebate if the goods are consumed in the United States. Germany and Great Britain complained of this reduction as a preferential rate imposed to the detriment of the old-established trade in Manila hemp, and hence contrary to the assurance given by the United States. German, English, French, and Chinese have enterprises in the Philippines and have brought much

additional capital in since the American occupation, but very little American capital has flowed in, although sugar, cacao, and coconut plantations return over cent. per cent., machinery is needed for cleaning rice, hemp and cacao grow wild and go to waste, the vast mineral wealth of the islands remains untouched, steam communication between the islands is a crying need, the forests contain woods capable of a high polish and are as fine in color and markings as any cabinet-woods in the world, there are forests of gutta-percha trees awaiting exploitation, and pearl fishing is an enterprise of great promise into which Japanese and Russians have already ventured. Existing businesses have such need of capital that 25 per cent. is paid for well-secured loans. The new fall in the gold value of silver in 1902 disturbed the external commerce and the internal business situation. The Philippine Government advocates a gold basis. In November, 1902, the Government was compelled to raise the rate of exchange to 250, making the value of the Mexican dollar 40 cents in United States money. A silver currency for the Philippines with a dollar exchangeable at an official fixed rate for half a dollar in gold, like the Japanese yen, is recommended by Lieut.-Gov. Luke E. Wright, the Secretary of Commerce.

Railroads and Telegraphs.—There is a railroad running northward from Manila through the center of Luzon, the length of which is 120 miles. The telegraphs have a length of 720 miles.

End of the Insurrection.—At the beginning of 1902 the insurrection was extinguished in all parts of the peninsula except in the provinces of Batangas and Laguna and the islands of Samar, Mindoro, Cebu, and Bohol. In Mindanao the Government entered into arrangements with the Mohammedan chiefs, but did not attempt to impose direct American rule over the Moros. Except among these people and in the disturbed districts it was safe to travel unarmed in all the provinces. To prevent a recrudescence of the insurrection a sweeping law was enacted by the Philippine Commission declaring it to be treason to levy war against the Government or give aid or comfort to the enemy, misprision of treason to conceal knowledge of treason, criminal insurrection to incite or abet any movement for the overthrow of the Government, conspiracy to plot to destroy the Government or hinder the execution of its laws, and sedition to rise tumultuously to prevent the promulgation of laws, the free holding of elections, or the execution of judicial or administrative orders by provincial, municipal, or other public officials, or to inflict any act of hate or revenge upon insular, provincial, or municipal officials, or with political or social objects upon any other individuals or class. The punishment for these various crimes was imprisonment for terms of which the maximum varied from five to ten years. Any person uttering seditious words, or circulating libels or instigating cabals against the Government, or inciting conspiracies or riots to obstruct the execution of the laws or stir up the people against lawful authority or disturb the peace, was made punishable with two years' imprisonment; and a term of one year was decreed for persons belonging to secret societies or forming new ones for promoting treason, rebellion, or sedition, or the promulgation of any political opinion or policy, while every person administering or attending a meeting where oaths were administered binding a person to commit crimes against the Government could be imprisoned for ten years, and every one administering or consenting to oaths or en-

agements to take part in any seditious practise or disturbance of the peace or to refuse to inform against confederates or reveal any unlawful conspiracy or secret society was made punishable with imprisonment for five years. Until the state of war or insurrection should be officially proclaimed to be at an end it was declared to be unlawful and punishable with one year's imprisonment to advocate orally or in writing or print the independence of the Philippine Islands or their separation from the United States, whether by forcible or peaceable means. Any person having taken an oath of allegiance to the United States who afterward violated the oath was made liable to ten years' imprisonment. The provisions of the law did not extend to the provinces still in insurrection. This law, copied from the United States statute of treason in its main provisions, was a *brutum fulmen* as far as any possibility of checking the insurrection by fear of the civil power was concerned. The civil power was not there to inspire fear, but to encourage self-reliance and ideas of liberty, to win the confidence of the natives, and to train them in self-government, a task that seemed hopeless owing to their abject and blind submission to those of their fellows who were sufficiently intelligent, rich, powerful, ruthless, cunning, and masterful to compel a superstitious obedience and devotion springing from awe of the superior and dread of the tyrant. It was the army's work to suppress the insurrection, and now when the insurgents were reduced to the guerrilla bands of half a dozen of the most disreputable of the leaders operating still in only four provinces it seemed as interminable as when the Philippine republic was alive with an army in the field. The civil officials and many of the military garrisons were getting on admirably with the Filipinos, whose ready intelligence, friendly and hospitable disposition, and eagerness to become Americanized persuaded the Americans stationed among them that if all Americans treated the Filipinos with confidence and respect and made them their friends all the troubles would disappear. That was not the opinion of the soldiers sent to crush out the rebellion in the disturbed provinces. They knew that if they treated the natives with friendly confidence they were liable to be massacred as at Balangiga; that every native who proved his friendship by helping them to capture *insurrectos* or concealed arms was marked out for murder; that the leading men in the community, who received them with hospitality and professions of loyalty and praised the American system of government of which they themselves were sworn officials were at the same time in constant communication with the insurgent leaders; that the rebel bands subsisted on the willing or unwilling contributions of these peaceful Americanized municipalities. They learned from Macabebe scouts and native volunteers ways of extracting information as to the whereabouts of insurgents and hidden arms that were sanctioned by native custom, though not by the rules of civilized warfare. Fighting in the Philippines is fraught with difficulties and terrors. The long and usually bootless marches in mud or dust with insufficient food, the stifling heat, the fever and other tropical ailments unnerve and incapacitate men for dealing with an alert and treacherous foe. The American soldiers have frequently met a sudden surprise or ambush when every one in the detachment was faint with sickness, and never have they run or given up their arms. Yet they had reason to dread an enemy so agile that a boloman could creep up unseen like a snake, spring at a sentry, and

snatch away his rifle; so savage as to mutilate and defile corpses and torture prisoners with fire; so well informed, active, and secret that he could attack by surprise at the most favorable place and moment. Prisoners that small columns of tired and sickly Americans could not take with them, prepared when released fresh attacks from front and rear; so there were battalions that took no prisoners. The rebels often raised a white flag to facilitate retreat or a hostile movement, and the white flag had with them no other purpose, hence there were officers who disregarded it. In a few regiments squads were detailed to get information of the enemy by the only means the Spaniards formerly found effective, the infliction of bodily pain and mental terror. When it was suspected at headquarters that the Macabebes and even American soldiers resorted to forms of torture, such practices were expressly forbidden in orders; yet soldiers at the front did not always obey. The Military Governor-General and his staff were of the same mind. The continued impoverishment of the people, aggravated by the blackmail levied by the rebel leaders, rendered the situation dangerous, and it was known that some of the leading men in Manila and many of the officials in the provinces were doing their best to keep the embers of rebellion alive in hope of a fresh conflagration. Gen. Smith was sent to clear Samar, and his order, when by Lucban's order the people left the coast towns, that they should return or be regarded as rebels, was approved. A blockade was declared in all the ports of the insurgent districts. Gen. Wheaton adopted the plan of concentration camps in the insurrectionary centers in Luzon to prevent Malvar from getting provisions and recruits, and this also was approved. As soon as the report reached Manila of the massacre and horrible mutilation of 50 unarmed American soldiers at Balangiga by their pretended friends, Gen. Chaffee ordered Col. de Russy and other officers having troops within striking distance to send out punitive expeditions to chastise the savages. Before Gen. Smith arrived to occupy the island, which had become the stronghold of the rebellion since the pacification of Luzon, these expeditions burned many towns in southern Samar and destroyed all boats and all supplies they could lay hands on. Gen. Smith divided the island into districts, and the commander of each district under his instructions ordered the concentration of all the inhabitants at places designated for their residence, warning those who remained out in the hills with the rebel bands that they would after a delay of fifteen days be regarded as insurgents. In the swamps and jungles of the southern end, the forest and river gorges of the middle and northern plateau, and the precipitous mountains and deep valleys of the coast districts the American columns found Samar the most difficult country to march through they had known, and, weakened by fever and dysentery and the leeches with which the island is infested, they had to meet at every stage an ambush of bolomen, whose weapons in the spots they chose to fight were more effective than their own. The soldiers fell into concealed pitfalls upon poisoned spearheads; they were transfixed by spears fastened to bent saplings to be released by tripping against a trailing vine; they were drowned by boulders rolled from cliffs upon their boats. When the Samarites attacked they fought desperately, expecting no quarter, as by

Lucban's orders they were to give none. Capt. Preston's detachment of the Forty-third United States Volunteers and Major Waller's marines crossed the island with a heavy sacrifice of men. Every other column had to turn back. Lieut. Downs and most of his detachment fell in a hand-to-hand encounter after their provisions had given out and two-fifths of the men in his small column were already incapacitated by wounds and disease. Capt. Francis Schoeffel's party, surprised by bolomen two to one, had not a man unscathed when Lieut. Lang came to the rescue. Lieut. Wallace's post of 25 men on the Gandara river, while the commander himself was absent, was rushed at daybreak by 200 bolomen, but they had room to use their rifles, and when reduced to 10 men these had one part of the savages helpless on a point of land and craving mercy while the main body kept up the attack from the jungle. The men, who killed 84 of the enemy during the fight, were exonerated by Gen. Smith for not granting quarter under the circumstances.

Gen. Chaffee chose energetic and incisive officers to conduct the operations and warned them that they were dealing with a people whose character is deceitful, who are absolutely hostile to the white race, who regard life as of little value, and who would not submit to American control until absolutely defeated; hence every male should be suspected unless he proved his loyalty by action that could not be misunderstood, and every hostile motion of any inhabitant should be quickly and severely punished so as to inspire a wholesome fear of the army, and any means taken to disarm the people and keep them disarmed would be approved. Gen. Smith in Samar and Gen. Bell in southern Luzon, convinced that the insurrection was supported by wealthy people living in the *pueblos* and enjoying American protection, adopted methods calculated to create in all the people an interested desire for peace, and gave orders to treat as an enemy every native, whether in arms or living in the *pueblos* or *barrios*, until he conclusively showed that he was a friend by positive acts committing himself openly to the American side, as neutrality would no longer be tolerated, and natives must demonstrate their loyalty by devoting themselves in earnest to bringing about a real peace.

The vigorous campaign of Gen. Smith in Samar and the increased severity of the military in dealing with *insurrectos* and their supporters and spies, although this harsh and often misdirected treatment of the natives estranged many who before were friendly, crushed out the rebellion effectually by making the secret friends of the insurgent leaders afraid to help them and ready to inform against them. To extract information from the unwilling some of the officers resorted to practices contrary to general orders that shocked the public conscience when revealed in the United States. The chief offense of this nature was a form of torture, formerly employed by the Spaniards, that the American soldiers called the "water-cure." It consisted in forcing a man, bound and lying on his back, to swallow rapidly a great quantity of water poured into his mouth until in fear and distress he was willing to confess. Gen. Chaffee ordered all military commanders to cooperate in every way with the civil authorities without relaxing their rigorous methods when dealing with active insurgents. The insurgent leaders in Luzon and Samar were forced at last to surrender with the handful of followers they had kept together to the last. Before the end of April the rebellion was entirely extinguished. Civil government was extended over the whole Christian-

ized territory of the islands, comprising the parts that are commercially and politically important, while military rule remained necessary only for the Mohammedan tribes of the southern islands, where Spain never obtained a firm foothold.

In the very last days of the insurrection the American public was led to believe from revelations of mistakes and misdeeds of the military in the Philippines that the rebellion had become chronic and the relations between the natives and the Americans more incurably bad than ever existed between the natives and their Spanish masters. Major L. W. T. Waller, who lost a part of his detachment from starvation and nearly perished himself in a march across Samar, was tried by court-martial on a charge of murder for ordering inhabitants of that island to be shot without trial. He pleaded that his acts were a just retaliation against the inhabitants of that island who had committed unspeakable atrocities on American soldiers, and, moreover, that he was following out the orders of Gen. Jacob H. Smith, which were to kill and burn and make Samar a howling wilderness, treating every male over ten years of age who had not obeyed the proclamation of concentration as an active insurgent. Major Waller was acquitted, and Lieut. J. H. A. Day, of the marines, was acquitted. Gen. Chaffee disapproved the findings as contrary to the evidence.

Major Cornelius Gardener, Civil Governor of Tayabas province, whose reputation was high both as a military officer and a civil administrator, made a report after a more vigorous military policy was adopted, expressing his opinion that the good sentiment and loyalty that formerly existed among the people of his province to the United States Government was being fast destroyed and a deep hatred engendered owing to the conduct of the troops, such as extensive burning of *barrios* in trying to lay waste the country so that the insurgents could not occupy it, the torturing of natives by the so-called water-cure, and other methods in order to obtain information, and the failure of inexperienced lieutenants to distinguish between friendly and unfriendly natives. The troops called all natives "niggers," and treated all alike harshly. When this report reached Washington the Secretary of War called upon Major Gardener for specifications and evidence and directed Gen. Chaffee to have his charges against the army investigated. A committee of the Senate was inquiring into the administration of the Philippines. The attention of the committee was irregularly brought to the Gardener report, which was held in the War Department for investigation, through Gen. Miles, who criticized the campaign in the Philippines for its marked severity. The committee, which questioned Gov. Gen. Taft closely on all Philippine affairs, sent for two discharged soldiers, who said they had seen the water-cure applied, and from them heard a story of the torture being administered to the president of a municipality under the direction of Lieut. Conger and the medical oversight of Surgeon Lyon by order of Capt. Glen. The President gave directions that every violation of law and every act of cruelty and barbarity be investigated in the fullest and most circumstantial manner and the offenders be brought to justice. It was believed at Washington that violations of humanity would prove to be few and occasional, and not to characterize the army in general. For the very reason that the President intended to back up the army in the heartiest fashion in every lawful and legitimate method of doing its work, he also intended to see that rigorous care was exercised to detect and prevent cruelty or brutality.

Orders were sent from Washington for the military trial of Gen. Smith and of Major Glen, Major Regan, Lieut. Conger, and Surgeon Lyon. Gen. Jacob H. Smith's advocate admitted to the full the orders in which Major Waller justified his conduct in having 11 natives executed without trial. Major Waller and Lieut. Day were acquitted on the ground that they were obeying orders. Gen. Smith's counsel justified the orders that he issued on the ground that they were covered by General Order 100, approved by President Lincoln in 1863. He had reduced to submission the treacherous and implacable inhabitants of Samar, a result that Spain had never been able to achieve, and yet had not transgressed the limits of retaliation for inhuman practices and breaches of the laws of war that are recognized in international law. The court found Gen. Smith guilty of the charge of conduct prejudicial to discipline and good order and sentenced him to be admonished by the reviewing authority. Sec. Root could find nothing in Gen. Smith's orders authorizing the illegal execution of natives over ten years old, yet the language of his orders was reprehensible; therefore President Roosevelt retired him from active service with a reprimand. The Senate censured the measures of Gen. Bell in Luzon, especially the concentration camps and the selection by lot of an insurgent officer or prominent citizen to be shot for every American soldier or friendly Filipino who was assassinated. Gen. Lloyd Wheaton accepted full responsibility for the plan of campaign carried out in obedience to his orders, as Gen. McArthur did for the ruse of war by which Gen. Funston captured Aguinaldo. Gen. Wheaton approved a report of Col. Wagner affirming the effectiveness of the concentration in protecting the natives of Laguna, Batangas, and parts of Cavite and Tayabas from guerrilla bands. After more than two years of occupation it had been found impossible to exterminate these bands or capture their leaders owing to the reign of terror which they exercised over the inhabitants. Their systematic assassination, sometimes by burying alive, of natives who refused to contribute to the support of the insurrection, enabled them to wring a steady war revenue from people presumably enjoying the privileges of free government and the protection of the United States. The War Department approved the policy that had, within a few weeks, brought to a termination the guerrilla warfare with its accompaniments of long-continued suffering, destruction, and assassination. The provincial secretary of Batangas, a loyal native, reported that during the wars the population of that province had been reduced, largely by disease, from 300,000 to 200,000, and that distress was general and famine imminent. The authorities at Washington upheld Gen. Chaffee in his policy that had proved effective and humane, and Gen. Bell and Gen. Smith in the measures of retaliation they adopted, holding that these came within the laws of war as codified in General Order 100 and were calculated to end fighting that was decimating the garrisons by the resort on the part of the natives to practices intolerable among civilized nations. Major Edwin F. Glen and his subordinates, accused of inflicting the water-cure to obtain information of natives who had roasted and otherwise tortured a soldier of their regiment, were tried later in the year. Capt. Cornelius Brownell admitted that Father Augustine, a Filipino priest at Banate, had died after the third application of the water-cure, the only death reported from this cause.

The concentration camps established by Brig.-Gen. J. Franklin Bell in Laguna and Batangas

provinces, where Malvar operated alternately, were not scenes of privation or suffering, for the people were better provided for than they ever had been before, and the mortality was less than in the neighboring provinces. When Malvar's sources of supply were cut off the native volunteers hunted down his rebel bands, one after the other. Their work resulted in the capture or surrender of 3,500 riflemen and hundreds of storehouses filled with ammunition and provisions. On April 15 Malvar himself surrendered to Gen. Bell at Lipa. A few days later the last of the *ladrones* in the island of Negros surrendered and took the oath of allegiance. On April 27 Major, now Brig.-Gen., Frederick D. Grant ascended the Gandara with two gunboats, and received the surrender of Guevarra, the last of the guerrilla leaders in Samar. This ended the insurrection.

On May 1 the ports of Batangas and Laguna were reopened for trade, and a few days later the ports of Samar. *Ladrones* were still at large in parts of the Philippines where there were mountains and forests to give them refuge. Sporadic murders of soldiers still reflected the fierce hatred of Americans with which many of the natives had been inspired by the teachings of the revolutionary leaders or the occasional lawlessness or arrogance of men of the army. A party of non-commissioned officers and privates while decorating graves of comrades near Manila were seized by natives, some of whom were policemen, and their limbs were hacked off.

From the battle of Manila, which occurred on Feb. 4, 1899, down to April 30, 1902, there were 2,651 engagements with the enemy, most of them skirmishes, in which small detachments took part or attacks from ambush on the American troops. In many cases the percentage of loss was high, yet in almost no engagement did American troops surrender or have to retreat or to leave their dead and wounded in the possession of the enemy. The number of troops transported to the Philippines up to the middle of July, 1902, was 4,135 officers and 123,903 men. The average strength of the army in the Philippines was about 40,000. The casualties from the beginning to the end of the insurrection were 69 officers and 936 enlisted men, killed or died of wounds; deaths from accident, 6 officers and 125 men; drowned, mostly in action or active operations, 6 officers and 257 men; murdered, 1 officer and 91 men; died of disease, 47 officers and 2,535 men; total deaths, 139 officers and 4,016 enlisted men; wounded, 190 officers and 2,707 enlisted men; total killed and wounded and deaths other than by disease, 282 officers and 4,188 enlisted men. The proportion of killed and wounded to the strength of the army was 9.7 per cent. The total cost of the war was \$170,326,586 in gold.

Campaign against the Moros.—On March 15 two soldiers of an exploring party in Mindanao were approached by Moros under the semblance of friendship, and after the rifle they had between them was snatched away both were stabbed, one of them fatally. The murderers were known, but the Dattos refused to deliver them. The Moros had always been friendly. Mindanao is more healthful than Luzon, probably as rich in natural wealth, and this is entirely undeveloped. Some of the Moros objected to the topographical surveys and exploration of the resources of the island that Gen. Chaffee had ordered. He told them that the Government had a right to explore the country. After the murder he went to Malanbag and summoned to a conference the Dattos, or chiefs, of the tribe to which the murderers belonged. They did not come. He left after sending a letter to the

Dattos saying that the authority of the United States must be respected and its sovereignty fully acknowledged. An expedition of 1,200 cavalry and artillery under Col. Frank D. Baldwin was ordered to leave for Lake Lanao on April 27 for the purpose of arresting the murderers and punishing the Moros who sheltered them. The American policy in dealing with the Moros has been to avoid any exercise of authority over the Moros so long as they outwardly acknowledged American sovereignty. The Spaniards, who had always left the Moros alone and practically independent, attempted two years before the cession of the islands to the United States, when the cessation of the Tagalog rebellion released their military and naval forces, to subjugate the lake Moros. They built a railroad, placed two gunboats on the lake, and kept fortified posts in the country for some time. Still they were unsuccessful. The loss of the Philippines put an end to their project, which required prolonged exertion and a greater development of power. The movement was favorable because the tie that formerly united the most formidable tribes, however loosely, no longer existed. The Mindanao Moros owe no political allegiance to the Sultan of Jolo, although recognizing that island as the source and center of Mohammedan civilization in the Philippines. Formerly there was a Sultan of Mindanao, who had sufficient prestige and authority to unite the tribes against an external foe. Datto Mandi, of Zamboango, who claims to be heir and successor of the former sultans, is chief of the tribe that has fallen most under the peaceful influences of European civilization. His hereditary right to exercise any authority over the powerful Datto Piang and the warlike and fanatical tribes of the Dattos Ali and Utto is rejected with scorn. The Moros therefore relapsed into jealous and mutually hostile tribes. They speak four different languages, and there is little intercourse except among neighboring tribes, and these are often at war with each other. Those about Lake Lanao cultivate the land well with their slaves and are numerous and rich. Since the Spaniards attempted to establish their power over them they have accumulated arms and strengthened their fortifications. Every house is fortified, and they make pitfalls and entanglements in the roads and have strong central forts of masonry, with their native bronze cannon, called *lantakas*, swung in embrasures on pivots or hanging from beams. All Moros are armed with the curved *kris* of highly tempered steel, which comes from Borneo. They are noted as cunning, swift, agile, and muscular fighters, and their Mohammedan fatalism and fanaticism makes them more daring, desperate, and ferocious than Christian Malays. The picked men swear to their Dattos to conquer or die in battle. Recently they had obtained rifles from unknown sources. The authorities at Washington were inclined to countermand Gen. Chaffee's order for a punitive expedition, fearing that it would lead to a war with the 400,000 Moros of Mindanao, united and inflamed by religious zeal against Christians. When assured by Gov. Taft that there was no danger of their uniting and by Gen. Chaffee that the large majority of the tribes would remain as friendly as ever, some in the neighborhood of the scene of action, but that if American military power were not demonstrated to those who now challenged it no garrison could be kept on the island without fighting, the Secretary of War authorized the projected movement to be carried out provided a peaceful solution could not be reached by parleys, but operations were ordered to be restricted as far as possible to the objects the expedition was sent

to attain. Brig.-Gen. George W. Davis was placed in charge of operations. When the troops advanced red flags were seen flying from the villages, indicating that the inhabitants intended to fight to the last. Every Datto's house was a fort, with trenches about it, stone walls, and bamboo stockades. There were many Dattos, and therefore many forts, stockades, and intrenched positions to be carried. None of them, however, were strongly defended. Each fort was supplied with one or more old cannon, a few small guns, and many bamboo cannons, and when these responded ineffectually to the shell and shrapnel the defenders retreated safely by covered passages, offering little of the expected hand-to-hand fighting from lurking-places with bolo and spear. The troops advanced cautiously, to avoid traps and surprises, at the rate of 8 miles a day. On entering Bayan, the land of the murderers, Gen. Davis on May 1 sent a message to the Dattos demanding that they give them up or send a peace delegation with explanations. Instead of answering, the Moros fired upon the troops at night. In Bayan, near the lake, a large stockaded fort, defended by 300 men, was shelled, but was not taken until the infantry rushed the trench. On the shore of the lake was a small fort to be taken, covered like the others with brush to screen the men with rifles and shotguns and hide portholes. The field-battery shelled the walls, but made no breach nor even silenced the fire of the *lantakas*, which fire cartridges of bamboo an inch and a half thick and four inches long, enclosing tightly packed slugs, screws, pebbles, and bits of glass. At close range they did considerable execution. When the Moro fire slackened at last and the fort was presumably wrecked the troops advanced from all four sides. They came to a trench filled with Moros, who fought to the death. Some of the men and horses fell into deep pitfalls. Another trench was enfiladed, and then a third, and a fourth. The Sultan and Dattos of Bayan and the Sultan of Pandapatan, the builder of the fort, were killed and most of their men. When the fort surrendered at daylight on May 3, 84 survivors were found inside, while some escaped by a tunnel to the lake. The American losses were insignificant in the previous actions, but in this engagement 1 officer and 7 men were killed and 4 officers and 39 men wounded. The taking of Fort Pandapatan ended the task of the expedition. A fortified post was established at Vicars, in the interior, and strongly garrisoned, and communications were kept open with Zamboango on the sea-coast.

In the rainy season the Moros harassed the camp at Vicars and stabbed several unwary outposts with bolos. On Aug. 1 a party crawled noiselessly in the dark and fog to within leaping distance and killed two sentinels and wounded another with spears and *kris*es. These men were from Bacolod, whose Sultan, formerly friendly, had been strengthening his forts since the arrival of the Americans, and was sending messages of defiance and committing depredations. The Maciu Moros were equally truculent and yet bolder in their attacks. Tagalog intriguers deluded the Dattos and Sultans into believing that the Spaniards were driving the Americans out of the Philippines, and that the United States was at war with the Sultan of Turkey, recognized by the Moros as the Caliph of Islam. The main motive of their hostility was still that they had always been in possession of the country about Lake Lanao and would defend it from American, as they had from Spanish occupation. Gen. Chaffee considered that a campaign was necessary to curb

the growing hostility of the Moros and received permission to use his own discretion in the matter. When the rains ceased Brig.-Gen. Samuel S. Sumner mustered a force of 1,100 infantry and cavalry with a mountain battery at Camp Vicars. Before these were assembled the Moros made several attacks on the American camp, which Capt. John J. Pershing, the commander, repelled with his cavalry. On Sept. 17, Capt. Pershing advanced at the head of a column of 700 men against Maciu. The Americans met but slight opposition at first, capturing three forts in Goanan, two in Bayubas, and two in Sanir. On entering the country of the Sultans of Uali, Butig, and Maciu the troops were frequently fired upon. Capt. Pershing halted to send a message to the two Sultans of Maciu, who replied contemptuously. Thirty more entrenched and fortified positions were taken with a loss of only 2 wounded, although 20 Moros were killed in one engagement. As before, the Moros fell back from one fortified position to another. On Sept. 30 the column came in front of the stronghold of Maciu on the lake. The sultans boasted that it was impregnable and the Americans knew from their experience at Pandapatan that the thick high walls, bristling with native cannon and swarming with bolomen and riflemen hidden in the shrubbery on top, could not be stormed without severe losses. The approach was difficult, as the place was surrounded with swamps on the land side, which it took time to bridge so as to besiege the fort. Capt. Pershing at last disposed his men at an effective range. A final summons, with an offer of peace from Gen. Sumner, was sent to the sultans, who replied that the Americans must capture them in fight if they wanted to confer with them. They had sworn that they were willing to go with their people into slavery if the fort could be captured with them alive. The American riflemen and gunners learned to pick out the embrasures and loopholes and the marksmen on the walls by watching the puffs of smoke. Shrapnel fire, solid shot sent through the walls, and shells bursting within the fort rendered the defenders apparently helpless. The siege line was drawn closer, and Lieut. Loring led a storming party, but it was called off when an inner lower wall was found on which there were plenty of yelling Moros. The bombardment was resumed. The Sultan of Cabutatan made a desperate sortie, and was killed with all his followers, yet, pierced with six wounds, he bolooed an American. The besieged were well supplied with food and water, but the American sharpshooters and gunners killed them off, and on the night of Oct. 2, when Capt. Pershing had brought his batteries up to 100 yards and closed in the infantry lines, those who remained escaped by the usual underground passage. Besides the Sultan there were 7 Dattos and 42 other Moros killed and 50 wounded. The American loss was only 2 wounded. The attempt to form a combination among the rebellious tribes was frustrated by the thorough defeat of the Macius, though the Sultan of Bacolod still threatened war to defend the religion of Mohammed. Gen. Chaffee transferred the chief command in the Philippines on Oct. 1 to Gen. Davis, who after the return of the column to Camp Vicars ordered Gen. Sumner to delay his intended expedition against Bacolod to see the effect of Capt. Pershing's victory. This effect was marked and instantaneous. The rebellious sultans made professions of peace and offered to furnish provisions and laborers.

Civil Government.—The Philippine Commission reached the conclusion that the only possible method of instructing the Filipinos in methods of

self-government was to make a government partly of Americans and partly of Filipinos, with absolute control in American hands for some time to come. Even the educated have but a faint conception of civil liberty. In the schools the English language was made the basis of all public instruction, and the people showed a remarkable eagerness to learn English. When the normal school was opened for training Filipino teachers, 600 pupils were enrolled at once. In the night-schools 10,000 adults sought instruction. Young Filipinos were instructed in telegraphy so as to take over the telegraph service from the army. Manual training-schools and agricultural colleges were a part of the plan of education. The people of the islands were found by the Philippine Commission to be divided into three parties: one opposed entirely to the American occupation; one favoring the established government; and one, larger than both the others and composed of the ignorant mass, which was indifferent and would support any government able to restore order and tranquillity and protect the people from violence.

The Federal party asked for amnesty for political offenders and the organization of local and insular government on a basis partially popular and desired to have the Filipinos represented before the executive and legislative departments in Washington by two or three delegates. This party, which was composed of the majority of the educated people, ultimately looked forward to statehood or to political independence. Its leaders proposed to impose higher restrictions on the municipal franchise than those adopted by the Philippine Commission. This party was an efficient ally of the Government in procuring the submission of insurgents and the pacification of the country. Wherever the Philippine Commission went the Federal party prepared a favorable reception. The other active party, the one opposed to American rule, was the Conservative party, composed largely of Spanish mestizos, and having the most sympathy for the Spanish clerical hierarchy that was obnoxious to the Filipinos in general. This party was in favor of peace as well as the Federal party, and the great party that desired only peace and advanced no political views. The Conservatives wished to establish an independent native government with an American protectorate.

The Philippine Islands, owing to the influence of the friars and Spaniards owning large haciendas, had no land tax in Spanish times. The American Commission imposed one, which encountered some opposition at first. The yield can only be small at first, because out of 65,000,000 acres of agricultural land in the Philippines only 5,000,000 acres belong to private owners.

The sanitary measures taken at Manila practically stamped out the plague, which caused 20 deaths a week at the beginning of 1901, but not more than 3 on the average at its close. Small-pox is endemic in the Philippines, and vaccination was made compulsory. Beriberi, another endemic disease, has been studied with a view to curbing its propagation. A plan was formed for isolating the lepers, of whom there are believed to be 60,000 in the islands. In 1902 an epidemic of cholera raged in many towns and districts and caused fearful mortality.

On July 1 civil government was proclaimed throughout the Philippines, excepting in the southern islands of the Moros, according to the bill passed by Congress. Gen. Chaffee's powers as Military Governor-General ceased, and he became merely commanding general of the military division of the Philippines. The Philippine Govern-

ment remained under the absolute direction of the President and received instructions from the War Department. A provincial government was inaugurated at Laguna on the same date, completing the establishment of local civil rule throughout the civilized parts of the archipelago. The pacification was pronounced complete and the acceptance of American authority universal. The army was reduced to 27,000 men. Its duties were confined to police work, except in the Moros country, and it was expected to replace it eventually by a native constabulary. On July 4 a proclamation of the President announced that peace had been established and offered amnesty to all who had participated in insurrections against Spain or the United States or had been guilty of treason, sedition, or any other political crime. Pardon was granted even for acts in violation of the rules of civilized warfare in the belief that they were committed in ignorance and under orders of the revolutionary leaders, but not for such acts committed since May 1, nor for murder, rape, arson, or robbery. Those held for these crimes at common law were promised such clemency as would be consistent with justice and humanity. To political prisoners and all who had committed political crimes the only condition of a full pardon and amnesty was that they should subscribe to an oath recognizing the authority of and assuming allegiance to the United States. Aguinaldo and the other officers of the revolutionary *junta* and insurgent leaders who were in confinement took the oath and were set at liberty. The prisoners in Guam were brought back in September. In the autumn *ladrones* and irreconcilable fanatics became active in the provinces of Cavite, Rizal, and Bulacan. In Tayabas a leader named Rios with 150 bolomen attacked a town, and the constabulary, after driving them away, arrested 700 persons who were suspected of complicity with Rios, who claimed to be divine and immortal. In Samar the American constabulary suffered from attacks of robbers. *Ladrone* bands gave trouble to the constabulary in the vicinity of Manila. In Cavite a leader named Felizardo had a large following. There were several bands of from 200 to 300 in the provinces affected. When driven from Cavite, which has been the home of *ladronism* for ages, they crossed into Bulacan, and from there were chased into Rizal by volunteers. After committing depredations on the plains in the provinces surrounding Manila it was easy for the robbers to escape from the constabulary into the mountains. In November the civil authorities called for the aid of the army, which had remained inactive, and it was decided to protect the towns with military garrisons in order to release the constabulary for vigorous field operations. For the suppression of *ladronism* it was enacted early in November that highway robbery committed by three or more persons shall be a capital crime. The United States garrison for 1903 was fixed at 17,000 troops.

The Question of the Friars.—Spanish regular priests were, under the Spanish *régime*, the actual rulers of the island, the only representatives of authority with whom the Filipinos came in contact, and it was against their rule that the successive revolutions were directed. It was because their vested rights were reserved by the treaty of Paris that the insurrection against American authority gained such rapid headway and became so general. These monks, through gifts and bequests and Government grants and by confiscation and expropriation in various guises, had, in the course of ages, acquired for their establishments a large part of the best lands. When the insurrection broke out they fled to Manila for safety. The

great majority of the secular priests were natives, but the regular clergy held the important cures, all those to which an endowment or a Government stipend of any value was attached. During the insurrection the native priests, some of whom were active leaders in the revolution, settled themselves in the vacant livings. After the establishment of civil government under American auspices a large number of them, choosing Father Aglipay, one of the chiefs of the revolution, for their bishop organized what they called an Independent Catholic Church, independent of Rome, because the Curia sustained the Spanish hierarchy and monastic orders in the Philippines. Negotiations were proceeding between Gov. Taft and Mgr. Guidi for the transference to the Government of churches and the determination of what part was Government and what monastic property. The growth of the schism interrupted these negotiations, and at the beginning of 1902 led the apostolic delegate and the archbishop to appeal to the Governor-General to place the authorized priests at once in possession of the Church property with the aid of the constabulary. Bishop Aglipay and his followers, who continued to seize church property throughout the archipelago, asserted that the churches, having been built by public subscription and gratuitous labor, belonged to the people of the different towns, who had seceded from the Roman Catholic Church and joined the Independent Catholic Church. Gov. Taft considered that it was not a function of the executive, but of the judiciary, to settle the controversy, and declined to place the constabulary at the service of the Church authorities unless they appealed to the courts and obtained decrees affirming their legal ownership and rights in the disputed property. The Filipinos were not actuated by any desire to abandon the Roman Catholic faith, although some of them at one time spontaneously launched a Protestant movement, which had, however, no religious basis. Their object was not to be placed again under the authority of the Spanish monks. In June Gov. Taft went to Rome to arrange a settlement of the question with the Vatican. He presented to a commission of cardinals appointed for the negotiation a proposition of the United States Government to purchase the lands held by the friars in the Philippines at a valuation to be fixed by two commissioners representing the United States, two appointed by the Vatican, and one to be nominated by the Viceroy of India. These estates are believed to have a value of about \$10,000,000. In return for this offer the Pope was asked to recall from the Philippines within two years the friars of the Dominican, Franciscan, Augustinian, and Recoleta orders. The Vatican did not see the way to the recall of the friars within a fixed time because their rights there were guaranteed by the treaty of Paris, and such action on its part in the absence of *force majeure* would bring the Holy See into conflict with Spain; furthermore, it would be equivalent to an admission of their unworthiness. However, the Vatican promised to replace the friars little by little with clergy of other nationalities, instructing them meanwhile to occupy themselves with religion only, leaving politics alone. While willing to agree to the elimination of friars from parishes where they are really obnoxious, the Vatican trusted that the American authorities would not permit any to be kept from their religious ministrations by factious minorities. Secretary Root could not see how the recall of the friars by the spontaneous act of the highest authority of their Church could violate the engagements of the United States to Spain, or how the interest

of the United States in restoring religious peace for the welfare of the Filipinos could conflict with that of the Vatican in retaining them as faithful Roman Catholics. He pointed out that the United States sought not a forcible, but a voluntary withdrawal of certain persons who happen to be Spaniards and whose previous experiences in the islands had fortuitously thrown them into antagonistic relations with the people, the Catholic laity, and the native clergy. Many of them had left their parishes, and could not be reinstated without using material force, which the United States could not permit. Their voluntary recall by their religious superior in the interest of the whole people of the Philippines, who were bitterly opposed to their presence, which was the only motive the United States as well as the Holy See could have, would not be a violation of the treaty of Paris and could not be regarded as affirming or admitting any accusations against the friars, because the American Government made no such accusations. Besides the purchase of lands held by the religious congregations or their representatives at a price to be fixed by a tribunal of arbitration the United States offered to settle by agreement or arbitration indemnities to be paid for the use of churches and rectories by American troops during the insurrection and to convey to the Vatican the sites of churches and rectories to which the Vatican has no legal title, while charitable institutions and public trusts would be divided, by arbitration if necessary, between the Church and the Government according as their character or origin justifies their administration by the ecclesiastical or the civil authorities. Cardinal Rampolla accepted the offer for the purchase of the monastic estates, suggesting that the fifth commissioner to appraise their value be selected by the four others. This offer was withdrawn, since the main proposal, that of the gradual withdrawal of the friars within two years, was rejected. Gov. Taft left Rome to continue the negotiations later with the apostolic delegate to be appointed to Manila. The money that the United States may pay for the friars' lands and for indemnities is very necessary to the Church in the islands, as the Philippine Government does not pay stipends to the clergy, as it did under the Spaniards, when every friar in charge of a parish received from \$600 to \$1,500 Mexican a year. Secretary Root requested the Vatican to send to Manila lists of the property claimed as belonging to the Church and to the religious congregations, with proofs of title. The lands formerly controlled by the friars are now tenanted by Filipinos, who no longer give any returns to them in rent or services. A small number of friars have remained in their parishes and continue to minister acceptably to the Filipinos. The Church authorities were asked by Mr. Root to furnish full and definite lists, first, of the property the congregations claim to own and desire to sell, with the precise relations they hold to the title; second, of details of damages done by troops to churches and convents, and of indemnities claimed; third, of Church properties to which formal title remained in the Spanish Crown at the time of its cession; fourth, of charitable and educational trusts which it is said devolve on the Church rather than on the state.

PHYSICS, PROGRESS OF, IN 1902. Cosmogony.—S. Arrhenius, in *Archives Néerlandaises*, 6, 1901, endeavors to infer from natural laws that the universe has continued materially unchanged for an indefinite time, and that it will so continue indefinitely in the future. He shows that for the bulk of existing gaseous matter

contraction to one-eighth of its volume, with corresponding increase of pressure, will initiate a loss of heat by radiation, while the mass continues to rise in temperature. If the pressure increases more rapidly than in the ratio of 16 to 1, a second stage will be reached in which the mass will be cooled by contraction. With hydrogen and nitrogen, Amagat has shown that this will occur (at pressures of more than 250 to 300 atmospheres) at about 17° C. The densities of the nebulae are much less than this, so that if they lose heat by radiation, their temperatures will increase more rapidly, and therefore, conversely, the communication of heat from outside will cause cooling accompanied by expansion. This expansion would continue indefinitely if it were not for comets and meteorites. When new stars begin to form a solid crust, the loss of energy will fall suddenly, and this third stage will therefore continue indefinitely. With bodies in the second and third stages collisions will give rise to explosive outbursts of gases, and these would form spiral nebulae. The author points out that there will be practically no dissipation of gravitational energy during expansion, and none through ordinary chemical dissociation. There will be dissipation, however, in photochemical processes inverse to those which occur on the surface of the earth, and the series of changes may go on without intermission. The average period of the cyclical changes is on the increase, so that the quantity of nebulous material in existence must continually become greater, while that of the stars must correspondingly decrease.

Properties of Matter, etc. Gravitation.—V. Wellman (*Astrophysical Journal*, May) attempts to explain the Newtonian law of gravitation by supposing a gaseous ether of extreme tenuity, whose particles possess velocities approaching that of light. On this supposition gravitation must be modified if the attracting masses are in relative motion. The modifying factor involves the velocity of the ether particles, which the author assumes to be equal to that of light *in vacuo*. The resulting "gravitation factor" agrees with the constant of Gauss so closely that "a merely accidental coincidence of the two values is out of the question, and a causal connection between light and gravitation seems to be expressed in the figures." The distribution of what he calls "gravitational matter" is discussed by Lord Kelvin in a British Association paper (*Nature*, Oct. 24, 1901). Ether, according to Lord Kelvin, is matter, but not gravitational matter, because if it gravitates it must be infinitely incompressible, which to the author appears improbable. It is assumed that the Newtonian law of attraction between masses of gravitational matter holds throughout infinite interstellar space. The author considers it probable that there may be as much matter as a thousand million suns within a sphere of radius 3.09×10^{16} kilometers (the distance at which a star's parallax is 0.001 of a second), because, if uniformly distributed at rest throughout such a space, twenty-five million years ago, they would now have acquired, by mutual attraction, velocities comparable to the present velocities of the stars. Kelvin also states that if all the matter in the universe were, at a certain epoch, at rest, and unequally distributed, there would be a tendency for the densities to become more unequal, solid bodies would ultimately form, and there would be collisions, giving rise to waves in ether, carrying energy away to infinite space. The origin of meteoric stones is attributed to this kind of cooling.

The Ether.—Hopkinson (*Philosophical Magazine*, January) argues that optical and other terrestrial phenomena, including gravity, fail, with one exception, to give any logical non-metaphysical basis for postulating the existence of an ether. This one exception is the fact that, according to the undulatory theory, the aberration of a star depends on the motion of the earth relative to the free ether, and is entirely unaffected by the motion of the star, which, if capable of experimental proof, would give such a logical basis. Certain stars, the so-called "spectroscopic binaries," appear single when viewed through a telescope, but are inferred to consist of two components because of the periodic doubling of lines in their spectra. This would occur, owing to the Doppler effect, when one component of the system is moving toward, and the other away from, the earth. If the motion of the components affected their aberration, then, when moving as above, there should be a lateral separation between the components as seen in a telescope, resulting in a periodic doubling alternating with the separation of the spectroscopic lines. The fact that no such doubling can be detected affords, in the author's opinion, evidence that the aberration is unaffected by the motion of the star, and gives a logical basis for postulating an ether.

Molecular Fields of Force.—S. Leduc (*Comptes Rendus*, Feb. 17) has attempted to explain a number of phenomena by applying the notion of fields of force to molecular movements in liquids. When a drop of any aqueous solution falls into distilled water the dissolved molecules diffuse in all directions and water moves in an opposite direction to replace them. The drop is then the seat of a field of force, the directions followed by the moving molecules being the force lines. A similar but inverse field is established when a crystal forms in a solution. By retarding the molecular movements by a colloid such as gelatin, and drying the liquids rapidly, photographs of the molecular fields of force have been obtained, exhibiting also interference between fields of force of diffusion, or between fields of force of diffusion and crystallization.

Mechanics. Pressure of Vibrations.—Lord Rayleigh (*Philosophical Magazine*, March) gives several examples to show how the energy of a vibrating system may be drawn off and converted into other forms of work. In one of these, a string is attached at its upper end to a vertical axis, and a ring slides over the axis, including the upper part of the string, the lower part being free. To the lower end is attached a pendulum, which, when set swinging, tends to force the ring upward, any work done in raising it being at the expense of the vibration energy. By mathematical calculation it may be found that raising the ring to an infinite distance would exhaust the whole energy of vibration. The author raises the question whether an analogue of the second law of thermodynamics can be found in the general theory of the pressure of vibrations, but does not give, apparently, a final answer.

Measurement of Minute Masses.—E. Salvioni (*Nuovo Cimento*, May) has devised a microbalance, made of a thin thread or ribbon of glass or other material, fixed at one end. The device is placed in a closed case, which also contains small weights (the larger of platinum wire, the smaller of silk thread), which can be placed on the flexible thread or ribbon. The bending of the loaded thread is observed with a micrometer, and appears to be proportional to the weight. A glass thread 10 centimeters long and one- to two-tenths of a millimeter in diameter will thus support a weight

of more than 100 milligrams, and will serve to weigh to one-thousandth of a milligram. The balance has an arrangement that maintains the flexure after unloading. The loss of weight of musk by volatilization is clearly demonstrated by this instrument, which shows it to be proportional to the time.

Density.—G. Guglielmo (Atti dei Lincei, Dec. 1, 1901) describes a balance used under water to determine densities. As the weight in water can be made small, the friction on the knife-edges is small, and these are, moreover, lubricated by the water. The balance is thus of extraordinary delicacy, and the error due to surface tension on the suspending wire is also avoided. The balance arm is of glass, with a central bulb to give the whole suitable weight. The knife-edges of the ordinary balance are replaced by points resting on planes.

Strain.—L. Cailletet (Comptes Rendus, Feb. 17) notes that a thick coating of strong glue spread upon glass splits off when it dries, pulling with it thin layers of the glass, and leaving a decorative curved pattern, especially if crystalline salts are added to the glue. A cylindrical vase of thin glass so treated will split into a hemicylinder, and a thick piece of glass will, under polarized light, show the contractile strain to which it is subjected.

Torsion.—Coker (Edinburgh Royal Society, Nov. 12, 1901) has studied turned steel bars about one-half inch in diameter, under torsion, together with tension and bending. Such experiment has generally been limited hitherto to wires. According to the usual theory, if the material changes from the elastic to the plastic condition at the yield-point, the maximum torque which the bar will stand, when it is all plastic and subject to the same shearing stress, is four-thirds the value at which the first marked deviation from perfect elasticity occurs. With an iron bar, the deviation occurred at 375 inch-pounds and failure at 525 inch-pounds, the ratio being 1.4; a steel specimen gave 675 and 870, a ratio of 1.29. The phenomenon of breakdown and subsequent recovery from over-strain is similar in torsion to that in tension, such a moderate heating as 100° C. having a marked effect in promoting the recovery. The experiments demonstrate that the limits of elasticity do not remain in their original positions; stress carried beyond the elastic limit in one direction reduces the other limit to zero. The theory that a twisted bar is twice as strong to resist torsion in the same direction as in the opposite one is not borne out by experiment. As for the effect of tension on torsion, a tension within the elastic limit has practically no effect on the elastic part of the torsion curve, but lowers the yield-point. The effect of torsion on tension was only examined below the elastic limit. No difference was observable, whether the bar were twisted or not, provided its elasticity remained unimpaired. When a bar was bent within the elastic limit, and tested by twisting beyond that limit, its yield-point was considerably lowered, and the effect was to give the bar a permanent set in bending under the same moment to which it had previously been elastic.

Cyclonic Motion.—J. Aitken (ibid., 40, 1, 1901) notes that vortices will not occur either in air or water unless there is initial circular motion as well as low pressure. Otherwise the fluid will flow toward the low-pressure center radially. This may be illustrated by emptying a basin of water from an orifice at its lowest point. In water vortices so formed there is a great increase in velocity near the center. The resistance of-

fered in the case of a cyclone by the spirally moving air enables the latter to develop more energy than if the air moved inward radially, as the retardation causes a fall of pressure, and the energy of the cyclone is increased.

Liquids. Solution.—Friedländer (Zeitschrift für physikalische Chemie, Oct. 1, 1901) has observed certain peculiarities of partially miscible liquids near the critical point, using chiefly mixtures of water and isobutyric acid. The temperature coefficient of internal friction increases very greatly in the neighborhood of the critical point, not only with these substances, but also with mixtures of phenol and water, and with benzene, water, and acetic acid. Precisely similar results were obtained on studying the opalescence or milkiness that appears when such mixed liquids are cooled near the critical point. In mixtures of isobutyric acid and water the opalescence reached a maximum of 69 units for a critical mixture 0.04° C. above the critical temperature, and falling to 4.5 units at a temperature 1° above. The density, coefficient of expansion, electrical conductivity, and refractive index of the solutions, however, change continuously in the neighborhood of the critical point, and do not exhibit maxima or any other abnormal features.

Wave Motion.—W. G. Fraser (Philosophical Magazine, October, 1901) has sought to explain the fact that large waves instead of being reflected at an obstacle, as a small wave is, and as all waves should be, according to theory, break into spray. His explanation is that the vertical component of velocity is checked by the obstacle, which tends to produce variation of density, and finally breach of continuity. For deep waves with direct incidence it is found that cohesion will prevent rupture so long as the ratio of the amplitude to the wave-length is small. In the case of oblique incidence not only the vertical component of velocity, but also the horizontal component parallel to the obstacle is checked, and this somewhat lessens the liability to break.

Composition.—G. F. Stradling (Franklin Institute Journal, October, 1901) elaborates Röntgen's theory that water contains two kinds of molecules, which he designates "ice molecules" and "molecules of the second kind." This has already been worked out quantitatively by Sutherland, and promises to explain many points in which water behaves oddly, such as the well-known maximum density at 4° C.; the minimum of compressibility at 63° C.; the decrease by increasing pressure of the coefficient of thermal expansion; the lowering by increased pressure, and by dissolved salts, of the temperature of maximum density; the influence of pressure and temperature on its viscosity; the decrease of volume in preparing aqueous solutions; and the low specific heat of solutions as compared with water. The author says: "Not only in the matter of solutions, but in other more strictly physical relations, it is a misfortune that the rôle of the typical liquid was assigned to water."

Flow.—H. T. Barnes and E. G. Coker (Physical Review, 12, 1901) have continued the investigations of the former author on the flow of liquids. Barnes showed that if water be heated while flowing through tubes in parallel stream-lines, the distribution of heat is not uniform; where the heat is applied to the outside only a few layers of the water will be heated, and where the heat is from a central wire the hot water flows only along the wire. Beyond the critical velocity, where the flow is eddying and sinuous, the distribution of heat throughout the water-column is uniform. The authors now find that the critical velocity can

be sharply determined by placing the bulb of a sensitive mercury thermometer in the water just as it emerges from the tube; when the motion becomes sinuous, even for an instant, the mercury column shoots up.

Surface-Tension.—The surface-tensions of mixed liquids have been investigated by W. H. Whatmough (*Zeitschrift für physikalische Chemie*, Dec. 5, 1901), who has made his measurements by determining the pressure necessary to drive a stream of air-bubbles through a capillary point immersed in the liquid. He finds that under certain conditions the method is capable of exceedingly great accuracy. This experimenter was unable to confirm the results of Quincke and Harnack, who found a difference in the surface-tension of freshly prepared solutions and those that have been kept some time. The maximum deviation observed by Whatmough after twenty-four hours in six solutions was only 0.1 per cent. Mixtures of sulfuric acid and water were found to exhibit a remarkable maximum of surface-tension at 46 per cent. H_2SO_4 , corresponding with a minimum of compressibility. Minima occur in mixtures of acetic acid with ethyl iodide, carbon tetrachloride, benzene and chloroform, toluene with xylene, and other mixtures of hydrocarbons.

Viscosity.—A. Batschinski (Moscow Imperial Society of Natural History, *Bulletins* 1 and 2, 1901) has tested the law that the product of the internal friction of a liquid and the third power of the absolute temperature is a constant. He finds that the relation holds with a large number of substances, including bromine, nitrogen-dioxide, most halogen derivatives, and certain aldehydes and ethers; but anhydrides, acids, alcohols, and water (below its boiling-point) in general do not obey the law. P. Duhem (*Comptes Rendus*, May 12) defines a fluid as a body, each element of which is in a state completely defined by the temperature and the density. Within an incompressible fluid the virtual work of viscosity is zero, and if a body is rigorously fluid and rigorously incompressible, it must be considered devoid of viscosity. All viscous fluids are compressible. The author shows that the laws of motion of a viscous fluid differ from those of a non-viscous only in that there is no longer a relation in finite terms between the pressure, temperature, and density, such relation being replaced by a differential equation. For a compressible perfect fluid the density at any point has the same value as if the fluid were in equilibrium under the same pressure and temperature; while for a viscous fluid in motion the density at each point varies in such a sense as to approach that value. In a slightly viscous fluid, where the velocity varies little, these two values are very nearly equal, and thus a perfect fluid is the limiting form of a fluid slightly viscous. The same author, in a later paper (*ibid.*, June 2), extends these considerations to a fluid near the critical state. It is shown that while the density differs by a finite amount from the equilibrium value, the density of an element may vary very slowly. The fluid is thus in quasi-equilibrium, but such a state is not permanent. In a fluid with sensible motion, if the accelerations are large the rate of variation of density is no longer very small, and a stirred fluid near its critical state thus presents the same problem as that of a dissolved substance diffusing slowly through the solvent. The striæ in a fluid near the critical point are thus similar to the motions in a solution having great differences of concentration at different points.

Gelatinization.—J. M. van Bemmelen (*Archives Néerlandaises*, 6, 1901), has shown that silica jelly

really consists of an open microscopic network, or mass of polygonal cells, enclosing a large quantity of water, which is not in chemical combination, and can be replaced by other liquids. When slowly dried at ordinary temperatures, the jelly at a certain point, called by the author the "change-point," loses transparency because air enters the cells and condenses there, but it becomes clear again when this is displaced by a liquid. The jelly may be dried till only one molecule of water to ten of silica remains, but exposure to aqueous vapor causes the cell cavities to gradually refill with water, the volume of the jelly remaining almost unchanged. The phenomena can be repeated indefinitely. The position of the change-point depends on the structure of the jelly and the constitution of the cell-walls. The power of absorption of vapors is reduced by heat, and at low redness may be entirely removed. S. Levites (*Russian Journal of Physics and Chemistry*) studies the delay of gelatinization of some colloidal bodies from an aqueous solution, produced by the addition of salts or other substances. This effect increases with the temperature, and the gelatinization process may often be wholly prevented. The author suggests that a colloid will undergo gelatinization from a salt solution more slowly, the more readily it dissolves in this solution, and striking analogies between this process and crystallization are pointed out.

Crystallization.—G. Tammann (*Annalen der Physik*, April 29) believes that the so-called "liquid crystals" are not such in reality. He points out that the existence of crystals with a displacement elasticity equal to zero would introduce a fundamental modification of the space-net theory, if it did not, indeed, require its complete abandonment. Experiments, he asserts, support the view that "liquid crystals" must really be regarded as emulsions. A. Amerio (*Nuovo Cimento*, November-December, 1901) reexamines this question of "liquid crystals" by using an apparatus similar to the ice calorimeter of Bunsen, with which he demonstrates that at the points of transformation from the clear to the turbid state there is an evolution of heat, and an absorption on the reverse change. The specific heats of the compounds examined were less in the former state. Double refraction and dichroism are properties of the turbid liquids and not due to solid particles, and the author believes that surface-tension is the determining force of the orientation, and that the droplets are not analogous to crystals. He prefers to term them simply birefractive and anisotropic liquids. P. R. Heyl (*Physical Review*, February) has inquired experimentally whether electrostatic stress might not alter the interfacial angles and density of crystals formed under its influence. Mercuric iodide, a salt sensitive to slight mechanical disturbances, was employed as indicator, but no effect was found. Hence any molecular forces called into play in a solution under electrostatic stress are not comparable with the forces of crystalline attraction.

Hydrostatic Pressure.—W. Ramsay (*Archives Néerlandaises*, 6, 1901) describes an attempt to determine whether fine-grained particles, having incessant pedetic motion in a liquid, exert hydrostatic pressure. His method was to determine the density of a colloidal solution in water first by a hydrostatic method, and then by the pycnometer. The latter is found to give a higher value, and although the difference is so small as to be comparable with the errors of observation, the author concludes that the particles by their impacts on the sinker exert hydrostatic pressure.

Gases. Boyle's Law.—Rayleigh (Philosophical Transactions, April 12) used for experiments on this law two gages, which, as determined by testing them in parallel, indicated pressures in the ratio of 1 : 0.99862. A volume of gas was taken with the pressure indicated by one of these gages, and it was then compressed till the pressure was that of the two in series, its new volume being noted. It was thus found that, to an accuracy of $\frac{1}{1000}$, air, hydrogen, oxygen, and argon obey Boyle's law at the pressures and temperatures (10° – 15° C.) of the experiments, while nitrous oxide deviates from it in having greater compressibility.

Vortex Rings.—A. Indra (Vienna Academy of Sciences, April, 1901) describes experiments with the well-known smoke ring, the box used having transparent sides. When a direct ring issues from the aperture, a conjugate ring enters the box, its rotation being in the opposite direction. Experiments with direct rings show phenomena analogous to reflection, refraction, and absorption. The author believes that vortex rings play no part in the dispersion of storm-clouds by cannon firing, since experiments shows that they can not reach a sufficient altitude. He attributes the effect to sound-waves.

Sound. Stability of Vibration.—C. Barus (Science, Sept. 13, 1901) finds that when a resonator is gradually moved toward an organ pipe, under certain conditions the following phenomena are observed: With the aperture of the resonator toward the pipe, the note rises from c'' to d'' at a distance of 1.1 centimeter. For smaller distances the note returns to the original c'' . For larger distances destructive interference occurs. If the closed end of the resonator be toward the pipe, a flattening of the note occurs. Like effects are produced if the resonator be approached to the top of the pipe instead of to the slit. The explanation is that in the vibration of a system under friction having one degree of freedom a certain amount of damping occurs. The open end of the resonator diminishes the damping to such an extent that the pitch is raised. The closed end increases the damping with contrary effect.

Air-Pressures in Brass Instruments.—E. H. Barton and S. C. Laws ([London] Physical Society, Dec. 13, 1901) have examined the relationship of the pressure of blowing to pitch, intensity, and method of fingering in several musical instruments. The following results are arrived at: (1) The louder the note the greater the pressure; (2) the higher the pitch the greater the pressure; (3) for a given intensity, the pressure is approximately proportional to the logarithm of the frequency; (4) alternative methods of fingering have practically no effect on the pressure required, pitch and intensity being kept constant; (5) the pressures for cornet and trumpet are almost the same, the same note being produced at the same intensity; the pressure for the trombone is very much greater."

Decimal Musical Scale.—A. Guillemin (Comptes Rendus, April 28) proposes to replace the octave and the comma (the usual large and small units of interval) by the savart and the millisavart, defined as follow: The savart to be the interval 10:1 (3 octaves and a major third) and the millisavart the thousandth part of this (approximately 435 to 434). With these units all calculations will be much simplified. The tempered semitone is very nearly 25 millisavarts, and the millisavart, although not appreciable directly by the ear, may be easily apprehended by the beating, at the rate of one per second, of the notes 435 and 434. It is proposed that the standard international fork should be taken as 434.3.

Heat. Thermometry.—L. Holborn (Annalen der Physik, October, 1901) has examined various substances to find one suitable for liquid expansion thermometers for temperatures as low as the boiling-point of liquid air. Petroleum ether was finally adopted, but as it is scarcely a definite substance, it is not altogether satisfactory. The ether used was distilled from a commercial sample boiling at 33° C. The authors compare petroleum thermometers with platinum thermometers, and tabulate the deviations at different temperatures on different days. O. Lummer and E. Pringsheim (Physikalische Zeitschrift, Dec. 1, 1901) find that the radiation laws can be made serviceable for temperature determinations, furnishing a new temperature scale, which is identical at low temperatures with the usual gas thermometer scale, but can be utilized at much higher temperatures than the method of the gas thermometer permits of. F. Kurlbaum (Physikalische Zeitschrift, Feb. 1) employs an optical pyrometer devised by Holborn and himself to measure the temperature of flames. An image of the flame is formed on the filament of a glow-lamp, and the latter is heated by a current until it ceases to be visible through red glass. This method gives lower estimates of temperatures than Lummer and Pringsheim's (for example, $1,431^{\circ}$ C. for a candle instead of $1,582^{\circ}$). It can only be employed when the luminous carbon particles in the flame are not surrounded by absorbent gases. A. Job (Comptes Rendus, Jan. 6) describes a method of utilizing the viscosity of a gas in thermometry—a suggestion due to Barus and Callender. A 15-per-cent. solution of soda is placed in a bottle in whose stopper are three holes—two for electrodes, and one to allow electrolytic gas to escape. This gas passes through a fine porcelain tube, in which lies a platinum wire. If the tube is placed in a furnace, the viscosity of the gas decreases and the volume escaping increases. The relation between the temperature and the pressure of the gas on entering the porcelain tube is a linear one, and the former can therefore be ascertained by reading the latter by a sensitive manometer, calibrated by comparison with a known thermometer.

Radiation.—Compan (Comptes Rendus, Nov. 18, 1901), in order to investigate the laws of radiation at low temperatures, experimented on the cooling of a ball of copper 2 centimeters in diameter, blackened and of maximum emissive power, suspended in a glass globe, the pressure in which could be increased or diminished at pleasure. The vacuum in the globe being first of all pushed to its extreme limit, the ball was heated without removing it by projecting on it, by means of a lens, the positive crater of an electric arc. In this way its temperature could be raised above 320° . The globe was plunged in a freezing mixture, and the rate of cooling was measured thermoelectrically with different ranges of temperature between 302° and -182.5° , the values obtained being compared with the formulæ that express the laws of Dulong and Petit, of Stefan, and of Weber. The first of these laws was found to apply only from 0° to 200° . That of Stefan agrees fairly well from the temperature of liquid air up to 302° , yet it is somewhat too high above 150° . Weber's law applies well only from 100° to 302° .

Mechanical Equivalent.—H. T. Barnes (Electrician, 45, p. 969, 1900) has redetermined the mechanical equivalent of heat by imparting electrical energy to a constant stream of water, so as to give a steady difference of temperature at its ends. He finds the equivalent to be 4.18876 joules—a result about 0.132 per cent. higher than those that Rey-

nolds and Moorby obtained by direct mechanical means. The difference is ascribed to the electromotive force of the Clark cell, to which the electrical measurements were referred.

Relation between Temperature and Pressure.—According to the hypotheses of Poynting and Ostwald, this relation for a two-phase one component solid-liquid system varies according as the melt can or can not flow freely away. Thus, according to these views, ice will melt, provided the water can escape, at much lower pressures than those corresponding to its ordinary pressure-temperature equilibrium curve. G. Tammann (*Annalen der Physik*, December, 1901) tests these views by measurements of the plasticity of ice, phosphorus, naphthalene, and piperine, and states that the hypotheses above mentioned are untrue. With ice and white phosphorus the plasticity increases rapidly with the force and the temperature, while with the other substances there is a maximum of plasticity as the pressure increases at certain temperatures.

Change of State.—J. E. Mills (*Journal of Physics and Chemistry*, April) concludes that the total energy *per se* of a molecule must be the same in the liquid as in the gaseous state at the same temperature, and he thus believes that in general the energy required to change a liquid into gas is spent in overcoming the external pressure and in altering the distance apart of the molecules. Assuming that the attraction between the molecules varies inversely as the square of their distance apart, he deduces a formula that affords a means of testing the above assumption. The results are favorable to it and also show that the absolute molecular attraction is only slightly affected by changes in temperature, as it depends primarily on the chemical constitution of the molecule and not upon its mass.

Specific Heat.—Ponsot (*Comptes Rendus*, March 24), from discussion of a gaseous homogeneous mixture of bodies in chemical equilibrium, deduces the general law that at absolute zero two systems of solid bodies comprising the same elements have the same specific heat. The specific heat of a compound in the solid state is thus equal to the sum of the specific heats of its separate elements in that state. The specific heat of a solid body and that of its saturated vapor both tend toward zero for absolute zero of temperature.

Light. Nature of White Light.—M. Planck (*Annalen der Physik*, February) considers that the two apparently contradictory views of Gouy and Carvallo on this subject may not be incompatible. The necessary feature is not the existence of interference of partials, but its regularity. The author concludes that normal white light of constant intensity is completely defined by the energy distribution in the various parts of the spectrum, and by the law that, within a small part of the spectrum in which the energy distribution may be considered uniform, the energies and phase constants of the single simple periodic partials into which the light vector can be broken up are absolutely irregular.

Velocity.—Cornu throws doubt upon the trustworthiness of results obtained by the revolving-mirror method of measuring the velocity of light, on the grounds (1) that the mirror may be expected to drag the beam with it, and thus make the deduced velocity too small; (2) that the beam incident on the fixed mirror moves across it with a velocity comparable to that of light; (3) that the aerial vortex around the revolving mirror may modify the path of the rays. H. A. Lorentz (*Archives Néerlandaises*, 6, 1901) takes up

these criticisms one by one. As regards the first, he shows, by geometrical optics, that the effect of the rotation is to alter slightly at each instant the distance between the center of the revolving mirror and the image formed by reflection, but not to alter the direction in which this image lies. As regards (2), he calculates the velocity with which the beam traverses the fixed mirror, and maintains that, even if much greater, it would not affect the directions of the reflected rays. As regards (3), the author maintains that as the vortex is symmetrically distributed round the axis of revolution it will not tend either to advance or retard the direction of either the incident or reflected beam. A. A. Michelson (*Philosophical Magazine*, March) discusses the accepted values of the velocity of light, the ratio of the two electrical units, and the velocity of Hertzian waves, and concludes that new determinations are necessary for accuracy. A new method free from the drawbacks of previous ones would be virtually a combination of the Foucault and Fizeau methods. Light passes from a slit through a lightly silvered glass-plate and a lens and falls on the upper half of a revolving mirror. It is reflected to a grating which reflects to the lower half of the mirror, and the beam passes by way of a lens to the distant mirror. The author hopes that the velocity may thus be measured to within about 5 kilometers.

Absorption.—G. E. Hale (*Astrophysical Journal*, April) believes that selective, like general absorption, is a function of wave-length. In his photographs of the spark spectrum of iron in water the reversals first appear at the more refrangible end of the spectrum, and as the conditions become more favorable, lines of greater wave-length are reversed. Similar results were obtained with other metals. This is interesting in view of Campbell's discovery that in the spectra of certain stars the ultra-violet lines of hydrogen are dark, while those of greater wave-length are bright, which may be explained on the assumption that the law of selective absorption resembles that of general absorption. E. Hagen and H. Rubens (*German Physical Society*, March 7) have examined the infra-red, visible and ultra-violet rays from an arc lamp, before and after interposition of chemically deposited metallic films, by means of a special spectroscope. For equal thicknesses gold is the most transparent to visible rays, platinum the most absorbent. At its maximum transparency silver is 1,200 times as transparent as platinum. The sequence of the metals as regards absorption is the same as for electric conductivity. R. S. Clay (*Royal Society*, London, Nov. 8, 1901) finds that in the production of color by successive absorption, the loss of light proceeds by geometrical progression, not by successive subtraction. This, he says, is important in "process" three-color printing, where the inks are always printed full strength, and the tint is regulated by the size of the dots. "It is practically impossible to control the relative placing of dots of different colors. This will be immaterial if the spectral absorption regions of the three inks do not overlap, but if they do overlap, then where dots of different colors coincide there will be blackness, and the coloring will only be correct when the dots fall clear of one another. Further reasons for using inks with abrupt absorption are that the colors will be purer, and that variation in the amount of ink from impression to impression will not be so important, thus avoiding a great practical difficulty." To make the luminosities balance, Mr.

Clay finds that the absorption band of the green-absorbing ink should be a good deal narrower than the region covered by the green sensation. Thus the tints of the inks will not be truly complementary to the three-color sensations.

Spectroscopy.—E. L. Nichols (Physical Review, August and September, 1901) has compared the visible radiation from incandescent carbon-rods *in vacuo* with the radiation from an acetylene flame, by means of a spectrophotometer. Since the radiation in both cases is from incandescent carbon, it was anticipated that similarity would be found in the two spectra. This anticipation, however, was far from being realized. The distribution of energy in the spectrum of the carbon rod, instead of approaching that of the acetylene flame, as the temperature of the rod is increased, assumes an entirely unexpected character. Even at low temperatures the change in the spectrum is not simple, and after passing $1,100^\circ$ the energy in the yellow, which from the beginning increases at a relatively more rapid rate than either the red or the blue, becomes unexpectedly great. G. Laubenthal (Annalen der Physik, April 8) has measured in various ways the bands in the absorption spectra of the lakes formed by alkanin and certain metallic salt solutions. In each of the two groups studied the bands shift toward the red with increasing atomic weights, in such wise that the ratio between the wave-lengths of the two bands of each spectrum is constant for each group of metals. If the wave-lengths of the absorption bands are plotted against atomic weights, the curves have almost identical shapes with those given in Ramage's paper on the emission spectra of the same groups of metals (London Royal Society, May 12). In both there is a break between sodium and potassium, and probably a similar break in the beryllium to calcium curve. This is interesting as correlating absorption spectra with emission spectra, and also the densities and melting-points, as having their origin in the same fundamental cause. J. Jeans (Philosophical Magazine, November, 1901) advances the following hypotheses concerning the structure of molecules and atoms to explain the phenomena observed in the spectroscopes. If each vibrating element of a gas were capable of rotation about an axis through its center, and if that axis were itself rotating, there would be in the spectrum generally only a bright line and a luminous band. If there is to be a line spectrum only, it is found that the secondary vibration must be small compared with the primary. From considerations of the law of equal partition of energy Jeans concludes that the atom, and not the molecule, is the vibrator, except in monatomic gases. He infers that in all gases giving line spectra the vibrating parts are dissociated atoms, approximately spherical, which would explain why pure line spectra are given only by elements. The atom is supposed by Jeans to consist of a great number of point electric charges arranged in spherical shells of alternate signs. The outer shell is assumed to be always negative, to account for the greater importance of negative ions, as shown by Zeeman and others. Incidentally the calculations lead to an estimate of the size of an atom, namely, the radius of an atom of atomic weight n should be, at least as regards order of magnitude $n^{1/3}10^{-8}$ centimeter. The molecule, which is a combination of atoms, is defined by Jeans as a system of ions of which the total charge is zero. It follows that no free ions can be liberated by chemical change, and that the force exerted by a molecule at external points falls off very rapidly with the distance. Each

molecule will have, generally, a rotational vibration about an axis, which will emit electromagnetic waves. Under certain circumstances this may be converted into continuous rotation, the atom or molecule thus becoming a permanent magnet.

Refraction.—B. V. Hill (ibid., November, 1901) has further investigated the property of dilute solutions of gelatin and gum-arabic by which when strained they become doubly refracting. The dilute jellies were placed in thin brass tubes closed by glass plates at the ends, and were strained by squeezing the tubes between clamps so that their cross-section was elliptical. The double refraction first increases with the compression, then remains stationary, and finally diminishes. The solutions thus behave like solids that can sustain only a small amount of strain. G. Kucera and C. Forch (Physikalische Zeitschrift, Jan. 1), having in mind the fact that the dielectric constant of a liquid decreases with the temperature, but in a different manner for different substances, have studied the temperature variation of the refractive index, which should be connected with the dielectric constant by Maxwell's law. The liquid is enclosed in a prism whose refracting edge is horizontal, and is then placed in a freezing mixture, where its refractive index is measured by total reflection. The results show that the refractive index, n , may be calculated from formulæ of the form $n = a + bt + ct^2$, where for alcohols a varies between 1.34 and 1.42 and b from 0.00046 to 0.000596. For carbon disulfid, $n = 1.64362 - 0.000733t + 0.000009t^2$. P. Zeeman (Archives Néerlandaises, 4, 1901) has determined the optical constants of platinum up to 200° to decide certain questions in dispute. Kundt found that the index of refraction of platinum increases by about 27 per cent. for a temperature rise of 100° , while Drude found for platinum, silver, and gold only very small variations. The author finds very small effects. F. Pockels (Annalen der Physik, April 8) has experimented on the effect of deformation on the optical properties of glass, and arrives at the following conclusions: (1) Double refraction due to thrust is negative for most glasses, but positive for flint glasses containing much lead. It should thus be possible to make a flint glass having no double refraction for light of a certain wave-length. Dispersion due to mechanical thrust is considerable only in the heaviest flint glasses. (2) Change of index, absolute or relative, due to hydrostatic compression increases with the density and index, but does not agree with any formulæ which have been put forward. (3) The pure temperature coefficient of the index (the result obtained by subtracting the portion of the coefficient due to change of density) is positive and increases rapidly with the percentage of lead. (4) Dispersion may either increase or decrease as the pure temperature coefficient increases.

Fluorescence.—Chaumet (Comptes Rendus, May 20) finds that the well-known fluorescence of the diamond in violet light is intimately related to its brilliancy in artificial light, especially candle-light. The most brilliant stones are those which are most clearly fluorescent in violet light; they exhibit a clear blue, very luminous fluorescence, while less brilliant diamonds simply assume a violet color. A brilliant yellow diamond when placed in violet light for a few minutes shone vivid red, and its color changed to dull brown, but it recovered color and brilliancy in twenty-four hours. The action of violet light also distinguishes the rubies of Siam, which exhibit

a scarcely appreciable fluorescence, from the greatly inferior rubies of Burma, which are very fluorescent and gleam brilliant red. W. Voigt (*Archives Néerlandaises*, 6, 1901) states that while a complete theory of fluorescence and phosphorescence on the electron hypothesis is at present impossible, owing to our scanty knowledge of the internal constitution of molecules, we may be able, by the aid of experimental results, to obtain certain generalizations. The author considers the two phenomena to be caused by irregular vibrations due indirectly to the incident light, although not directly excited by it. Free negative electrons would be more susceptible than the more massive portions of the molecules, and it might be assumed, therefore, that the latter are indirectly set in vibration by the former. It is more probable, however, that the molecules of a fluorescent substance can exist in two or more distinct states, to which correspond distinct intrinsic periods of the electrons. In such a medium, if there is sensibly less damping in the state corresponding to the longer period of the electrons, there will be sensible fluorescence, and in the other sensible absorption.

Colors of Films.—R. W. Wood (*Philosophical Magazine*, April) has made "metallic deposits on glass, which the microscope shows to be made up of particles smaller than the wave-lengths of light, and which by transmitted light exhibit colors quite as brilliant as those produced by aniline dyes." The deposits are obtained by heating fragments of the alkali metals in exhausted and sealed glass bulbs. Some of the more transparent films, examined microscopically, were seen to be composed of barely visible particles, lying close together. When air is admitted the color vanishes, but hydrogen has no effect. The diameter of the particles varies from 0.0003 to 0.0002 millimeters. The investigator finds that while coarse particles diffract or scatter the light, closely packed minute particles reflect those wave-lengths absent in the transmitted light, and minute particles far apart diffuse light of the same wave-lengths as those which are, to some extent, absent in the transmitted light. Heating and cooling both shift the absorption region of the spectrum in the direction of greater wave-lengths, but the effect due to cooling is temporary. A pale-green film becomes deep violet when cooled. In some films change and return of color may be effected by blowing, and then rubbing with the finger. The films are practically non-conductors of electricity, and the author suspects the phenomena to be due to a kind of electrical resonance.

Reversible Actions.—E. Goldstein (*German Physical Society*, 3, 14, 1901) finds that colors produced in glass by cathode rays are destroyed by ultra-violet light or by sunlight, and that changes produced by ultra-violet light are reversed by waves of greater length. The colors can also be destroyed by heating. Bromide of silver blackened by cathode rays and afterward exposed to sunlight in a closed tube for three-quarters of an hour has its original color entirely restored, except at the illuminated surface. In diffused light this result is reached in about two days, and with chlorid of silver months are required. Iodid of silver blackens and liberates iodine under cathode rays; but a few days' daylight regenerates the yellow iodid and a few seconds under the positive light of the discharge will do the same if the blackened iodid be warmed.

Action on Metallic Surfaces.—H. Buisson (*Journal de Physique*, October, 1901, and *Eclair Electrique*, Oct. 5, 1901) finds that when a metallic

surface is illuminated by sunlight, the rate of loss of negative electric charge steadily falls, until at length it ceases. In the dark this change to an insensitive condition does not occur, and the sensitiveness of a fresh surface is increased by keeping it in darkness. Under the same radiations, a metal becomes more negative by from 0.10 to 0.14 volt, with the exceptions of nickel, which is very slightly affected, and platinum, which is oppositely affected. This modification disappears gradually and completely in the dark, and under the continued action of light it reaches a limit after a few minutes. The change produced by light is superficial, the layer affected not being even thick enough to alter the polarization of a reflected beam. Probably the change is determined by an equilibrium between the surface of the metal and the adhering film of gas.

Radio-activity. (See also *Röntgen Rays* under *ELECTRICITY*.)—W. Crookes (*London Royal Society*, March 21) asserts that electrons from radio-active bodies are impeded by the molecules of the surrounding medium like material particles, while ether waves are not thus affected, except by absorption. Actinium and radium are found by the author to give electrons similar to a fog or mist. When not kept in by a thick metal screen, this diffuses away in the free air like odoriferous particles. Polonium, however, behaves somewhat differently. Radium emanation may be removed by a current of air. It will pass through aluminum and a considerable length of air, and then affect a sensitive film, but polonium differs here also in its action. Corpuscles from polonium may be heavy positive ions, and the author is now making experiments to test this inference. From a negative silver pole in a tube of very high vacuum with a perforated sheet of mica in front of it electrons shot in all directions, and, passing through the hole, formed a bright phosphorescent patch on the opposite side of the tube. After some hours silver had been deposited only on the mica screen and near the pole, while the glowing end of the tube was free of silver deposit. Electrons thus seem to have been shot off from the negative pole, causing the glass on which they impinged to phosphoresce, while at the same time the heavy positive ions of silver, freed from their negative electrons, also flew off, and were deposited near the pole. These metallic ions when deposited on a metal plate in all cases showed positive electrification, thus lending support to the view of Strutt that the non-deflectable Becquerel rays are streams of heavy positive ions. M. and Mme. Curie (*Comptes Rendus*, Jan. 13) look upon radio-activity as an atomic property of bodies. According to their latest hypothesis, each atom of a radio-active substance acts as a constant source of energy. The radiant activity seems to be rigorously the same whenever the radio-active body is brought back to the same chemical and physical state, and appears not to vary with time. Suppositions as to the origin of the energy of radio-activity group themselves round two hypotheses: (1) Each radio-active atom possesses in the condition of potential energy the energy which it sets in action; (2) the radio-active atom is a mechanism which draws at each instant from outside of itself the energy which it sends out. On the first hypothesis the potential energy should in the long run become exhausted, but the experience of years has hitherto not indicated any variation. On the second hypothesis radio-active bodies are transformers of energy. This might be taken, contrary to the principle of Carnot, from the heat of the surrounding medi-

um, which would experience cooling, or it might be furnished from radiations with which we are not acquainted or from other unknown sources. P. de Heen (*Revue Scientifique*, Aug. 10, 1901) states that nearly all foci of disturbance of the ether, such as flames, brush discharges, hot bodies, electric sparks, radio-active substances, etc., produce an emanation comparable to that of a Crookes tube; and when this reaches a surface the action is distributed on the surface just as a jet of elastic liquid would be. It is as if these foci emitted ether, which, on encountering matter of sufficiently small density, carried it along mechanically. When a thick card coated with a mixture of colophane and wax is first electrified by rubbing, then exposed to the actions under study, and finally dusted with sulfur, figures are developed which show the distribution of the charge on this plate. The charge has been driven into positions the same as those into which liquid would have been heaped up by a jet or jets. A long series of very curious experiments of this order is described under the influence of flames, brush discharges, sparks, radio-active substances, superficial chemical activity, surfaces modified by the impact of light, Röntgen rays, and incandescent bodies. As with heat, there seems to be both conduction and radiation, but the radiation originates not so much in oscillation as in emission. In electrolysis the emitted substance is matter; in Röntgen rays it is ether; and cathode and other rays seem to be intermediate forms. Ionization is a subatomic, not an atomic, phenomenon. H. Becquerel (*Comptes Rendus*, Dec. 9, 1901) has prepared by successive fractionations two varieties of uranium salts, one of which is more radio-active than uranium itself, while the other is almost inactive. After eighteen months the progressively enfeebled products thus prepared were found to be almost identical, and had regained their activity. On the other hand, the abnormally active salt was found to have become completely inactive. The author suggests that the deviable rays, identical with the cathode rays, are the cause of the emission of the non-deviable radiation, which would then be analogous to the Röntgen rays, this spontaneous emission being comparable with the evaporation from an odoriferous body. The energy would be furnished by the active body, but the loss of weight would be too feeble to be observed. There would be two kinds of particles, one about 1,000 times smaller than the other; on separating, the smaller would carry negative charges, and would attain such enormous velocities that they could pass through solids, while the larger ones would move more slowly, and behave somewhat like a gas, forming on all bodies, excepting those electrified positively, a material deposit, which would be capable of dividing itself in its turn into smaller particles. This would explain induced radio-activity, and it would be in consequence of this molecular subdivision that induced radio-activity would dissipate itself, even across an envelope of glass. The emanation which produces radio-activity must not, however, be considered as similar to an ordinary gas, for Curie has shown that equilibrium between active matter and the induced walls of an enclosure in which it is confined is a function of the quantity of active matter. There is thus no phenomenon analogous to the maximum tension of a vapor. Elster and Geitel (*Physikalische Zeitschrift*, July 6, 1901) believe that ordinary air contains a radio-active gas, since, in the presence of a negative charge, it makes other substances upon which it impinges radio-active. Certain anomalies in electrical dis-

persion in closed rooms, when bodies are introduced which have been long exposed to electrified air, are explained by them on the supposition that natural atmospheric air in contact with negatively charged bodies of any kind makes these bodies radio-active. P. Curie and A. Debierne (*Comptes Rendus*, Dec. 2, 1901) find that various solid bodies acquire induced radio-activity when placed in a closed vessel with a radio-active salt of radium, preferably in the form of an aqueous solution. This induced activity is independent of the pressure, and of the nature of the adjacent gas. Substances that become phosphorescent on exposure to light, and a few others, become luminous when placed in an activating enclosure. If a solution of an active barium salt containing a few milligrams of radium be put into a glass globe, and in another communicating with the first by a bent tube a substance such as sulfid of zinc, the latter becomes as brightly luminous as when it has just been exposed to intense light. This is due to the induced radio-activity communicated through the bent tube. This induced radio-activity of bodies placed in an enclosure depends essentially on the free space existing around them. An activating enclosure of glass is illuminated throughout, although not equally, the maximum of both light and activity being in the wider portions. E. Rutherford (*American Physical Society Bulletin* 2, 1901) finds that the excited radio-activity produced by thorium compounds is intimately connected with the power of giving off a radio-active emanation. The emanations from thorium and radium behave like radio-active gases or vapors, in that they diffuse rapidly through gases and through porous substances like cardboard. The author considers that these emanations are in some way the direct cause of excited radio-activity. The characteristic property of this form of radio-activity is that it can be confined to the cathode in a strong electric field. Probably the radio-activity is due to the transport in the electric field of positively charged carriers of some kind. The author describes experiments that support this view and shows that the carriers travel in an electric field about as fast as the positive ion. F. Henning (*Annalen der Physik*, March) imparted induced radio-activity to various wires and metal plates, and then measured their activity by their capacity of producing conductivity in air. One of his objects was to find the connection between the intensity of activation and the area of surface of the wires and plates. After the potential difference was raised to a certain value the increase of activity was small, though at first the activity rose rapidly in intensity as the potential difference was increased. The activity appears to be quite independent of the area of the surface with high tensions, but with small potential differences the intensity clearly increases with the surface. A condition of equilibrium appears to establish itself in which the particles or corpuscles to which the emanation is due disappear as rapidly as new ones are produced. H. Geitel (*Archives des Sciences*, February) concludes from experiment that any conductors placed in a large mass of air, on being charged negatively, become covered with a superficial layer possessing temporary radio-activity. In natural caves and in a large disused cellar the air showed a remarkable conductivity in these circumstances. In air, and in gases generally, ions may exist capable of forming combinations with the negative electrons at the surface of conductors, and this may be the primary phenomenon of radio-activity. The question arises if it is possible to combine the

negative ions of the air with the positive electrons of electrified conductors, but it has not been found possible to obtain on positive conductors layers analogous to those met with in negative conductors. T. Tommasina (*ibid.*, March) believes that the discharging action of the radioactive substance can not be adequately explained by ionization nor by emission of electrified particles. All the effects, he thinks, are to be traced to anode radiation of the undulatory type. Thus the flux from the anode arouses the cathode rays, which, on striking a metallic plate, or the glass walls of the tube, give rise to Röntgen rays; these again excite further secondary rays, and so on. All these radiations are complex, containing parts deviable by the magnetic field, parts non-deviable, rays of various penetrating powers, and so on. The author describes experiments to show that there are in the Becquerel radiation non-luminous rays which discharge electrified bodies and undergo reflection.

Electricity. Theory.—Kelvin (*Philosophical Magazine*, March) proposes a modification of the one-fluid theory, according to which the electric fluid consists of minute equal and similar atoms, which he calls *electricions*, smaller than the atoms of ponderable matter, and capable of permeating freely both the atoms and their interspaces. The atoms are assumed to be spherical, and repulsion is assumed between atoms and also between electricions, with attraction between atoms and electricions outside of them, both repulsions and attractions being according to the law of inverse squares. The attraction experienced by an electricion entering an atom undergoes no abrupt change, and decreases to zero simply as the distance from the center when the electricion is within the boundary of the atom. Corresponding suppositions can not, however, be made for the force between two overlapping atoms. The neutralizing quantum of electricions for any atom or group of atoms has the same quantity of electricity of one kind as the atom or group has of the opposite kind. On these hypotheses many of the phenomena of electricity are found to be capable of adequate explanation. E. Carvallo (*Comptes Rendus*, Jan. 20) claims to have discovered or rediscovered for bodies at rest the following laws: (1) The flux of the total electric current through any closed surface is zero. (2) The line integral of electromotive force round a closed curve is zero. He discusses the electromotive force of induction due to movement of matter, and says that in the case of conductors and electrolytes the force is equal to the velocity of matter, multiplied by the magnetic induction. M. Carvallo also claims to have extended the two fundamental equations established for bodies at rest to bodies in motion, and to have given the electrodynamic equations for bodies in motion. The equation of energy he deals with as in ordinary mechanics.

Contact Electricity.—N. Hesenius (*Russian Journal of Physics and Chemistry*, No. 1b), by extensive experiments on metal disks, shows that a polished surface is always positive to a mat surface of the same substance. This is equally true of non-metallic bodies; for instance, a plate of wood cut perpendicularly to the fibers will be negative to one cut parallel to the fibers. The author also shows that a metal will be more positive as its hardness is less. Apparent exceptions to this rule are easily explained, as by hygroscopic properties; for instance, a wet plate will be positive to a dry one. Viscid substances, or substances capable of giving off dust, will be positive to all bodies, and dust will exhibit a negative potential-difference with respect to the body it is taken

from, because its superficial density is less. The well-known fact that two pieces of quartz when struck together will shine in the dark is shown to be due to the fact that both pieces carry a positive electric charge, an almost invisible layer of dust negatively charged being interposed between them.

Conductivity.—G. di Ciommo (*Nuovo Cimento*, February) notes that the distinction between conducting and non-conducting liquids is only a matter of degree, for all liquids conduct to some extent. He finds that the resistance in mixtures can not be calculated from the respective percentages; it is generally less than would have been expected, but the divergences vary. The condition of the liquid becomes profoundly modified upon the mutual solution of two liquids. H. A. Wilson (*Philosophical Transactions*, Nov. 22, 1901), from experiments to obtain information on the variation of the conductivity of air and of salt vapors with change of temperature, concludes that Faraday's laws for the passage of electricity through liquids apply also to alkali salts in the state of vapor. This result supports the theory that the passage of electricity through salt vapors is analogous to the electrolysis of salt solutions. A. de Hemptinne (*Zeitschrift für Physikalische Chemie*, Dec. 13, 1901) has experimented on the conductivity of gaseous mixtures at the moment of explosion, using two glass tubes, joined to a T, and a galvanometer. The galvanometer is found to be noticeably deflected in mixtures of hydrogen and oxygen when the presence of air and dust favor the condensation of water vapor; the effect is much weaker when the apparatus communicates with a vacuum and when the experiments are made at temperatures above 100° C. Hardly any deflection is observed in mixtures of hydrogen and chlorine and of carbon monoxide and oxygen. The author regards explosions as instantaneous flames.

Discharge Phenomena.—G. A. Hemsalech (*Journal de Physique*, February), analyzing the work of Schuster and himself, concludes that an electric spark is produced in the following manner: The layer of air between the two electrodes is first pierced by the initial discharge; then the air near the path becomes incandescent; this is the "luminous path." Immediately afterward the space between the electrodes becomes filled with metallic vapor produced by the initial discharge; this is the "aureole." The oscillations following the initial discharge traverse this vapor and reheat it. Without self-induction the discharge is abrupt and the energy is confined chiefly to the initial discharge. K. R. Johnson (*Annalen der Physik*, 5, 1, 1901), in a discussion of the spark discharge, explains the production of a mixture of hydrogen and oxygen at the electrodes of a water-cell placed in the secondary circuit of an induction-cell as a result of oscillations set up at break. When the rise of potential at either electrode becomes great enough, the electrode becomes coated with a layer of gas, which stops the electric flow, and the difference of potential between electrode and electrolyte becomes great enough to cause a spark. The gas in the spark-gap is compared to a wall on which an enclosed gas exerts a pressure, the wall collapsing when the pressure reaches a certain value. The electric pressure required to break down the dielectric is proportional to the number of collisions on the wall—that is, to the frequency of the oscillations. A. Righi (*Atti dei Lincei*, May 4 and 31) finds that in a circuit containing a rarefied air-tube with adjustable alu-

minum electrodes, there may be produced an intermittent discharge with a sound, audible in a telephone. The pitch of the sound increases on diminishing the resistance, on increasing the number of accumulators in the battery, on diminishing the capacity of the condenser, on diminishing the distance between the electrodes in the tube, and on diminishing the pressure of air in the tube. A Bunsen flame will act like the tube if it be rendered conductive by salt vapor. The period of electric oscillations in the condenser circuit was far less than that of the sonorous oscillations. Certain pitches of sound seemed possible, others not, so that there were sudden transitions from one pitch to another; and in other cases the sound would not start spontaneously. J. Trowbridge (*Scientific American*, April 5) concludes from experiment that lightning never strikes the surface of the sea. When it seems to do so, the effect is an illusion of perspective. The author has endeavored to pass powerful sparks to the surface of water, in order to obtain a strong spectrum of water vapor, but in every case the sparks—6 inches in length, and resembling lightning discharges as far as possible—refused to strike the level surface of the water and passed to the edges of the containing vessel. He also found it difficult to pass powerful sparks from one stream of water to another, and probably lightning discharges do not pass through regions of heavy rainfall. To produce a spark under distilled water, it is necessary to use platinum wires sealed in glass tubes all but about half an inch. If these terminals are only dipped to a small depth in the water, a spark passes giving a very brilliant light resembling that of an enclosed arc-lamp, but having no lines in its spectrum. This spectrum is probably due to water vapor, and the different spectra of lightning seem to be due to different amounts of water vapor in the air.

Alternating Currents.—R. Weber (*Annalen der Physik*, November, 1901) utilizes manometric flames for studying changes in wave-form in alternating currents. In the center of the membrane of the chamber through which the gas passes on its way to the burner he places a short soft-iron cylinder in front of the laminated core of an electromagnet, and the core is polarized by being placed in contact with one end of a permanent bar magnet. The method does not give the actual wave shape, but changes in the wave shape may by its aid be rendered visible. Specimens are given of several flame pictures corresponding to different wave shapes.

Electric Convection.—Fitzgerald has suggested that a charged condenser moving edgewise through the ether should possess a magnetic field between the plates, in consequence of the motion. If, therefore, the earth is so moving, a condenser placed with its plates edgewise to the direction of the relative motion should experience a drag during charge and a forward impulse during discharge. Experiments made by F. T. Trouton (*Dublin Royal Society*, April) with a delicately suspended condenser gave only negative results. Crémieu (*Annales de Chimie et Physique*, November, 1901) has obtained results that strengthen the doubt already thrown on the existence of the electric field due to magnetic variations, and also upon the magnetic effect of electric convection. In a repetition of Prof. Rowland's work, with elimination of certain causes of error, the result was entirely negative. Rowland's and Himstedt's deviations are not due to a magnetic field produced by electric convection, but apparently to purely electrostatic causes. A

charged body in a field of magnetic variations is not subjected to any ponderomotive force, and a rotating disk does not produce, when its charge is varied, the effects of induction that a corresponding current subject to variations of the same order would produce. The same rotating disk charged in a constant manner does not produce the magnetic field of a conduction current carrying the same quantity of electricity. A. Righi (*Nuovo Cimento*, October, 1901) asserts that of the following four analogous phenomena, following on electromagnetic theory, none have yet been definitely verified by experiment: "(1) An electric charge in motion should produce a magnetic field. (2) A varying magnetic field should produce an electric field. (3) A magnetic pole in motion should produce an electric field. (4) A varying electric field should produce a magnetic field." Attempts have been made to verify the first two phenomena, but the last two have not yet been experimentally tested. The author reviews critically the various experiments made to test the truth of these supposed laws, and maintains that the second and third offer fewer difficulties than the first and fourth. He points out that the verification of any one entails the truth of all four.

Electrolysis.—E. Wilson (*Electrician*, April 18) has investigated the electrolytical effect of alternate currents, which, as such currents are employed in rail-returns for electric traction, has become of practical importance, especially in the case of lead. He finds that the diminution in weight is nearly twice as great at a low as at a high frequency, which shows that frequency plays an important part in the reaction. The effect is entirely due to the current, as plates immersed in the same electrolyte when no current is passing are only slightly discolored. R. Lorenz (*Electro-Chemist*, December, 1901) explains various phenomena of electrolysis in fused salts by an empirical formula which he also deduces from the first law of thermodynamics. According to this the counter-electromotive force in the electrolytic bath is proportional to the current yield. This is applicable to the commercial electrolytic production of potassium, sodium, and magnesium, and to the Héroult cell for the production of aluminum. It explains the increased yield obtained by cooling the cathode, and by adding certain substances; in both cases the solubility of the metal and the tendency to form the so-called "fog" are diminished, the polarization is diminished, and the current yield consequently increased. Diffusion of metal in the form of "fog" explains the results of electrolysis with diaphragms, through many of which the metal "fogs" are unable to pass.

Hall Effect.—H. A. Wilson (*Cambridge Philosophical Society Proceedings*, February) finds a very large Hall effect in the ordinary electric discharge in gases at low pressures, the electrodes being immersed in an apparently uniform positive column. The magnetic field always produces a transverse motion of the column, as if it were a flexible conductor carrying a current, and it becomes brighter along one side of the tube. The effect is proportional to the magnetic field, is probably nearly independent of the current at pressures down to 0.26 millimeter, and varies inversely as the pressure. The difference between the velocities of the negative and positive ions in the positive column is $4.95 \times 10^4 p$, where p is the pressure in millimeters of mercury. E. van Everdingen, Jr. (*Archives Néerlandaises*, 4, 1901), explains the dissymmetry of Hall's effect as due to a difference in the increase of resistance in

two principal directions, corresponding to the mean trend of the crystallographic axes of the metal (bismuth). The mean effect is not the same when an axis of symmetry lies directly between the electrodes and when it does not, owing to the state of aggregation of the bismuth. Another cause of apparent dissymmetry is the increase of resistance along the lines of force. G. Moreau (*Journal de Physique*, August, 1901) concludes from a series of experiments on films of silver and nickel that for films approaching 5×10^{-4} centimeters thickness the accepted law of the Hall effect does not apply. Apparently the outer layers of a film, to a depth of 2.5×10^{-4} centimeters, have properties differing from those of the interior. Thus the total thickness of a film is the sum of the outer layers together with the thickness of the homogeneous interior. For thin films the usual formula requires amendment so that it may express this fact.

Röntgen Rays.—P. Curie and G. Sagnac (*Journal de Physique*, January) find that secondary rays, from heavy metals struck by Röntgen rays, carry negative charges and leave positive charges on the metal. In a high vacuum these are independent of the distance, but in presence of air particles the charges dissociate the neutral electricity of the air into positive and negative particles, resembling in this property the cathode rays and the deviable radiations from radium. Röntgen rays carry no charges, while radium emits uncharged Röntgen rays and charged cathode rays mixed. It is probable that secondary rays present a similar mixture. R. K. McClung and D. McIntosh (*Philosophical Magazine*, January) have compared the absorbing power of different solutions for Röntgen rays by means of two parallel metal plates at different potentials, between which the rays were allowed to pass. A current is set up between the plates, which will be proportional to the intensity of the rays. In this way the relative amounts of rays which pass through different solutions were ascertained. The permeability of a substance was found to be the same for rays of different intensities. An increase in the amount of salt in solution produced an increase in the absorption of the rays, and in general increase of atomic weight causes increase of absorption. E. Villari (*Nuovo Cimento*, August, 1901) finds that when Röntgenized air is passed through an insulated zinc tube, and one pole of a dry pile is held near the wall of the tube at its outer end, the tube becomes strongly charged with electricity of the same sign as that of the pole, but there is no charge unless the air is Röntgenized. As the distance between the pole and the end of the tube increases the charge diminishes and practically no charge is perceptible when the distance is 30 centimeters. A screen between the tube outlet and the pole of the dry pile prevents the charging of the tube or ball. This tends to show that the air reaches the pole by diffusion, and communicates its charge to the tube, but this view is contradicted by other facts. (See also *Radio-Activity* under LIGHT.)

Hertzian Waves.—K. Wildermuth (*Annalen der Physik*, April 29) has experimented with an oscillator consisting of two spheres immersed in oil, the waves from which passed along a pair of parallel wires, which, in turn, were led through a glass vessel containing a liquid. Thus he has measured the absorption coefficients of comparatively good and bad conducting liquids. With water, sodium chlorid, and copper-sulfid solutions, using waves of a period 21×10^{-10} , the absorption coefficients are theoretically derivable

from the conductivities. Waves of a period 74×10^{-11} were more strongly absorbed by distilled water than would be expected from its conductivity. Lamotte (*Journal de Physique*, October, 1901) has studied electric waves propagated along wires proceeding from one of the ordinary oscillators, with a view to settling the question of whether electric oscillations of higher orders are present under such circumstances. He observed waves of different periods, their number being greater as the system is made longer, and among these he reports that he could distinguish two groups whose periods are comparable respectively to the period proper to the primary and to that proper to the secondary. In each of the groups the lengths of the waves form a set which tends more and more toward a harmonic series as the length of the vibrating system increases. C. Gutton (*Journal de Physique*, December, 1901) passed electric waves from a Hertz vibrator along two parallel wires which passed into a tub containing the resonator, and afterward extended for some distance within a long trough, being connected by a bridge. With first air, then water in tub and trough, the wavelengths were found to be invariable, with the resonator either in or perpendicular to the plane of the wires. But when the resonator was kept in air and the wires immersed in water the semi-wave-length was reduced from 145 centimeters in air to 17.5 centimeters in water, giving 8.3 as the refractive index of water for the waves. These experiments contradict Turpain's statement that the period of a resonator is independent of the medium in which it is immersed. C. A. Chant (*American Journal of Science*, January) has attempted to discover whether electrical oscillators with thin surfaces of metal are as efficient as similar ones made solid or with thicker skins. Oscillators of the cylindrical and of the spherical type were used, made of solid brass, solid Norway iron, copper tubing, solid electric-light carbon, sheet platinum on a wooden form, sheet silver, tinfoil on wood, gold-leaf on wood, silver-leaf on wood, copper deposited electrolytically, and silver deposited chemically on glass. The results show that, in the case of the cylindrical and spherical doublets, the various thin mantles, and even the excessively thin gold-leaf shells were as efficient as the solid metal bodies.

Coherence.—W. H. Eccles (*Electrician*, Aug. 23-30, 1901) finds, from various experiments, in opposition to the views held by several authorities, that electrical surgings, such as are produced in any circuit to which an electromotive force is abruptly applied, have no effect in producing coherence. The phenomenon, as Branly and others have maintained, is an effect of electromotive force merely. Coherence is a continuous phenomenon, and there can be no true "critical voltage." The author makes the typical coherer consist of flings free to move throughout the space of a narrow crevice, bounded at its ends by plane conducting surfaces. E. Branly (*Comptes Rendus*, May 26) has devised a coherer consisting of a steel disk with three legs ending in blunt oxidized points resting upon a polished steel disk. Decoherence is effected by a very slight tap, and there is a corresponding increase in speed. The author finds this form very regular and reliable in action, and that it will continue in working order for several months. When transmitting a message, the tripod of the coherer at the sending station is slightly raised from the lower disk by means of an auxiliary electromagnet, which prevents it from being effected by the transmitter

sparks. D. McIntosh and J. Graham-Willmore (*Electrical World and Engineer*, May 31) describe a series of experiments made to investigate a coherer effect described by A. F. Collins, as occurring in fresh brain substance. They report they were unable to obtain any evidence to show that such an effect existed. Trials were made with the brains of animals before and after death, and with a human brain quickly removed from a recently dead person. Tommasina (*Physical and Natural History Society of Geneva*, April 4, 1901) opposes Bose's theory that coherence is due to molecular distortion. He has succeeded in forming visible chains of particles suspended in petroleum between two electrodes. The dielectric particles formed chains first, and as the field increased in strength the metallic particles followed, being finally welded by minute sparks. Spontaneous decoherence is due, according to the author, to the interposition of non-conducting particles between the conducting particles.

Vacuum-Tube Phenomena.—H. Pellat (*Comptes Rendus*, Dec. 23, 1901) finds that when a long tube is laid through a magnetic field, at right angles to it, and the field is set up, not only is the anode light driven toward the strongest part of the field, but the stratifications seem to collect into the same region, and also become inclined to the axis of the tube. This crowding and slanting occurs in uniform or non-uniform, constant or variable fields, and best with fields of from 90 to 170 c.g.s. units. If the tube be put through the holes in pole-pieces made use of in rotary polarization, when there is no field the tube is between the pole-pieces filled with the anode light; but with a field of from 2,500 to 3,000 c.g.s. units the light shrinks to about one-third, and remains axial. The fact that the field is about 3 per cent. stronger along the axis between the holes than opposite the margins would explain a concentration of magnetic oxygen molecules along the axis of the tube, but would not explain the similar behavior of diamagnetic hydrogen. Possibly hydrogen may become magnetic in a Geissler tube. The same investigator in a later paper (*ibid.*, May 5) reports that when the part of a Geissler tube which is well illuminated by anode rays is placed so that the lines of a magnetic field are perpendicular to the rays, fields up to 425 c.g.s. units deviate the column and form on the wall of the tube a luminous strip which becomes thinner and more intense as the field becomes stronger. But for higher field strengths the luminous strip increases, and for strengths of 7,000 to 8,000 units the anode column once more fills the whole section of the tube almost uniformly. The resistance of the tube then becomes enormous. But if the lines of force be in the same direction as the anode rays, there is no such increase of resistance. Thus the anode stream, like the cathode stream, experiences a very large mechanical resistance perpendicular to the lines of force of an intense magnetic field, while the resistance to its progress in the direction of these lines of force is feeble. In the latter case, with the ends of the tube inserted into holes in the pole-pieces, the anode column becomes narrowed into a thin cylinder occupying only the axis of the tube, which is explained by the result noted above. J. B. B. Burke (*Philosophical Magazine*, 1, 342 and 455, 1901) finds that between certain limits of pressure, which vary for different gases, a brilliant phosphorescence follows the passage of the ring discharge in an electrodeless vacuum-tube, and lasts sometimes for one or two minutes. The author believes this glow to consist "of glowing particles or molecules which do not carry an electrical charge, which are not de-

stroyed or broken up by an electromotive force sufficiently small not to produce a discharge in the gas, and which are not created by the recombination of ions along the tube, but are particles or molecules that are produced in the bulb by the passage of the ring discharge and make their way down quite independently of the electrical condition of the tube." The presence of oxygen seems a necessary, though not a sufficient, condition for the glow. The phosphorescent particles "appear to consist of large molecular groups formed by the spark, and which may continue in existence for some time (notwithstanding the bombardment from the molecules of the gas) in consequence of the repulsion which they must exert on molecules that approach them." C. A. Skinner (*Philosophical Magazine*, 2, December, 1901) believes that he has demonstrated by experiment that the high potential required to produce a discharge between electrodes in a vacuum-tube is due to a drop of potential between metal and gas. He has examined the conditions controlling this drop, and finds that as the anode is moved toward the cathode, the drop at the anode remains constant along the positive column, while within the Faraday dark space it first increases to a certain maximum value, and then falls rapidly to a value approximately zero in the negative glow. It remains at zero through the negative glow, but increases rapidly on entering the cathode dark space. From investigation of the effect of the area of the cathode on the drop at that electrode, the conclusion is drawn that the cathode drop may be designated as a linear function of the current density. O. Lehmann (*Annalen der Physik*, December, 1901) describes experiments to ascertain what alterations take place in electrical discharges through rarefied gases when they take place in spacious receptacles instead of the usual narrow tubes. In two large bell-shaped air-pump receivers cemented together the normal form is the glow discharge, characterized by the absence of the so-called positive column of light. The cathode is surrounded by three strata, of which the first is a seam of yellow light, while about the anode is a film of pinkish positive glow-light. At a suitable air-pressure not more than 360 volts suffice for the discharge, and the dark space is more than 30 centimeters thick. Provided the air-pressure remains unaltered, the thickness of the dark space of the cathode section decreases when the electromotive force and currents are increased, and *vice versa*. When the current comes from a condenser of large capacity, and the conducting wires are of low resistance, the discharge at a low voltage appears to be continuous, while, on increasing the voltage, sparks fill the whole receptacle with blinding white light. Even at a voltage so low that the discharge does not occur spontaneously, a magnetic field of proper strength, in a suitable position, produces brilliant discharges accompanied by a loud crackling noise. The author asserts that the material so far collected will not explain these phenomena. Either of the following three theories may be the true one: (1) The older theory that discharge consists essentially in a sudden disappearance of the dielectric condition of polarization, while positive and negative discharges alternate in quick succession. (2) A theory corresponding to the newer electron hypothesis, according to which this process represents a combination of two or more open currents of different kinds, which appear simultaneously, and by combination form a closed current. (3) Radiance is merely an accompanying phenomenon, while the current itself passes continually,

and without the production of light, through the gas, as through an electrolyte, so that the observed strata and lines exactly represent the underlying reality.

Ionization.—J. A. McClelland (Cambridge Philosophical Society Proceedings, February) describes experiments on conductivity produced in gases by the action of incandescent metals in which there are many indications of the presence not only of ions produced from the molecules of the gas, but also of ions actually given off from the hot wire itself. Thus at a pressure of 1 millimeter or less, the current when the wire is negative may be 50 times what it is when the wire is positive. Such a difference from atmospheric pressure suggests that, at low pressure, there are numerous negative ions from the wire itself. J. S. Townsend (Nature, March 6) draws the following conclusions from various experiments: The negative ions set free from a zinc plate when ultra-violet light falls on it generate other ions by collisions with molecules of air, carbonic acid, or hydrogen. The negative gaseous ions thus generated have the same properties as those generated from the zinc. Thus ions given off by the zinc plate, and those of air, carbonic acid, and hydrogen are identical. The negative ions generated by Röntgen rays in a gas are also the same, being identical in mass, free path, and charge. Thus it is possible to detach from the molecules of gases negatively charged particles, which are small compared with the molecules, and are the same from whatever gas they are removed. F. Campanile and G. di Ciommo (Elettricista, March, 1902) have investigated the discharging effect of ionized air that has passed over a volatile liquid, as compared with the same air after passing over a non-volatile liquid. The results show that the discharging effect of the ionized air is increased by the vapor of the volatile liquid. Possibly the mingled vapor has a greater conductivity than the ionized air, or the mingled vapor may be ionized.

Electrification of Air by Glow Discharge.—O. Lehmann (Annalen der Physik, December, 1901) concludes from experiments in this phenomenon that convective transfer of electricity by glow discharge at a point is not due to conductivity of the air. He finds also that an electrically charged body brought into a unipolar electrical wind does not lose its charge if it is of higher and similar potential, while in the opposite case it loses its charge completely, and acquires the opposite one. Positive and negative electrified air diffuse in the same way, and the electrification can therefore not be conditioned by the presence of free moving electrons. The convective flow fills the space around the point, but behind an insulating plate perpendicular to the lines of flow, there is a space free from electrified air. In a region in which both positively and negatively electrified air is present, the air is apparently conducting. Electric winds proceeding from two oppositely charged points combine only partially, a greater part escaping unchanged to the walls of the room.

The Arc.—C. Féry (Comptes Rendus, May 26) has measured the temperature of the crater of the voltaic arc, which represents, according to Violle, the temperature of ebullition of carbon. By extrapolation of results obtained from various physical properties, Violle obtained values ranging from 3,500° to 4,100°. The author, by application of Stefan's law, reaches a result near the lower of these limits, and has tested it with an improved form of optical pyrometer, with which he gets the values 3,867° and 3,897°. This was higher than the value deduced above, but a repetition of the

observations with graphitic carbon gave concordant values. At the temperature of ebullition, therefore, carbon does not behave as a perfectly black body.

Leakage.—M. Mache (Vienna Academy, December, 1901) finds that leakage is directly proportional to the potential of the charged body, other things remaining the same. This is contrary to the results of Elster and Geitel. In a closed vessel, where the leak from the conductor in it is tested under the same conditions, it is found gradually to increase to about the fourteenth day, after which it remains constant. The leakage is proportional to the pressure of the surrounding gas, and a rise in temperature from 16° to 60° is without influence.

Magnetism. Theory.—W. Voigt (Göttingen Scientific Association, 3, 1901) investigates analytically the possibility of obtaining from the theory of electrons an explanation of paramagnetism and diamagnetism. He assumes that the translation velocities of the electrons are small in comparison with the velocity of radiation, and also, as a preliminary hypothesis, that the electronic motions are undamped. It is then found that changes in the velocities of the electrons in consequence of the formation of magnetic fields will not give rise to magnetic phenomena. The effects of damping are then considered, and the author shows that, on this hypothesis, in a constant magnetic field, if the energy dissipated is supplied by means of any completely irregular series of impacts, so that the mean value of the energy tends to a fixed limit, the body will exhibit paramagnetic or diamagnetic properties, according to whether the mean energy of the electrons after the impacts is mainly potential or mainly kinetic.

Effect of Field on Electric Resistance.—J. J. Thomson (Philosophical Magazine, March) concludes that, on the theory that the electric current in a metal is carried by charged particles moving freely through the metal, the resistance should be increased by a transverse magnetic force. The opposite is the conclusion of Van Everdingen, whose results are based on the assumptions that the corpuscles which carry the current behave like a perfect gas; that the collisions with the surrounding molecules are similar to those between hard elastic bodies; and that the corpuscle between two collisions is free from any force except that due to the external field. Thomson states that the second assumption of Van Everdingen is not likely to be true, but that a collision ought to be regarded as consisting of a deflection of the path of the corpuscle, due to the force exerted on it by a molecule near to which it passes; on this supposition it is highly improbable that the resistance should be diminished by the field. As to the third assumption, as the corpuscles are highly charged, and within distances of less than 10^{-7} centimeters of the molecules of the metal, it is almost certain, Thomson says, that the forces exerted on the corpuscle by surrounding molecules are enormously greater than those due to the external electric field, and that at the end of its free path the corpuscle rushes into or past the molecule with which it is colliding with a velocity very large compared with that with which it started.

Stability.—M. Ascoli (Nuovo Cimento, January) has investigated the conditions under which magnetization is not affected by shock. A permanent magnet perfectly stable to shock may always be obtained by adjusting magnetizations and demagnetizations. The percentage of permanent magnetism which must be sacrificed in order

to secure such stability is greatest for iron and least for tempered steel. It is practically independent of the magnetizing force, being about 65 per cent. in iron, where it does not depend on the form of the iron. With steel it varies from 7 to about 20 with the form of the metal; with tempered steel it varies from about 0.2 to about 0.9 per cent. In tempered steel, even though the magnetization be not uniform, it is possible to attain approximately perfect stability in all points of the metal. Klemencic (*Annalen der Physik*, August, 1901) observed the moments of three permanent magnets over a period of about five months, the magnets being kept in iron cases lined with cotton to protect the magnets from shocks. During the first few days the magnets showed a small change (less than 1 per cent.), but after this the moment of each magnet remained constant within the limits of error of the experiments. These changes the author attributes to magnetization or demagnetization of the case. The experiments show that there is a great advantage in keeping magnets in iron cases.

Magnetostriction.—C. Barus (*Physical Review*, November, 1901) asserts that accepted theories of magnetostriction are faulty in ignoring viscosity. From Kelvin's work we know that mechanical strain is accompanied in solids by viscosity and slip between the particles. But magnetization produces strain; hence we should expect the phenomena of magnetostriction to involve viscosity and slip. To test the matter Barus subjects a soft iron wire to a fixed torque, corresponding to a definite deflection on a scale. If the wire be magnetized the deflection changes, and when the field is removed the final deflection is found to differ from the original one. The author finds by investigation (1) that in the presence of an impressed strain a longitudinal field produces increased rigidity and temporary set; (2) temporary and permanent set occur in twisting, just as in magnetization. H. Nagaoka and K. Honda (*Comptes Rendus*, March 3) have experimented with nickel-steels having respectively 25 per cent., 29 per cent., 36 per cent., and 46 per cent. of nickel. The first was not sensibly magnetic, and showed no change of length on magnetization; the second was sensibly magnetic, and varied in length slowly with the field; the third was strongly magnetic, and varied at first rapidly, but soon approached a limit. The fourth was intermediate between the second and third in properties. The variation in volume becomes less as the alloys are more strong in nickel. Thermal changes influence these observations very little. Thus, although the third alloy has a coefficient of thermal expansion about one-tenth as much as the second and fourth, its variations in dimensions are intermediate between those of the other alloys.

Magneto-optics.—P. Zeeman (*Royal Amsterdam Academy*, May 31) notes that instead of a negative rotation in the interior of an absorption band, as required by Voigt's theory, Corbino has obtained a small positive rotation only. He has therefore tested the question by observing the alterations shown by the interference bands of a Fresnel prism system in the neighborhood of the sodium lines, the amount of sodium vapor in the magnetic field being gradually increased, while the field is kept constant. In a field of 18,000 units, a displacement corresponding to a negative rotation of approximately 400° was observed in the case of both lines. Increasing the magnetic field will produce a diminution of this negative rotation. For very high vapor densities, however, phenomena identical with those recorded by Corbino were noted. Further experimental

work appears to be necessary to account for the phenomena observed. C. Runge and F. Paschen (*Sitzungsberichte of the Berlin Academy*, April 10) have verified for five different metals Preston's observation that lines of elements corresponding according to the series laws, are so decomposed in the magnetic field that on a scale of vibration numbers the components of corresponding lines in equal magnetic fields stand at equal distances. When the lines are normal triplets it follows, from H. A. Lorentz's laws, that in the spectra of the different elements the relation of the charge to the mass of each particle is the same; and so the different spectra appear to be due to identical particles with an intermolecular material corresponding to the respective elements. Possibly similar charged particles oscillate round their centers of gravity while the chemical molecules determine the forces with which the particles are, in the absence of a magnetic field, drawn into equilibrium. This would make the spectrum different for each element; while the decomposition of corresponding lines in a magnetic field would be equal in different spectra.

PHYSIOLOGY. General and Theoretical.

—In an address on The Relation of Biology to Medicine, Prof. J. Rose Bradford, of University College, London, adduced a few instances to show how a knowledge of biology contributes to giving our knowledge of the facts of human physiology a wider grasp. Looking at the function of respiration from the point of view of the human organism, we would necessarily conclude "that lungs are necessary, that muscles are necessary, that blood-corpuscles are necessary, that hemoglobin is necessary, and that therefore iron is necessary. If you look at this function from the point of view of biology, or of comparative anatomy, you will be able to find illustrations in the animal kingdom in which each of these several structures that I have mentioned may be absent. There are large groups of organisms without lungs, but having branchiae; there are organisms with lungs, but with no diaphragm or an incomplete diaphragm; there are animals which breathe with their skin; there are animals which have hemoglobin dissolved in the blood plasma instead of the corpuscles; and there are animals which have no hemoglobin, as, for instance, in the crustacea, where the iron-containing hemoglobin is often replaced by a copper compound. Facts such as these, which, as I say, can be acquired without any great labor, and which are of no distinct practical utility, are at the same time of immense importance to a properly educated medical man from the point of view of enlarging his conception of physiological processes in general. There are similar illustrations to those adduced as regards respiration to be adduced as regards circulation, but I will not take up your time by going into that, and I will not delay you with the very large question which is of great interest to the physiologist and to the zoologist as to whether many of the micro-organisms in the alimentary canal are not really instances of complicated symbiosis, of which one has so many illustrations both in the vegetable and the animal kingdom. It is a vexed question which this is not the place to enter into. I simply mention it as an illustration of the wider grasp afforded by an intelligent study of biology."

Prof. W. C. Halliburton, in his physiological address at the meeting of the British Association, said that the revival of the vitalistic conception in physiological work appeared to him a retrograde step. To explain anything we are not fully able to understand in the light of physics and

chemistry by labeling it as vital was a confession of ignorance and a bar to progress. It might be that there is a special force in living things that distinguishes them from the inorganic world. If this is so, the laws that regulate this force must be discovered and measured; and the author had no doubt that these laws when discovered would be found to be as immutable and regular as the force of gravitation. He was hopeful, however, that the scientific workers of the future would discover that this supposed vital force is due to certain chemical and physical properties of living matter that have not yet been brought into line with the known chemical and physical laws that operate in the organic world, but which as our knowledge of chemistry and physics increase will ultimately be found to be subservient to those laws. Where a scientific man says this or that vital phenomenon can not be explained by the laws of chemistry and physics, and therefore must be regulated by laws of some other nature, he most unjustifiably assumes that the laws of chemistry and physics have all been discovered. The recent history of science gives emphatic denial to such a supposition.

Concerning the effect of extremely low temperatures on the life of living organisms, Prof. James Dewar observed in his presidential address before the British Association that experiment indicates that moderately high temperatures are much more fatal, at least in the lower forms of life, than exceedingly low ones. In a series of typical bacteria exposed to the temperature of liquid air for twenty hours vitality was not affected and its functional activities remained unimpaired, while the cultures which were obtained were normal in every respect. The same result was obtained when liquid hydrogen was substituted for liquid air. A similar persistence of life in seeds has been demonstrated even at the lowest temperatures. The seeds were frozen for one hundred hours in liquid air, with no other result than to affect their protoplasm with a certain inertness from which it recovered with warmth. Barley, peas, vegetable marrow, and mustard-seeds were steeped for six hours in liquid hydrogen without their properties of germination being disturbed. A recent research by Prof. Macfayden had shown that many varieties of micro-organisms could be exposed to the temperature of liquid air for six months without appreciable loss of vitality, although at such a temperature the ordinary chemical properties of the cell must cease. At such a temperature cells could not be said to be either alive or dead, in the ordinary acceptance of those words. It is a new and hitherto unobtained condition of living matter—a third state. Certain species of bacteria during the course of their vital processes are capable of emitting light. If, however, the cells be broken up at the temperature of liquid air and the crushed contents are brought to the ordinary temperature, the functions of luminosity are found to have disappeared. This fact indicates that luminosity is not due to the action of a ferment—*luciferase*—but that it is essentially bound up with the vital processes of the cells, and dependent for its production on the intact organization of the cell. The attempts to study by frigorific methods the physiology of the cell have already yielded valuable and encouraging results.

The results of statistical investigations undertaken to determine—regarding the common belief that men of great ability have larger heads than the average population—whether any head meas-

urements, and if so, which ones, are correlated with intellectual capacity, were communicated to the Royal Society by Prof. Pearson in January. The author pointed out that though the professional classes are more intellectual and have larger mean head capacity than the hard-working classes, this did not lend any support to the current notion; for the professional classes are better developed physically, and the difference is probably due only to difference of nurture. In order to investigate the matter, a homogeneous class should be taken. The author had pursued his investigations among the undergraduates of the University of Cambridge. The men were divided into two groups—honors men and poll men—and fourfold tables were made from, 1, cephalic index and degree; 2, length of head and degree; 3, breadth of head and degree. No marked correlation was disclosed between ability and the size or the shape of the head. The problem was next worked out in the light of measurements made in schools, the measurements being all reduced to correspond with an identical age, the twelfth year being chosen as the standard. The pupils were divided, according to the records furnished by their teachers into the two classes of intelligent and slow. The results were in complete agreement with those drawn from the studies of the Cambridge undergraduates. The comparisons were continued in more complete detail with the Cambridge men, with the conclusion, from the whole study, that there is in the general population very insignificant correlation between ability and either the shape or the size of the head.

In his lecture on Catalysis and Catalysts, Prof. Wilhelm Ostwald spoke of enzymes as to be looked upon as catalysts which are in the organs during the life of the cell, and by the action of which it discharges the greatest part of its duties. Digestion and circulation were from beginning to end regulated by enzymes; and the fundamental life-activity of most bodies—the acquisition of the necessary chemical energy by combustion in atmospheric oxygen—takes place with the definite cooperation of enzymes, and without this would be impossible; for free oxygen is very inert at the temperature of organisms, and without an acceleration of the reaction the maintenance of life would be impossible. Emphasis was placed by Prof. Ostwald upon catalysis as a very important physiological factor. The older chemistry had proved unproductive in the explanation of physiological phenomena, and it seemed as if chemistry and physics were unable to contribute anything decisive toward solving the riddle of life. But it was the author's full conviction that by means of the later advances of chemistry, there lay before physiology a department no less important than that which was brought about by Liebig through his first applications of chemical science.

Circulation.—Hemoglobin and its derivatives in the animal system have for many years been regarded by physiologists as occupying a somewhat analogous position with that of chlorophyll and its derivatives in the vegetable kingdom. The view may be said to be the outcome of recent chemical and spectroscopical research. Thus these complex organic pigments produce characteristic absorption bands in the ultra-violet part of the spectrum. It has lately, however, been shown by MM. L. Bier and L. Marchlewski that this fact is not apparent in the spectra of all the derivatives of the coloring matter of the blood (hemoglobin); for these observers have demonstrated by photographs of the spectra of bili-

rubin, biliverdin, urobilin, and proteinchrom that the characteristic bands in the violet part are absent. But from this observation it must not necessarily be inferred that these organic pigments are not derivatives of hemoglobin, for, as the investigators named point out, the characteristic absorption bands in the violet area of the spectrum produced by the complex molecule of hemoglobin may not depend on the constitution of the nucleus forming the basis of this completed mother substance, but may arise from certain atomic groups which do not appear in some of the derivatives.

In a paper read before the British Medical Association on the Action of Certain Hemolytic Agents on Nucleated Blood-Corpuscles, Prof. Stewart observed that mammalian red blood-corpuscles presented certain properties which at first sight appeared to be vital phenomena, and yet were certainly of physical origin; for example, selective absorption. Thus ammonium chlorid was taken up by the corpuscles, while sodium chlorid was not; and this happened in formaldehyde-hardened corpuscles as well as in living ones. In this research, the author had shown that similar phenomena were found in the nucleated corpuscles of amphibia, birds, fetal mammals, and the corpuscles of bone-marrow. Of special interest were the observations on the corpuscles of *Necturus*, a tailed amphibian with very large corpuscles.

Experiments are described by Swale Vincent and William Sheen which go to show that nervous, muscular, glandular, and other animal-tissue extracts produce a fall of blood pressure when injected into the circulation. Whether or not the depressor substance or substances are identical in the different extracts, the authors are not prepared to say.

Appearances in liver which had been injected with acid carmine gelatin from the portal vein are described by E. A. Schäfer as seeming to offer objective proof of the conclusion of Browicz that a network of nutritive canals exists within the hepatic cells, which are in direct communication with the lobular blood capillaries. Browicz had not been able to verify his conclusion by injection, as Schäfer believes has been done in this case.

A method of estimating the oxygen and carbonic acid in small quantities of blood and the apparatus through which it is applied are described by Joseph Barcroft and J. S. Haldane in the *Journal of Physiology*, vol. xxviii, No. 3.

From investigations of the local reaction of the arterial wall to changes of internal pressure, W. M. Bayliss demonstrates that the muscular coat of the arteries reacts, like smooth muscle elsewhere, to a stretching force by contraction, and to a diminution of tension by relaxation. These reactions are of myogenic nature, are independent of the nervous system, and can be observed not only in the living state, but in expired arteries several hours after death.

Digestion.—Prof. W. C. Halliburton, in his address to the section of physiology of the British Association, cited, in illustration of the value of bold experimentation, the work of Pawlow, who had, by the introduction of new and bold methods of experiment, thrown a new light upon the processes of digestion. He had shown that digestion is not a succession of isolated acts, but each act is related to its predecessor and to the act that follows it. The process of digestion is thus a continuous whole; for example, the acidity of the gastric juice provides for a delivery of pancreatic juice in proper quantity into the intes-

tine; the intestinal juice acts upon the pancreatic, and so enables the latter to perform its powerful actions. Further, the composition of the various juices is admirably adjusted to the needs of the organism; when there is much proteid to be digested, the proteolytic acidity of the juices secreted is correspondingly high, and the same is true for the other constituents of the food.

In experiments on the nerve movements and innervation of the stomach, Dr. Page May found that a short time after the taking of food by the animal movements of a rhythmic character arose in the wall of the organ. These movements were waves of contraction, each of which began near the esophageal end of the stomach. The waves succeeded each other at the rate of about three per minute; and slowly increased in strength as they passed toward the pylorus. The contractions originated in the wall of the organ itself; for they continued for half an hour or more after removal of the viscus from the body and its preservation in a bath of warm saline solution. The small ganglia in the wall of the stomach probably coordinated the contractions. Although the gastric contractions were of autochthonous origin, they were subject to the control of the central nervous system by means of the vagus nerve, especially of the left vagus nerve. On stimulating the peripheral end of the vagus nerve, the tone of the gastric muscle was usually at once much diminished. Any gastric contractions were then usually abolished. Shortly after this, on the contrary, renewed movements set in, often very vigorous in character, and usually about four times as powerful as the contractions during ordinary digestion activity. Thus the first effect of stimulation of the vagus was inhibition of the gastric tone, the second increase of tone and augmentation of movement. Substitution of the central end of the vagus produced a slight inhibitory effect upon the stomach if the other vagus nerve was intact. The splanchnic nerve was not found to exert any influence upon the musculature of the stomach, either in the direction of augmentation or of inhibition. Occasionally some inhibition of gastric movement was excited by the stimulation of the splanchnic. Anemia of the stomach experimentally produced by blocking the thoracic aorta cut short the normal contractions of that organ. The cerebral centers for the gastric movements and tone, which have been described by many observers, notably by Bechterew and Opendowsky, were not found, although diligently searched for. No definite effect upon the movement of the stomach seemed to result from any central stimulation.

The researches of W. Ramsden indicate that urea has a potent influence upon proteids. Its presence up to saturation prevents the coagulation by heat of all proteid solutions examined. Globulin, caseinogen, acid and alkali albumin, copper albuminate fibrin, and even heat-coagulated proteids swell up and dissolve in a saturated aqueous solution of pure urea. Dry gelatin is dissolved at room temperature until 40 per cent. is in solution. If the urea is removed by dialysis the gelatin sets solid again. Coagulable proteids are converted at room temperature into a substance possessing all the properties of acid or alkali albumin according as the reaction of the original proteid solution was alkaline or acid. The presence of urea enormously accelerates the conversion of proteids into either acid or alkali albumin, and even causes such conversions when none would take place in its absence. Similarly urea facilitates the conversion of hemoglobin into alkaline hematin or acid hematin. The

presence of urea has a marked accelerating effect, greater as the amount increases up to about 10 per cent., upon the digestion of fibrin by pepsin, HCl (0.3 per cent. HCl), or by trypsin. In much larger quantities it has a retarding influence. A saturated solution of urea is a valuable histological reagent. By its reaction on the connective tissues it greatly facilitates the separation of a tissue into its individual elements—that is, cardiac and skeletal muscle, lens-fibers, fat cells—and except in the case of the connective tissue and possibly of the nerve-fiber, there is no danger of its action being too energetic or going too far. The properties of urea combined with palmitic acid are considered in the paper. The basic character of urea shown by its combinations with various acids suggests that it is acting as a base; but the fact that even in markedly acid proteid solution urea exerts a specific effect upon proteids makes this explanation improbable. The numerous definite crystalline compounds formed by the union of urea and mineral salts suggest that it may act by combining with the natural salts of a proteid and so give us an ash-free proteid. Electrolytes exert an influence antagonistic to some of the effects of urea upon proteids. The effects of urea upon proteid may be described as: 1. Those of a substance *sensibilisatrice*, rendering the proteid more prone to zymolysis, conversion into acid or alkali albumin. 2. Protective, since coagulable proteids are not heat-coagulable in its presence, but reacquire their coagulability when the urea is removed by dialysis. 3. Solvent.

Continuing the account of his investigations at the meeting of the British Medical Association, Dr. Ramsden said that a dead frog placed in saturated urea solution soon became transparent and shortly fell to pieces. The myeline sheath of nerve was rapidly altered and presented similar appearances to that of degeneration. Urea converted native egg-white into a jelly. The author at first supposed that urea in these reactions was active as a base, but further experiments negated this view—for example, urea was equally active on proteid in acid solution. Dr. Ramsden considered that it might act by rendering the proteid more sensitive to the action of any acid or alkali present. He had prepared crystalline compounds of urea with proteids and palmitic acid.

An inquiry by Messrs. Atwater and Benedict into the nutritive value of alcohol, reported in the proceedings of the National Academy of Sciences, concerned the value of alcohol as a fuel in the human body, and a comparison of it as to this point with sugar, starch, fats, and other nutritive matters in ordinary foods; and also the effect of alcohol upon the proportion of nutritive substance digested from food with which it was taken. More than 98 per cent. of the alcohol taken by the subjects was found to be oxidized in the body, and its potential energy to be converted into kinetic energy as completely as that of ordinary nutritive matters. Alcohol seemed to be effective in protecting the body fat from consumption, but less so in the protection of body protein. A slight advantage was found by the authors in favor of the non-alcoholic diet as regards the utilization of the total energy of the food, especially in cases involving hard muscular exertion, but the difference was very small, and did not exceed the possible limits of experimental error.

Dr. Arthur Cloppatt, of Helsingfors, has reported to the Congress of Finland Physicians concerning a series of experiments he has made on the

effects of alcohol upon the weight of the body. His conclusions were: 1, That alcohol, when the system has become accustomed to it, supplies the place of both nitrogenous and non-nitrogenous food by rendering a smaller amount necessary; and 2, that it has no demonstrable action in promoting the absorption of food from the intestine. The author in his paper cites the older authorities on the subject, such as Tiedemann, Gmelin, and Lallemand, as having believed that alcohol was excreted unburned from the economy; and the later experiments, including those of Anstie, Binz, and Strassmann, as having shown that it is to a certain extent destroyed in the body by oxidation.

From the researches of Drs. Osborn and Zobel, as communicated to the British Association, it appears that glycogen when hydrolyzed by a diastase ferment gives rise to bodies very similar to those derived from starch. Among these is the body called isomaltose, which was shown by Brown and Morris to be a mixture of maltose and a dextrin-like body. When acted upon by saliva glycogen gave dextrin, dextrose, and maltose.

The experiments of E. Weymouth Reid on the intestinal absorption of solutions go to show that a physical explanation of absorption is not admissible.

Glands and Secretions.—A crystalline body of constant composition has been obtained from the suprarenal gland by Jokishi Takamine, who, on account of its extremely potent action as a vasomotor constrictor, was led to believe it the active principle of the gland, and named it adrenalin. It is a white, light, microcrystallized body; assumes fine forms; has a slightly bitter taste; is sparingly soluble in its dry form; has a faintly alkaline reaction; and combines with various acids to form salts. It is a powerful reducing agent in alkaline and neutral solutions, and absorbs oxygen from the air. It may be used as a photographic developer. The author observes that the isolation of the active principle of the gland seems to point toward the fact that the wonderful physiological actions of the various glands may depend upon the effects of apparently simple chemical substances. Such isolation would naturally give an impetus to the search for active principles of the various organs concerning which we know but little.

Experiments illustrating the importance of the adrenal glands to life are described by Dr. Hans Stehl and Dr. Otto Weiss in Pfüger's Archiv. The investigations of Tolstoi and Nothnagel, who thought these glands were not essential, were regarded as liable to criticism, because the authors had not made sure of the absence of accessory adrenals. The authors found structures of this kind in rabbits. Operations of total extirpation were performed on dogs, cats, mice, a hedgehog, a weasel, and frogs. Experiments made on animals from which only one adrenal was removed were uniformly fatal in guinea-pigs, but other animals did not seem to suffer much inconvenience. In animals that died after both glands had been removed, the symptoms were great muscular weakness and apathy; the gait was vacillating, the legs were strangled, and the head was depressed, the temperature fell slowly, the blood-pressure was diminished, and where both adrenals were removed, it fell till the death of the animal. Transplantation of the adrenals, even into parts that were highly vascular, was never successful. It was difficult to determine certainly the cause of death. Some attributed it to loss of nervous power; others to the failure of supply of a substance secreted or produced by the adrenals which, entering the blood, keeps up the blood-

pressure; and others to the accumulation in the blood of some deleterious substance, and weakening of the blood-pressure, which is ordinarily destroyed by the adrenals.

Prof. Schäfer and Dr. Magnus, of Heidelberg, have found as to the effects of intravenous injection of extract of pituitary body upon the activity of the kidneys, that the epithelial part of the pituitary body causes a marked increase in urinary secretion. That part of the gland had always previously been supposed inert. It is urged that the diuretic action now proved to be excited by the gland has a direct bearing upon the disease called acromegaly, in which the pituitary body is enlarged and diuresis is present.

In an investigation of the histological and chemical position of iron in the spleen, Dr. W. Brodie, of Edinburgh, by the use of microchemical methods, found the metal contained in the cells and also in bodies not of a cellular nature. Three varieties of iron-containing elements are described in the author's paper as belonging to the latter class; and besides these, three proteid bodies containing iron which had been obtained by means of purely chemical methods.

The conclusions drawn by Prof. Ludwig Aschoff, of Göttingen, from experiments concerning the origin of urine albumin tend to confirm Merten's researches and to support the view that the albumin present in nephritic urine is derived from the blood, and is different from the specific kidney albumin. According to the results hitherto obtained a difference appears to exist between the blood serum albumin and the kidney epithelium albumin. On the other hand, the investigations of von Dungern, Moxtet, Metchnikoff, Schützen, and others, point to the existence of a relationship between the proteid constituents of the different epithelial cells as well as of the blood-cells, inasmuch as the injection of one kind of cell may yield a serum that acts on several species of cells.

In a paper read at the annual meeting of the British Medical Association, July 30, after pointing out that the formation of lymph might be considered in its relation either to the blood or to the tissues, Mr. F. A. Bainbridge passed on to deal with the relation existing between the tissue activity and lymph formation. He said that in the case of the submaxillary gland, the liver and the pancreas increased accretion—that is, increased metabolism invariably led to increased lymph formation. The possibility of the formation of lymph being due to altered capillary pressure and permeability was excluded, and it seemed probable that the lymph was formed as a direct result of the metabolism. The author supposed that during metabolism crystalloid bodies were formed in the tissues; these passed by diffusion into the lymph, raised its osmotic pressure, and therefore attracted water from the blood, the result being an increased flow of dilute lymph.

Among the results obtained in other experiments by Bainbridge respecting the formation of lymph in the liver was the fact that the intravenous injection of moderate quantities of sodium taurocholate or of pure hemoglobin leads to an increased flow of lymph from that organ, and to increased metabolic activity of the liver cells.

Representations having been made by some authors that sugar in recognizable quantities had been found in liver after it had been boiled free of that substance, and the conclusion seeming a difficult one to understand, experiments were made by F. W. Pavy and R. L. Siau with the liver of the cat and of the rabbit. The results in both cases were the same, and induced the conclusion that in a sterilized state no sugar is formed in

liver substance when it has been subjected to thorough boiling.

The Muscular System.—Two kinds of muscular soreness have been determined in the ergographic experiments of Mr. Theodore Hough. One kind is very marked during work, and may be noticeable for two or three hours afterward. It then passes entirely away. The other kind is not noticed at all at the time of the tracing and for some time afterward. It usually begins about eight hours after the work, increases to a maximum which may occur from ten to twenty-four or even more hours later. Indeed this soreness may not make its appearance till the second day after the tracing. It gradually passes away, but may be noticeable for four or more days. The first kind of soreness would seem to be due to the same causes as those which produce fatigue, namely, the presence of the diffusible waste products of exertion. There are reasons for supposing that the second kind of soreness is fundamentally the result of ruptures within the muscle.

Presenting the results of a series of experiments relating to the mechanism connecting the muscular apparatus with the centers for willed movement having their seat within the brain, Prof. Schäfer compared the relative effects of transection of the pyramidal tracts and of the vertical columns of the spinal cord. His observations had been made upon monkeys. Section of the vertical column of the spinal cord had been found to produce paralysis of voluntary movement in the parts of the body lying behind the segmental level of the lesion. The descending fibers of the vertical column of the cord were in the main derived from the cells of the nucleus of Deiters in the bulb, a group of fibers that were, on the other hand, related to the impulses entering the brain from the labyrinth organ, namely, the semicircular canals and the otolith organ. It had been proved by Ewald and others that the destruction of the labyrinth organ entailed diminution and impairment of the tonus of the voluntary muscles of the body.

The Nervous System.—In his presidential address before the American Neurological Association, Prof. Joseph Collins reviewed the most important work done in neurology during the year. The neuron theory, he said, which to-day stood as the basis of all neurology and neuropathology, in spite of criticisms and of the most elaborate histological investigations, had become more firmly established than ever. Recent researches, notably those of Apáthy and Bethe, were explained as not really antagonistic to it. All investigations tended to show that ontologically the nervous (or nerve elements) became more intimately united in series, and that such intimacy was structurally heightened by use. There were, however, many obscurities still surrounding the question of the growth of axis-cylinders in relation to the cell bodies or trophic centers, which required to be cleared up. There also remained for solution the question whether in the human cerebral cortex the presence of the dendritic cell-processes and the neuroglia sufficed to account for the relatively large separation of the active cell-bodies, or whether a certain amount of intercellular substance remained which accounted for the appearance in question.

In the field of central localization, the results obtained by Horsley and Beevor through the methods of local electric stimulation of the cortex in the higher anthropoid apes had been corroborated and extended by Sherrington and Grünbaum. Flechsig, in the latest of his wonderful researches on the association centers of the human brain,

was able to show that from thirty to forty "areas" or centers could be mapped out in accordance with their times and rates of development. Important confirmation of the same had come from the researches of Schäffer, of Budapest, and Storch, of Breslau, on general paralysis. Much attention had been devoted to the study of tendon reflexes, the most important and valuable discovery in this direction being the so-called Babinski reflex, which is now accepted as a definite indication of degeneration of the pyramidal tract. The subjects of toxemia and of internal secretion were receiving more attention, and further investigations in these directions were needed to elucidate the pathology of exophthalmic goitre, acromegaly, and allied disorders. Quite recently, Prof. Mills, of Philadelphia, had shown that the Röntgen rays were of use in determining the site and occurrence of certain cerebral tumors. Dr. Henry Head had published a suggestive report upon visceral diseases and the mental changes accompanying them, and there was still great room for the further elucidation of such neuroses as hysteria, neurasthenia, and hypochondriasis, in which mental diseases coexist. On the whole there had been more than usual activity in the realm of neurology; and questions of vastest importance were still awaiting solution.

An important research has been published by Prof. Karl Schäffer, of Budapest, on the Topography of the Cortical Degeneration in General Paralysis of the Insane. The author regards his observations as tending to support Flechsig's Association Centers of the Brain, and concludes that the morbid process (degeneration of medullated nerve-fibers) affects chiefly those centers, viz.: those in the prefrontal, parietal, insular, and supracallosal regions of the hemisphere. "The cortical degeneration in general paralysis is not an irregular, diffuse process, but, on the contrary, a regular, localized, selective, morbid affection of the cortex."

At the suggestion of Prof. Halliburton, a research was undertaken by R. H. C. Gumpertz into the specific gravity of the brain. It had especially in view the statement made by Sir James Crichton Browne "that he had found the specific gravity of the female brain less than that of the male brain, the difference being in the gray matter. The most complete previous research on the subject appeared to be that of Danilewsky, who found the specific gravity of the brain to be 1.038; that of the gray matter, 1.033; and that of the white matter, 1.041; and the average thickness of the gray matter, 2.5 millimeters. The author, experimenting upon a larger number of cases of healthy men and women who had suffered from no brain disorder, found as the average specific gravities in the respective parts of the brains of seven men—frontal, 1.0352; Rolandic, 1.0365; occipital, 1.0356; the whole brain, 1.0361; and in six women—frontal, 1.0360; Rolandic, 1.0368; occipital, 1.0365; the whole brain, 1.0364. These results are somewhat lower than those given by Danilewsky; they show considerable variations between the specific gravities of different parts of the same brain and of different brains in both sexes; and indicate that the average specific gravity is practically identical in both sexes. A low specific gravity of brain does not imply poor quality, for the part which is most important and most active—the gray matter—has a lower specific gravity than the white matter.

Specimens exhibited to the British Association by Dr. John Turner in illustration of a paper on some new features in the intimate structure of the human cerebral cortex showed: 1, A beaded

network enveloping the pyramidal cells of the cortex and the dendrites; and 2, an intercellular plexus of the nerve-fibers not previously demonstrated to exist. The preparations demonstrating these points had been made by placing pieces of the brain tissue directly on removal from the body, and without previous hardening or fixing, into a strong solution containing methylene blue and hydrogen peroxid. From this mixture, after a sufficient time had elapsed, the tissue was transferred to a solution of molybdate of ammonia. The tissue was then, after this fixation, dehydrated, embedded in paraffin, and cut into sections. The beaded network was a network, not of neurological fibers, but of processes of true nerve-cells. It loosely invested the pyramidal cells and their dendrites. It was made up of the fiber ramifications of stouter fibers which could be traced from certain pyriform dark cells in the cerebral cortex. The cells were generally small, and exhibited no signs of any network around them. There seemed, in fact, to be in the cortex of the cerebrum at least two systems of nerve-cells—the pyramidal variety, which were pale under the method of examination employed in the experiments, and the smaller darkly stained pyriform nerve-cells. The latter possessed branches which ramified and produced by a fusion a true network formed by actual anastomosis. The system of dark cells constituted a *continuum*.

The hypophysis cerebri is described by E. von Cyon in Pflüger's Archiv as having a double function; it controls intracranial blood-pressure and regulates metabolism. The former function is affected mechanically by the circumstance that every increase of blood pressure in the brain constitutes a stimulus to the hypophysis and is followed by an increase in the strength and a slowing of the cardiac beats with a slight rise of extracranial pressure. Those rarer and stronger beats of the heart which Cyon names "action pulse," augment the rapidity of the venous blood current, especially in the veins of the thyroid body, and thus remove from the brain the abnormal quantity of blood. There is reason to believe that the same effect is in part due chemically to the production of substances which are probably two in number, one of which excites vagal centers, while the second excites the accelerators. The action-beats caused by these coincident and harmoniously acting antagonistic agents are highly favorable to the rapidity of the venous blood-current. The influence exerted by the hypophysis and its secretions on metabolism is also probably effected by their action on the vagi and the sympathetic nerves, and is indicated by increased circulation and a diminution of the body weight. Persistent stimulation of the hypophysis, especially by electric currents, is followed, as a secondary effect, by violent epileptiform convulsions, which are most easily explained by regarding them as disturbances of the circulation in certain parts of the brain. A great increase in the secretion of urine is observed in all cases of stimulation of the hypophysis.

Prof. W. C. Halliburton and Dr. T. W. Mott introduce a paper on the regeneration of nerves by referring to two opinions prevailing on the subject: one that the new nerve-fibers sprout out from the central stump of the divided nerve; the other that they are of peripheral origin. Those who held the latter view relied on histological evidence. But a strand of cells that looks like nerve-fiber might not be physiologically nerve-fiber, inasmuch as it might not be capable of being excited as true nerve-fiber is, or of conducting nerve-impulses as a nerve-fiber can do. These

functional performances were the true criteria for nerve-fibers. Among recent observers, Howell and Huber, who had used both histological and experimental methods, had arrived at the conclusion that the axis-cylinder, the essential portion of a nerve-fiber, had an exclusive central origin; they admitted that the peripheral tissues in which it was embedded were active in preparing and generating a nutritive scaffolding for it. The authors had obtained experimental results which, so far as they at present went, confirmed these views.

The truth of the view, which has long been generally held, that repeated or excessive activity caused fatigue of nerve-endings, but had no effect upon the fibers that conduct the nervous impulses, has been questioned by Herzen, who asserted that after a nerve-trunk had been subjected to repeated stimuli the subsequent response of the nerve showed signs of impairment when examined by electric tests. Observations of this impairment made by Prof. Gotch have shown that it was a change confined in its situation to the neighborhood of the place of the electrodes by which the electric currents used for fatiguing the nerve were applied to it. Were the effect a true fatigue effect, its locus should not be confined to the electrode region, but should be distributed throughout the nerve; because the process of conduction of nerve-impulses occupying the whole length of the nerve, the true fatigue which arose as their after-effects must have a similar distribution. The changes which were confined to the immediate neighborhood of the electrodes by which the long series of fatigue-producing currents were introduced, were those to which much attention has long been devoted as electrotome. Probably the process involved was one of electrolysis, and certainly its relation to fatigue in the true sense was at most extremely remote.

T. Grigor Brodie and W. D. Halliburton, having observed that the assertion that the nerve fibers are incapable of fatigue rests on the excitation for long periods of time of medullated fibers, determined to repeat the experiments, with some modification, on non-medullated fibers. Selecting the nerves leading to the spleen, they found that even after many hours of stimulation no evidence of fatigue could be demonstrated. Nevertheless, they obtained proof that certain non-medullated as well as medullated fibers are injuriously affected by prolonged faradic stimulation, and that the spot which has been excited is no longer excitable until a considerable period of rest has elapsed.

Prof. C. S. Sherrington and Dr. A. S. Grünbaum, describing before the British Medical Association the experiments they had made upon the motor cortex in anthropoid apes (13 chimpanzees, 2 orangs, and 1 gorilla), mentioned as a most important point brought to light in their researches that the excitable motor region, though extending deeply into the Rolandic or central sulcus, did not extend on to the free surface of the post-central convolution—an observation that was in opposition to the results of previous observers. The authors gave the movements obtained from their different areas broadly as follow: In the face area—eye, eyelid, nose, jaw, vocal cords, mastication, and also movements of the mouth and tongue; in the arm area—shoulders, elbow, wrist, fingers, and thumb; in the leg area—toes, ankles, knee, hip; in each case from above downward. Movement of the arms was obtained by stimulation just at the border between the external and mesial surfaces of the hemisphere. A further difference from the result of other observers on the anthropoids was the case with

which epileptiform convulsions were obtained from the cortex. The authors had first studied the results of ablation of parts of the cortex and found that marked paralysis occurred from even a small lesion, but that this was recovered from; and they had also observed almost complete recovery after double extirpation of the arm area. Prof. Sherrington had also investigated the direct pyramidal tract in the anthropoids, and found that in the chimpanzee a vertical pyramidal tract occurred as in man, and was also, as in man, of a very variable individual character.

The paper of Prof. Sherrington and Dr. Grünbaum was followed by an account by Dr. Campbell of his studies of the histological features of the cortex of anthropoid apes. The author enumerated as special characters which he had found in the motor region: 1. The possession of a well-marked zone or tangential field. 2. A supradiating field. 3. A radiary zone of great depth and richness in nerve-fibers, or of great "fiber wealth"; further, there were large ganglion-cells or cells of Betz in this region. These histological results were in complete accord with the experimental results of Sherrington and Grünbaum, as the motor type of structure was bounded posteriorly by the fissure of Rolando and did not extend into the post-central convolution.

The importance of cholin in blood in cases of nerve degeneration, not only in such diseases as general paralysis, but in various diseases of the central and peripheral nervous system, is shown by Dr. T. W. Mott and Dr. W. D. Halliburton in an article on *The Chemistry of Nerve Degeneration*. The detection of cholin, which is a product of the decomposition of lecithin, is effected by a chemical test—the obtaining of the yellow octahedral crystals from the blood; and also by a physiological test, viz., a temporary fall of pressure when it is injected intravenously in animals. Degenerate nerves of animals were examined by the Marche reaction, which consists of a mixture of osmic acid and Miller's fluid, by which degenerate nerve-tissues are stained an intense black, while healthy fibers are not stained.

Almost all the experimental evidence with regard to the localization of cortical centers has been obtained from observations on monkeys and lower animals; and except for the work of Beevor and Horsley upon the orang-utan no observations have been made on anthropoids. Sherrington and Grünbaum, however, as a result of some more extensive work on the same subject, have recently in part confirmed and in part modified our previous knowledge.

The presence of a facial reflex, sometimes known as the extraorbital reflex, has of late attracted considerable attention. The manifestation is produced by striking some part of the forehead, and is followed by contraction of the orbicularis, with more or less movement of the eyelids. It is generally found that on tapping the frontal region contraction of the orbicularis takes place on both sides. The path for the reflex passes centripetally through the fibers of the supraorbital nerve to the sensory nucleus of the fifth nerve, and thence to the nucleus of the upper branches of the seventh nerve on both sides. Macarthy, in the *Neurologisches Centralblatt*, says that he found the reflex present in 100 normal persons investigated. Further observation is required to decide whether this is a true reflex or not, and also to show what significance may be drawn from its presence or absence. Dr. Walker Overend has called attention to the fact that he had previously described this reflex in the *Lancet* of March 7, 1896.

The idea has often been put forward that where an organ has a nerve-supply from two sources, the two sets of nerves must have actions which are physiologically antagonistic. The results made known in a paper by C. H. Fagge detailing researches on the innervation of urinary passages in the dog, taken in conjunction with previous work by other observers on the same subject, show that, in the case of those organs, the difference between the two sets of nerves (sympathetic and sacral) is morphological rather than physiological.

Narcotic effects have been found by Dr. Hermann Beyer to be exerted by odorous substances on the sensory and motor nerves of the frog. When the animal was made to breathe air charged with odors, the succession of events resembled that of chloroform narcosis in there occurring a preliminary state of excitation followed by motor and sensor paralysis. A considerable number of the substances experimented with, which are named in the author's paper, acted quickly and strongly, while others were less active. The frogs were placed near a sponge or wad wet with the odorous substance, but not in contact with it. Heat, respiration, and muscular power were affected. Special experiments indicated that the absorption of vapor is effected to a larger extent by the skin than by the lungs, and that the impaired excitability and coordinating power resulting have a central origin. Experiments on the direct action of odorous substances showed a loss of excitability on the part of the nerve exposed, extending gradually upward and more slowly downward.

Special Senses.—A communication has been published in the New York Medical Record by Prof. G. E. de Schweinitz on Deleterious Results of Certain Common Drugs and Narcotics on the Organs of Sight, in which the results of observations of the author's practise during recent years in the ophthalmological department of the Philadelphia Hospital are recorded. The most important form of functional visual defect or amblyopia noticed was produced by quinin. It was manifested in different ways and degrees varying with the doses and with the idiosyncrasies of the patient. With moderate doses, temporary dimness of sight occurred. When the doses were large (60 to 80 grains a day), the affection assumed a second and more serious form. Blindness of sudden onset and almost complete in degree resulted, and lasted several days. Ophthalmoscopic examination showed great pallor of the optic disks and blanching of the retina. Quinin in large doses also had toxic effects on the ganglion-cells of the retina. This quinin blindness is described as similar to that caused by salicylates or by antifebrin, and the actual changes are very similar. Iodoform when absorbed from dressings of wounds and burns, or after administration by the mouth, occasionally produced amblyopia. Alcoholic amblyopia was produced by ordinary alcohol, and in a more intense degree by methyl alcohol; and substances in which methyl alcohol was an ingredient had a similar effect. Certain strong forms of tobacco, particularly if smoked in a pipe or on an empty stomach, were specially liable to give rise to amblyopia. Usually, however, several years passed before the vision was thus affected; while an indescribable haze or fog seemed to obscure the view. Pallor of the optic disk and central scotoma for red and green in the field of vision were observed. If the patient was intemperate, the disease progressed more rapidly. The histological investigation showed that the retinal ganglion-cells in the macula lutea

underwent degeneration; and some change could be detected in the macular fibers of the optic nerve. Which of the active principles in tobacco was the actual agent was not determined. Among the forms of amblyopia due to occupation were those occurring among lead-workers and india-rubber workers (in whom the effect was produced by the carbon disulfid used as a solvent for the rubber). Amblyopia was also met with as a result of being exposed to or inhaling fumes of nitrobenzene or dinitrobenzene, a substance which is produced in chemical factories, and is commonly known as essence of almonds.

The photosensitive pigment, or visual purple, which is supposed to belong to the rods only, and not to be present in the cones, has been found by Dr. F. W. Eldridge Green present in the central region of the retina, in which there are cones only and no rods. On examining the retina of the monkey when the animal had been kept in the dark for twenty-four hours in order to increase the amount of visual purple, the central region of vision, the yellow spot, instead of being free from the pigment, was the most purple spot of the whole retina. The purple was, however, seen by microscopical examination to be around and not actually within the cone. The author advanced the theory that the cones were sensitive only to changes in the visual purple, not to light itself.

At the annual meeting of the British Medical Association Dr. F. W. Eldridge Green described his view of the origin of a visual impulse as being that light falling upon the retina liberated visual purple from the rods, and this, being acted on by light, stimulated chemically the cones and an impulse was transmitted along the visual path to the brain and received by a light perceptive center which did not appreciate color but simply light and shade. Color perception was due to a special center separate from the visual center, but closely connected with it, a color being simply a point of difference capable of being seen by this center.

Observations are described by Dr. C. S. Myers as having been made by means of tuning-forks concerning the smallest musical tone-difference perceptible to the people of Scotland and those of Torres Straits. But little difference in the original capacity to distinguish tones was found between the children of Murray island and those of Aberdeenshire; but with practise the Scottish children improved very rapidly and uniformly. The adult Murray Islanders for the most part failed to detect intervals of a semitone. The average difference of frequency of vibration just distinguishable by them was 15 vibrations per second; while for the adult Scotch examined it was 9 vibrations.

In the third volume of the Journal of Physiology, p. 22, Sir W. R. Gowans described a case of disease which suggested strongly that the path for taste reaches the brain by the roots of the fifth nerve, both as regards the front and the back of the tongue. Since the article was published the author has met with strong confirmatory evidence from cases of disease. But he regards such evidence as unimportant when compared with the proof of the fact supplied by the modern surgical procedure of the removal of the Gasserian ganglion and the adjacent part of the fifth nerve, known as Krause's operation for neuralgia. Five cases of operations are adduced in the author's paper in the Journal of Physiology (vol. xxviii, No. 4), 4 cases by Mr. Horsley and 1 by Mr. Ballance, these being the last consecutive cases in which the operation was

performed. In some earlier cases taste was not tested, so that as far as the observations of this group of authorities go the result has been constant. Mr. Horsley is quoted as representing that in the cases he has operated on in private in which he has afterward tested taste, he has in each case found it lost. These facts are regarded as constituting strong evidence that the suggestion of disease was correct, and that all the fibers of taste, at least in most persons, reach the brain by the fifth nerve. The path by which the taste impressions reach the fifth nerve deserves further investigation, but hardly lends itself to experimental research.

Miscellaneous.—The results of studies of the effect of marching and carrying of loads, as in military service, upon 5 students of the Kaiser Wilhelm Academie have been published by Prof. Zuntz, of the Royal Agricultural College, Berlin, and Chief-Surgeon Schomberg. The experiments were made during April, May, June, and July, under stated and uniform regulations, and the condition of the subjects was examined before and after, and sometimes during the march and on days of rest, with reference to all organs and functions likely to be influenced by carrying heavily loaded knapsacks. The tests included sphygmographic tracings, enumeration of blood-corpuscles, estimation of the specific gravity of the blood, reaction of the muscles and nerves, measurements of vital capacity, and records of variations in urinary constituents. A second and more complicated investigation was carried out with two of the students to determine the effect of marches on metabolism. Experiments were also made with lighter weights and with loads of 22, 27, and 31 kilograms. The general condition of the students improved, excessive fat disappeared, and the body weight was reduced by from 1.5 to 3.5 kilograms; the cardiac systole was prolonged and the diastole was shortened as the weights carried were increased. The pulse increased to 140 and 150 beats a minute, and diastolism became marked as the duration of the diastole and systole approached equality.

Among 89 observations the cardiac area of dullness showed marked increase in 64, and the hepatic area in 67 instances after march. The increase in the area of dullness was found due to dilatation of the right and not of the left side of the heart, and to be produced by a general stagnation of the venous circulation. The phenomenon is designated by the authors as "march dilatation of the left side of the heart." Observations on other organs and functions did not produce so interesting and positive results. The specific gravity of the blood increased only by 0.006, and the red blood-corpuscles by 9 per cent. after the heavier march. An apparent increase in the white corpuscles was due to polynuclear cells being carried into the circulation from the walls of the larger veins in consequence of increased cardiac action; but the blood resumed its normal condition on the day following the march. The vital capacity of the lungs was increased up to a certain point by graduated training, but marked diminution occurred in the marches with the heaviest loads, the result being associated with the dilatation of the heart and liver and the venous stagnation already noticed. The increase in frequency of respiration associated with exercise gradually fell to normal during halts, but when dilatation of the right side of the heart had become well marked the increase remained as high as 40 per cent. above normal even after a halt of thirty minutes. The heat production of the work done in marching

was estimated to be enough to raise the bodily temperature 1° C. in 8.7 minutes. From experiments on the influence of marches on nervous energy-producing material, the authors conclude that in continuous heavy marching the carbohydrates consumed in the rations are not sufficient to replace the waste; and that a day's rest is required after every three days' marching to enable the blood to recover its normal power. It is understood that the German military authorities have accepted the investigators' conclusions as authoritative; and the regulations on physical training in Germany are evidently inspired by them.

A general review of the results of the researches of Ehrlich and his colleagues and followers on the subject of immunity was given by Prof. W. C. Halliburton in his address at the British Association, who said that the power the blood possesses of slaying bacteria was first discovered when the effort was made to grow various kinds of bacteria in it, it having been looked upon as probable that the blood would prove a suitable medium for the parasite. Instead, the blood was found in some instances to have exactly the opposite effect. The chemical characters of the substances which kill the bacteria were not fully known; but absence of knowledge on this particular point had not prevented important discoveries from being made. So far as was known at present, the substances in question were proteid in nature. The bactericidal powers of blood were destroyed by heating it for an hour to 56° C. Whether the substances were enzymes was disputed; so also was the question whether they are derived from the leucocytes. The substances are sometimes called alexins, but the more usual name now applied to them is *bacterio-lysins*. Closely allied to the bactericidal power of blood or blood-serum, was its globulicidal power, by which it is meant that the blood-serum of one animal has the power of dissolving the red blood-corpuscles of another species. The bactericidal power of the blood was closely related to its alkalinity and increased with it. Normal blood possessed a certain amount of substances which were inimical to the life of our bacterial foes. When a person gets "run down," as it is called, and is weak against attacks of disease, it is coincident with a diminution in the bactericidal power of his blood. But even a perfectly healthy person has not an unlimited supply of bacterio-lysin, and if the bacteria are sufficiently numerous, he will fall a victim to the disease they produce. But in the struggle he will produce more and more bacterio-lysin, and if he gets well it means that the bacteria are finally vanquished, and his blood remains rich in the peculiar bacterio-lysin he has produced, and so will render him immune to further attacks from that particular species of bacterium. Every bacterium seems to cause the development of a specific bacterio-lysin. Immunity can more conveniently be produced gradually in animals, and this applies not only to the bacteria, but also to the toxins they form.

In the hypothesis by which he seeks to explain the phenomena of immunity, Ehrlich supposes that the toxins are capable of uniting with the protoplasm of living cells by possessing groups of atoms like those by which nutritive proteids are united to cells during normal assimilation, and which he terms heptophor groups; while the groups to which these are attached in the cells are termed receptor groups. The introduction of a toxin stimulates an excessive production of receptors, which are finally thrown out

into the circulation, and the free circulating receptors constitute the antitoxin. The comparison of the process to assimilation is justified by the fact that non-toxic substances like milk introduced gradually by successive doses into the blood-serum cause the formation of antistances capable of coagulating them. Evidence is gradually being collected that other cells than those of the blood may by similar measures be rendered capable of producing a corresponding protective mechanism.

In connection with some experimental researches in the metabolism of pulmonary tuberculosis Dr. Francis W. Goodbody, Dr. Noel D. Bardswell, and J. E. Chapman made studies of the metabolism of ordinary individuals, and of the effect of a greatly increased diet on them. Three cases were experimented upon, the conditions of which and their treatment and regimen are described in detail in the paper of the authors in the *Journal of Physiology* (vol. xxviii, No. 4). The conclusions which seem to the authors justified by the results are expressed by them as follows: 1. The lasting bad effects of an excessive diet on normal individuals. 2. The very small quantity of nitrogen retained except when extreme forced feeding is employed. 3. The increased quantity of urine passed and of very high specific gravity, more or less proportional to the increased intake of fluids, this being contrary to what has been observed in pathological conditions. 4. The marked increase in the quantity of total nitrogen in the urine on forced feeding, the portion of this substance passed as urea remaining normal all through, and there being no marked difference in the proportion of uric acid and ammonia. 5. The marked increase in the inorganic constituents of the urine analyzed during the period of forced feeding. 6. The fact that, contrary to what was to be expected, there was no marked increase in the total quantity of nitrogen in the feces on the forced feeding except in case 3, while, as a rule, there was an enormous increase in the quantity of fats. 7. The temporary increase in the absorption of nitrogen on forced feeding as against the tendency to diminution in the rate of absorption of fats during the same period. 8. The very rapid increase in weight during the period of forced feeding and the very striking rapidity with which this increase disappeared. 9. The marked deterioration of health caused by forced feeding.

In studies regarding the depth of sleep, Dr. Sante de Sanctis and Dr. U. Negroz applied a method of tactile and pressure stimuli for six consecutive months, on each of 9 subjects, 4 of whom were normal and 5 psychopaths, afflicted with some form of nervous disorder, the tests being made at different hours on successive or irregularly recurring nights. It was found that the maximum depth of sleep was attained within one hour and a half after falling asleep, and generally in the third half-hour; after which the curve of sleep became shallower. Hourly oscillations in the depth of sleep occurred thereafter with a maximum and a minimum for each hour, the curve, however, descending on the whole for a while until a second deepening of sleep occurred. This secondary deepening lasted about an hour and a half, and occurred during the middle period of the total duration of sleep. In all the 5 pathological subjects the depth of sleep was far greater than in normal persons. It was found that dreams occurred in every period of sleep, and even in the earlier hours when the depth of sleep was greater; but they were more frequent and more vivid in the later hours of

sleep, especially toward morning. The dream activity of psychopathic persons was slight as compared with normal subjects, and the memory of the dreams was less marked or definite.

A prize of 600 kronen, or about \$1,050, is offered by Prof. Joseph Seegen, under the auspices of the Mathematical and Natural Science section of the Imperial Academy of Science of Vienna, for the best answer to the question: Whether any part of the nitrogen of the albuminates which have undergone metabolism in the animal body is eliminated either by the lungs or the skin in a gaseous form. Essays may be sent in before Feb. 1, 1904, in the German, French, or English language.

In experiments on skin currents, Dr. Augustus D. Waller found that in freshly removed human skin the normal current was always ingoing, and the response to electrical excitation by the induction-coil was always outgoing. This response, which the author calls "the blaze," was a sign of the vitality of the skin, was independent of the normal current, and amounted to from 0.0100 to 0.0400 volts. Moribund skin and skin from the post-mortem room gave small reactions of variable direction, amounting to not more than 0.010 of a volt. In all cases the electrodes were carefully tested and the skin was subsequently killed by boiling, tested, and found to give negative results. A remarkable feature brought out in the experiments was the great diminution of resistance of living skin by tetanization. The resistance of dead skin was far below that of living skin, and was not altered by tetanization. Fatigue was exhibited more in human skin than in frog's skin. As regards the locality of the reaction, the blaze currents were found to arise exclusively from the Malpighian layer of the epithelium, not from the superficial keratinized cells, or from the subcutaneous tissue and the corium. The blaze reaction was quite local, and was not propagated to any considerable distance from the excited spot, and adjacent portions exhibited different degrees of vitality. The apparent duration of vitality was surprising, and lasted as long as ten days after excision. Alternations of temperature produced alteration of resistance as in any moist conductor. In the case of living skin, Dr. Waller witnessed at the moment of congelation (-40° to -60° of the cooling chamber) a sudden electromotive discharge of 0.0080 volt, attributable to the sudden excitation of living matter in the act of congelation. On the return of the frozen skin to the original temperature, the resistance was found to be much reduced, and the response to excitation was abolished.

Indications were found by Uhlenbarth, and the discovery has been confirmed by Levene, of the existence of a biological relationship between the blood and the muscle proteids—a similarity in the biological sense having been observed between proteids having a different chemical individuality, but obtained from the same animal. It was found that the serums of rabbits immunized for two months with milk would form precipitates with milk, casein, milk-albumin, and beef-serum, but not with the entire white of an egg, egg-albumin, egg-globulin, chicken-serum, and sheep hemoglobin. Serums of animals that had been treated with injections of the white of an egg for two months formed precipitates with egg-albumin, egg-globulin, yolk of egg, chicken-serum, and turkey-serum. No precipitate was formed on the addition of milk proteids, beef-serum, or of the different proteids of the latter, of guinea-pig serum, or of serum of the normal rabbit.

In the meeting of the National Academy of Sci-

ences, April, 1902, Prof. J. McKean Cattell read a paper showing that Mosso's method of experimenting upon psychophysical fatigue by causing the subject to lift a dead weight from the ground and calculating the amount of work according to the product of the mass into the height to which it is lifted, is open to the objection that much effort is exerted before the weight is stirred. The author had avoided this objection by experimenting upon pulls against a spring. Under this method, the strange anomalies in Mosso's results had completely disappeared.

The nature of the cerebro-spinal fluid has been the subject of an investigation by Prof. E. Cavazzani, of the University of Ferrara, who has published his first results in the Italian Archives of Biology, 1902, fasciculus 1. The determination of alkalinity by lacmoid gave as the mean in the dog, 0.093 per cent. of NaOH, and in the ox, 0.104 per cent., the blood being obtained from animals killed by bleeding. In other cases the fluid was obtained during life by aspiration through the atlanto-occipital ligament. In dogs that were curarized, the mean was 0.089 per cent. NaOH, and in two normal rabbits it was 0.099 and 0.085 per cent. These numbers are important for the evidence they afford that the cerebro-spinal fluid is not a mere filtration of the plasma of the blood, since it presents less than half the alkalinity of the blood. The evidence afforded by the effects of various reactions, such as those of tincture of guaiacum, hydrochinone, gallic and pyrogallie acids, peroxid of hydrogen, and orthotolidine led the author to the conclusion that the cerebro-spinal fluid contains a ferment, to which he has given the name of cerebro-spinose. This ferment possesses the power of destroying the reducing agent which is normally present in the cerebro-spinal fluid, and is capable of oxidizing glycose. Prof. Cavazzani adduces reasons for supporting the views of Knoll, attributing variations of pressure in the cerebro-spinal fluid to various influences. At the beginning of asphyxia there is a diminution, but subsequently an increase occurs, of pressure in the fluid; and if the central stump of the vago-sympathetic nerve is stimulated in the dog, the fluid ceases to flow through a fistula. The results of the author's investigations have convinced him that the cerebro-spinal fluid is a true secretion and is not lymph in the ordinary sense of the word. As additional evidence he has studied the action of the substances termed "lymphagogues" by Heidenhain—namely, peptone and the extract of the heads of leeches, glycose, and chlorid and iodid of sodium. In no instance was there any acceleration in the flow of the cerebro-spinal fluid from fistulous openings.

An investigation of the cerebro-spinal fluid was suggested to St. Clair Thomson, M.D., of the Throat Hospital, London, by the observation of a young woman in good health suffering from its escape through the nose. The author examined the literature of the subject and found about 20 similar observations recorded. The liquid was not diagnosed in all the cases as cerebro-spinal fluid, but its identity with it seemed indubitable in 9 of the cases, very probable in 12, and possible in 18. In many of the cases the hydrorrhea was associated with cerebral symptoms and with optic neuritis. In particular cases under the author's own care, cerebro-spinal fluid was determined by analysis by Dr. Halliburton. Accounts of these cases, with observations on the composition and functions of the cerebro-spinal fluid, are given by the author in a book which he has recently published on the subject.

A preliminary report on Heredity in Alcoholism, by Dr. T. D. Crothers, chairman of a committee of physicians appointed at a Medical Temperance Congress in 1888, embodies the results of the investigation of 1,744 cases of inebriety carried on during thirteen years. The facts were carefully ascertained and collected, and the inquiry, besides the question of heredity, included every condition and circumstance which could have an etiological bearing in the development of inebriety. Of the 1,744 inebriates with trustworthy histories, 1,080 had a direct history of alcoholic heredity; 390 cases were traceable to bodily diseases, injury, or shocks; 180 were attributable to starvation and poisoning; while 85 cases were due to ignorance, bad surroundings, and imitation (or mental contagion). In only 9 cases were the causes so complex or so obscure that no classification could be made of them. The central conclusion from the study was "that the injury from alcohol to the cells and nerve-tissues is transmitted to the next generation in some form or other—as a drink-craving, a neurosis, or a mental defect, etc.—with absolute certainty." Regarding the 1,080 patients with a direct alcoholic heredity, the report says: "In most there seemed to be largely transmitted a special predisposition to find relief in spirits, or a mental diathesis [instability] with want of self-control, and often a species of psychical pain and unrest, which found the greatest relief from the use of spirits." In 430 of the cases no heredity was traced.

A study by Dr. R. Hunt, of Johns Hopkins University, of the relative toxicity of methyl alcohol and the special pathological changes produced by its action on the nervous system gave results indicating that while coma of ethyl alcohol lasts perhaps not longer than six hours, or twenty hours at the most, that from methyl alcohol may last two, three, or even four days. Experiments on lower animals showed that this was not due to impurities, but that the pure drug would produce the same effect. In lethal doses methyl alcohol produced death more speedily than ethyl alcohol. But in chronic intoxication methyl alcohol was retained longer in the nerve-tissues than ethyl alcohol. Hence small doses taken a few times acted very poisonously owing to their cumulative effect. Dogs to which measured doses of pure and commercial methyl alcohol were given died, as a rule, while those treated with equal doses of ethyl alcohol recovered. Dr. Hunt was able to establish proofs of degenerative changes in the optic nerve and blindness in the fatal cases, a result which might occur also in the human subject from small and non-fatal doses of methyl alcohol. The whole series of experiments showed that however pure methyl alcohol may be it is totally unfit for use as a substitute for ethyl alcohol in any preparation that is to be taken medically or dietetically.

PORTO RICO, a dependency of the United States, ceded by Spain to the United States by the treaty signed by peace commissioners at Paris on Dec. 10, 1898. Representative government was conferred on the people on May 1, 1901, and a Legislative Assembly was elected by popular suffrage limited by moderate property and educational restrictions. A tariff of 15 per cent. on imports from Porto Rico into the United States and imports from the United States into Porto Rico was imposed by the United States Congress by an act passed on April 12, 1900, the proceeds to be applied to the necessities of the government of Porto Rico. The Legislative Assembly enacted a system of local taxation suf-

ficient for the needs of government, and after it had gone into operation passed on July 4, 1901, a joint resolution notifying the President of the United States that the aid was no longer needed, in consequence of which the President on July 25, 1901, proclaimed the cessation of all tariff duties between Porto Rico and the United States. The Governor of Porto Rico is appointed by the President of the United States. Charles H. Allen, appointed Governor on May 1, 1900, at the institution of local self-government, was succeeded on July 23, 1900, by William H. Hunt, whose official staff at the beginning of 1902 was composed as follows: Secretary, Charles Hartzell; Attorney-General, James S. Harlan; Treasurer, W. F. Willoughby; Auditor, John R. Garrison; Commissioner of Education, Martin G. Brumbaugh, succeeded by Samuel M. Lindsay; Commissioner of the Interior, William H. Elliot. The Resident Commissioner of Porto Rico in Washington is Federico Degetau, reelected Nov. 4, 1902. The Executive Council is the upper house of the Legislative Assembly and the popularly elected House of Delegates the lower. The Governor and the chief American officials with 5 native Porto Ricans appointed by the President constitute the Executive Council. The House of Delegates has 35 members. A Supreme Court was instituted, with José S. Quinones as Chief Justice and Louis Sulzbacher, of Missouri, and José C. Fernandez, José M. Figueras, and Rafael Nieto y Abeille, Porto Ricans, as associate judges. A United States district court was created, and William H. Holt was appointed Federal district judge. The Spanish code of laws was continued, with modifications recommended by a special commission bringing it into harmony with the laws of the United States. Gov. Allen resigned, and William H. Hunt, of Montana, was on July 23, 1901, appointed his successor. The Governor and the Secretary receive instructions from the State Department at Washington, the Treasurer and Auditor from the Treasury Department. A battalion of native troops organized in 1899 has been retained in the United States service, and forms the only military force on the island with the exception of detachments of artillery in the sea forts. These native troops are to be disbanded.

Area and Population.—The area of the island is estimated at 3,600 square miles. The population in 1900 was 953,243. Many workers on the sugar plantations were induced to emigrate with their families to the Hawaiian Islands and to Cuba, and others employed in the tobacco industry went to the latter island, but this emigration was counterbalanced by immigration from Santo Domingo, Cuba, and other West Indian islands. The density of population is 264 to the square mile and the increase in population was 16 per cent. from 1887 to 1900 according to census returns. Of the inhabitants of the island 589,426, or 61.8 per cent., are white, though many of these show an infusion of African blood. The number of black and colored inhabitants is 363,817, or 38.2 per cent. The number of foreigners in 1900 was 13,872, or 1.5 per cent. of the population, and these include 7,690 Spanish residents, the great majority of the Spaniards having elected to retain their nationality. The proportion of the totally illiterate to the population in 1900 was 83.2 per cent. Education is making good progress. There were at the end of 1902 in the schools, on which \$192,896 had already been expended for buildings, 1,126 teachers, and over 55,000 pupils. The annual expenditure for education is fixed at \$600,000. Two industrial schools

were opened in the fall of 1902. San Juan, the capital, has 32,048 inhabitants; Ponce, 27,952; Mayaguez, 15,187.

Finances.—The insular revenues are sufficient for the needs of the administration, and in his message to the Legislature the Governor advised no increase in direct taxation in 1903. The sum of \$600,937 raised by tariff duties up to the time of the cessation of the special tariff on Porto Rican products was set apart as a fund for permanent public improvements in Porto Rico. Its expenditure for this purpose gave employment to native laborers and imparted an impulse to the commercial and industrial energies of the country which had been paralyzed by the interruption of the former trade with Spain and Cuba and by the effects of the hurricane of 1899. At the close of 1902, besides \$885,635 of trust funds, there was a balance on hand of \$378,670 from insular revenues and \$431,128 due from the United States.

Commerce and Production.—The most valuable product is coffee, of which 60,000,000 pounds are gathered annually from 200,000 acres. The coffee finds a ready demand in Austria, France, and other Continental countries and its superior quality is beginning to be appreciated in the United States. Coffee has constituted 63 per cent. in value of the total export trade, and sugar 28 per cent., after which come tobacco, honey, molasses, cattle, timber, and hides. The yield of coffee has been increased from 200 to more than 500 pounds an acre. The crop in 1901 was 200,000 bags. In 1902 it approximated 350,000 bags. Oranges, bananas, and pineapples are exported in increasing quantities. There is a variety of pineapple that attains the weight of 25 pounds. Bananas grown without cultivation are of fine quality. Limes and lemons grow wild in abundance. Silkworms have been raised experimentally that produce cocoons twice or thrice the ordinary size and of the finest quality, fed on a plant growing in abundance on which silkworms were already raised in Venezuela. A company has been organized to grow Sea Island and Egyptian cotton, for which the soil and climate have been found well adapted. Rice is grown on the island, but more is imported. Corn and vegetables of all kinds are raised. The sugar plantations cover 50,000 acres, yielding nearly 100,000 tons in 1900. The yield of tobacco was 3,000,000 pounds in 1901 and nearly 8,000,000 pounds in 1902. The principal mineral product is salt, of which 10,000,000 pounds are annually produced by the salt-works of Guanico, Salinac, and Cape Rojo. Gold is found, and carbonate and sulfids of copper and magnetic iron ore are abundant. Lignite, amber, and marble are other mineral products. There were 260,000 cattle in 1899. Oxen do the heavy hauling. About 50,000 cattle are slaughtered or exported annually. The grazing on the island is unexcelled. There are 130,000 acres of blue grass. Cattle are shipped to Trinidad, St. Lucia, Martinique, and Guadeloupe. Hogs thrive particularly well. Poultry is easily kept. Sugar, rum, cigars, and cigarettes are now the principal manufactures. Wood manufactures, matches, soda, and vermicelli are newer industrial products. There is unlimited water-power and cheap fuel. The plaiting of hats is a house handicraft which has expanded into a commercial industry since prices rose. Prof. S. A. Knapp examined the agricultural resources of Porto Rico with a view to the establishment of an experiment station in connection with the United States Department of Agriculture, and one has been started near Mayaguez and one

under the direction of Frank D. Gardner at Rio Piedras, near San Juan. Experiments have been begun for improving the quality and yield of coffee by selection and by proper shading of the shrubs; also in exterminating the mole cricket, which destroys young tobacco and sugar plants. Selection and fertilization of sugar-cane, rice cultivation, the fermentation and grading of tobacco, dairying, forestry methods, culture and marketing of fruits, and introduction of cacao and fiber plants are other problems that are studied. The chief imports are cotton goods, rice, provisions, codfish, and hardware and tools. The total value of imports in 1901 was \$9,367,000, and of exports \$8,634,000. Of the imports, \$7,415,000 came from the United States, \$808,000 from Spain, \$375,000 from Great Britain, \$167,000 from France, and \$152,000 from Germany. Of the exports, \$5,661,000 went to the United States, \$1,110,000 to Cuba, \$596,000 to Spain, \$473,000 to France, and \$141,000 to Germany. The total value of exports in 1902 was \$12,889,925, showing an increase of 54.7 per cent. in exports to foreign countries and 48.6 per cent. in exports to the United States. The increase was mainly in sugar, cigars and cigarettes, straw hats, and coffee. A demand sprang up in the United States for straw hats, which were shipped to the amount of \$204,500. While over \$3,000,000 worth of Porto Rican coffee went to Europe, the takings of the American market were only \$29,000. Among the imports were codfish of the value of \$400,000 from Nova Scotia and \$500,000 worth of potatoes from Spain.

Railroads and Telegraphs.—There are 159 miles of completed railroads in Porto Rico, and 170 miles are building. The telegraphs have a length of 470 miles, connecting the principal ports with San Juan, the capital, which is connected by cables with St. Thomas and Jamaica. Since the extension of the telegraphs under American administration they have yielded a profit to the insular treasury.

Government and Legislation.—Porto Rico became a Territory of the United States on July 25, 1901, but not subject to the United States Constitution. By a decision of the United States Supreme Court rendered on Dec. 2, 1901, which sustained the right of Congress to impose customs duties on Porto Rican products imported into the United States and a separate tariff for Porto Rico, the natives and citizens of Porto Rico are not citizens of the United States unless they become naturalized like any aliens eligible for citizenship. Culebra and a site at San Juan have been taken and fitted as United States naval stations, and the title, still remaining in the insular government, will be transferred to the United States by act of the Legislature.

A general election was held throughout Porto Rico simultaneously with the elections in the United States on Nov. 4. The Republican party won a victory everywhere over the Federal Democrats, obtaining every seat in the House of Delegates. In most districts the Federals, as in 1901, refused to register, complaining that the election judges would not permit free and full registration, and in some places disturbances occurred on registration day. An epidemic of smallpox caused excessive mortality among the population until the Government made vaccination compulsory, a measure that reduced the death-rate from this disease to almost nothing. Anemia has become much less prevalent with the general improvement in public and private sanitation. There were 13,000 fewer deaths in the year end-

ing June 30, 1902, than in the previous year. The criminal code adopted for Porto Rico, modeled largely on the penal laws of California, has worked satisfactorily. A new corporation law went into effect on July 1.

PORTUGAL, a kingdom in southwestern Europe. The throne is hereditary in the family of Saxe-Coburg-Braganza. The reigning sovereign is King Carlos I, born Sept. 28, 1863, successor to his father, Luiz I, who died Oct. 19, 1889. The heir apparent is Luiz Philippe, Duke of Braganza, born March 21, 1887. The legislative power is vested in the Cortes, which consists of a Chamber of Peers, containing 52 hereditary, 13 spiritual, and 90 nominated members, and a Chamber of Deputies, containing 120 members elected by the direct votes of all adult male citizens who possess an elementary education or an income of 500 milreis. The Cabinet at the beginning of 1900 was composed as follows: Prime Minister and Minister of the Interior, E. R. Hintze Ribeiro; Minister of Foreign Affairs *ad interim*, Ferdinando Mattoso; Minister of Finance *ad interim*, Ferdinando Mattoso; Minister of Justice and Public Worship, A. Campos Henriques; Minister of War, L. A. Pimentel Pinto; Minister of Marine and the Colonies, A. Teixeira de Sousa; Minister of Public Works, Industry, and Commerce, Manuel A. de Vargas.

Area and Population.—The area and population of the kingdom according to the preliminary reports of the census of Dec. 1, 1900, are given in the following table:

DIVISIONS.	Square miles.	Population.
Provinces:		
Entre Minho e Douro.....	2,807	1,173,106
Tras os Montes.....	4,393	439,170
Beira.....	9,348	1,518,406
Estramadura.....	6,876	1,232,598
Alentejo.....	9,431	413,531
Algarve.....	1,873	254,851
Islands:		
Azores.....	1,005	256,474
Madeira.....	505	150,528
Total.....	36,088	5,428,650

The population consisted of 2,597,270 males and 2,831,389 females. The increase of population in ten years was 378,930, showing an annual rate of 0.75 per cent. The number of emigrants in 1900 was 21,306, of whom 18,908 went to America, chiefly Brazil, 1,928 to Africa, 445 to European countries, and 25 to Asia and Oceania. The population of the chief towns in 1900 was as follows: Lisbon, the capital, 357,000; Oporto, 172,421; Braga, 24,309; Setubal, 21,819; Coimbra, 18,424.

Finances.—The revenue for 1902 was estimated at 53,269,747 milreis, and expenditure at 55,269,747 milreis. For 1903 the estimate of revenue was 53,991,074 milreis from ordinary and 922,000 from extraordinary sources; total, 54,913,074 milreis. The estimate of expenditure for ordinary purposes was 54,416,810 milreis, and for extraordinary purposes 1,445,128 milreis; total, 55,861,938 milreis, showing a deficit of 948,864 milreis. Of the ordinary receipts according to the estimates 13,180,960 milreis are derived from direct taxes, 6,323,000 milreis from stamps and registration, 25,172,030 milreis from indirect taxes, 1,107,750 milreis from additional taxes, 3,609,176 milreis from national property and miscellaneous sources, and 4,598,158 milreis are *recettes d'ordre*. Of the ordinary expenditures 9,716,008 milreis are for the civil list, the Cortes, etc., 20,739,311 milreis for the consolidated debt, 400,000 milreis for loss on exchange, 3,839,852 milreis for the Ministry of Finance, 2,850,692

milreis for the Ministry of the Interior, 1,076,458 milreis for the Ministry of Justice and Worship, 6,403,757 milreis for the Ministry of War, 4,188,518 milreis for the Ministry of Marine and the Colonies, 350,732 milreis for the Ministry of Foreign Affairs, 4,782,144 milreis for the Ministry of Public Works, Commerce, and Industry, 69,338 milreis for the deposit office. The receipts of the Government for the financial year 1903 showed a slight falling off, being estimated late in 1902 at about 50,000,000 milreis. The expenses increased enormously over the previous budget and over the estimates, being at the rate of 65,000,000 milreis a year. There were 2,000 more officials to be paid and the expense of the public debt was increased to 30,000,000 milreis. The bank-notes in circulation amounted to 80,000,000 milreis, and the Government intended to issue more in spite of a rising *agio*.

The public debt in 1901 consisted of £41,727,171 sterling of external 3-per-cent. consolidated bonds, £1,813,148 of 4-per-cent. and £12,745,154 of 4½-per-cent. redeemable external bonds, and £9,388,621 of tobacco bonds paying 4½ per cent., making the total external debt proper £65,874,094, besides which there were £99,922,768 of internal 3-per-cent. bonds largely held abroad, which gives a total sum of £165,596,862, not including £6,126,640 of 4- and 4½-per-cent. internal bonds and the floating debt, which on Jan. 1, 1901, amounted to 51,537,484 milreis.

The Army and Navy.—All young men are liable to military service for three years in the active army, five years in the first reserve, and seven years in the second reserve. The annual contingent fixed by the Cortes for 1900 was 16,000 for the army and 1,000 for the navy. There are 24 conscription and reserve districts in Continental Portugal and 3 in the islands. The army consists of 24 infantry regiments of 3 battalions; 3 regiments of 2 battalions, and 6 battalions of rifles, each battalion having a section of sappers, cyclists, and machine-guns attached; 10 regiments of cavalry, each of 4 squadrons; 6 regiments of field-artillery, each of 6 batteries; 2 batteries of horse-artillery; 6 groups of fortress-artillery, each of 3 batteries; 4 independent batteries; 1 regiment of engineers, consisting of 6 companies of sappers, 2 of pontonniers, 1 of telegraphists, and 1 of railroad troops; and independent of these 1 company of fortress sappers, 1 of fortress telegraphists, and 1 of torpedoists. The army under the new organization enacted on Sept. 7, 1899, and Dec. 24, 1901, has under arms 77 officers and 1,967 men in the engineers, 294 officers and 5,467 men in the artillery, 270 officers and 4,920 men in the cavalry, and 1,146 officers and 18,927 men in the infantry and rifles; total peace effective, 1,787 officers and 31,281 non-commissioned officers and men, with 160 guns and 6,479 horses and mules. There are besides 81 infantry officers and 297 men in reserve depots, 80 officers and 2,176 men in the municipal guards, and 100 officers and 4,622 men in the fiscal guard. The war effective of the active army comprises 80 engineer officers and 3,740 men, 420 artillery officers and 12,319 men, 330 cavalry officers and 7,260 men, and 1,779 infantry officers and 85,209 men; total, 2,609 officers and 108,528 men, with 240 guns and 14,487 horses and mules. The reserve troops number 1,447 officers and 62,796 men, with 96 guns and 5,113 horses and mules, making the total war strength 4,056 officers and 171,324 men, with 336 guns and 19,600 horses and mules.

The navy consists of the reconstructed iron-clad Vasco de Gama; the protected cruiser Don Carlos, of 4,253 tons, armed with 4 6-inch, 8 4.7-

inch, 12 three-pounder and smaller quick-firers and machine-guns and having a speed of 22 knots; the protected cruisers São Gabriel and São Raphael, of 1,800 tons, and the smaller Adamaster and Dona Amelia; 2 old cruisers; 20 gunboats, of 100 to 800 tons; the destroyer Tejo, of 530 tons; 18 river gunboats; the royal yacht Amelia; and 3 training-ships. The third-class cruiser Patria, built at Lisbon, was completed in 1902.

Commerce and Production.—Only 54.2 per cent. of the area of Portugal is productive. Vineyards cover 2.2 per cent. of the total area, fruit orchards 7.2 per cent., forests 2.9 per cent., pasture 26.7 per cent., cereal crops 12.5 per cent., and legumes and other crops 2.7 per cent. Wine is the chief product of the country. The wine-crop in 1902 was excessive, causing loss to growers and merchants. The Government and the wine-growers have made extraordinary efforts in recent years to produce and find foreign markets for light red and white wines, good and uniform in quality and cheap in price. Olive-oil, figs, tomatoes, onions, oranges, and potatoes are exported. The mineral products include copper, sulfur, iron, lead, tin, manganese, arsenic, anthracite coal, salt, gypsum, and marble. The total value of ores mined in 1900 was 2,116,718 milreis. There were 4,000 fishing vessels in 1900. The annual value of sardines, tunny, and other fish caught is about 3,750,000 milreis. Since the adoption of high protection in 1891 a multitude of factories has sprung up around Lisbon and Oporto, and these have increased wages and raised the general standard of living, while making the cost of living much higher and for the agricultural classes hard to bear.

The total value of imports in 1900 was 60,221,713 milreis, and of exports 32,564,035 milreis. The imports of coal were 5,547,049 milreis in value; of wheat, 4,972,665 milreis; of cotton, 4,475,926 milreis; of cotton goods and yarn, 2,996,048 milreis; of codfish, 2,821,347 milreis; of iron, 2,601,877 milreis; of sugar, 2,243,750 milreis; of leather and hides, 1,711,162 milreis; of wool, 1,457,410 milreis; of woolen goods and yarn, 1,298,086 milreis; of cattle, 1,126,036 milreis; of tobacco leaf, 569,328 milreis; of coffee, 565,818 milreis. The exports of wine were 10,628,534 milreis in value, consisting of 52,290,370 liters of ordinary wine and 30,575,720 liters of liqueur wine, this last comprising 27,575,720 liters of port and 2,620,240 liters of Madeira. Brazil, Great Britain, and Portuguese colonies take nearly all the wine. The exports of cork in 1900 were 2,464,184 milreis in value; of cotton goods, 2,136,583 milreis; of sardines, 1,228,159 milreis; of copper ore, 1,092,731 milreis; of olive-oil, 694,557 milreis; of cattle, 468,160 milreis; of eggs, 417,889 milreis; of almonds, 354,020 milreis; of horses, 346,294 milreis; of tunny, 302,513 milreis; of figs, 275,294 milreis; of pineapples, 220,797 milreis; of onions, 152,585 milreis. Imports of animals were valued at 2,831,514 milreis in 1900, and exports at 3,846,426 milreis; imports of raw materials at 27,398,746 milreis, and exports at 5,800,481 milreis; imports of textiles at 6,514,690 milreis, and exports at 2,542,418 milreis; imports of articles of food at 15,367,495 milreis, and exports at 16,365,438 milreis; imports of machinery at 3,522,438 milreis, and exports at 155,472 milreis; imports of manufactured articles at 4,016,552 milreis, and exports at 2,217,512 milreis; imports of packing material at 87,997 milreis; imports of coin and bullion at 482,281 milreis, and exports at 1,636,288 milreis. Of the total imports in 1899, amounting to 51,538,465 milreis, 33 per cent. came from Great Britain, 16 per cent. from the United

States, 14 per cent. from Germany, 8 per cent. from France, 7 per cent. from Spain, and 22 per cent. from other countries. Of the total exports, valued at 30,020,204 milreis, 27 per cent. went to Great Britain, 20 per cent. to Brazil, 19 per cent. to Portuguese colonies, 12 per cent. to Spain, and 22 per cent. to other countries. Germany and other Continental countries have displaced England in some branches of the import trade. In spite of the chronic financial difficulties of the Government foreign trade is expanding.

Navigation.—The number of vessels engaged in foreign commerce entered at Portuguese ports during 1900 was 6,226, of 9,981,765 tons; cleared, 6,224, of 9,978,553 tons. Of these the number entered with cargoes was 4,115, of 6,365,911 tons; cleared with cargoes, 4,132, of 1,256,048 tons. The number of coasting vessels entered was 4,211, of 1,301,949 tons; cleared, 4,132, of 1,256,048 tons.

The merchant navy on Jan. 1, 1900, consisted of 292 vessels, of 95,775 tons, excluding all below 50 tons.

Railroads, Posts, and Telegraphs.—The railroads in operation in 1901 had a total length of 1,464 miles, of which the Government owned 507 miles. The number of passengers carried in 1899 was 11,404,764; tons of goods, 2,430,881; net earnings, 3,539,700 milreis.

The number of internal letters, newspapers, and other mail-matter carried by the post-office during 1900 was 54,955,714; of international and colonial mail-matter, 12,275,272.

The telegraph-lines on Jan. 1, 1901, had a total length of 5,180 miles, with 11,460 miles of wire. The number of internal despatches in 1900 was 2,117,611; international despatches, 1,302,842.

Political and Financial Situation.—The Government in 1902 made an arrangement with the foreign bondholders for the conversion of the external debt by which the reduced interest on the bonds was again increased by 50 per cent. Great commotion was produced by this and the alleged general financial mismanagement of the Government. Riots were started at Oporto, and from there disturbances spread to other parts of the country. At Coimbra the students created a tumult, and the troops were insubordinate when called upon to interfere. The university was closed on May 2. Although shouts were raised for the republic, the movement was mainly directed against the ministry. The conversion bill finally passed the House of Peers by 49 votes to 35 on May 10, after which the Cortes were closed, to meet again on Jan. 2, 1903.

Colonies.—The Portuguese possessions in Asia and Africa were acquired when Portugal was a great maritime and commercial power. The colonies that remain are not commercially important and are a financial burden which is borne, as was that of Spain, from sentiments of national honor and historical pride. In recent times the Government has resorted to the plan of entrusting the development of the natural resources of the colonies to chartered companies, to which foreigners have contributed capital though their charters contain restrictions intended to safeguard their Portuguese nationality. The Minister of Finance estimated in 1899 that the Government had expended in thirty years at least 67,500,000 milreis on the colonies.

Portugal possesses Goa on the Malabar coast, Damao on the coast of Bombay, and the island of Diu west of it. Goa has an area of 1,390 square miles and a population of 494,836, among whom there is a considerable infusion of white blood. The production of salt by evaporation is the main industry, and the annual production is

about 12,200 tons. There is a railroad, 51 miles long, connecting the port with the network of British India, and grain and pulse brought in coasting vessels are conveyed into the interior. The imports by sea and land amounted to 5,483,924 rupees in 1900; exports, 1,562,287 rupees; transit trade, 5,719,122 rupees. The revenue for 1902 was estimated at 1,019,868 milreis; expenditure, 1,028,420 milreis. The military force is 1,082 men, of whom 786 are natives. *Damao* and *Diu*, which also produce salt, have a combined area of 168 square miles and 77,454 inhabitants. They are governed from Goa. *Macao* is an island at the mouth of the Canton river, where 3,106 indigenous Portuguese, 615 European Portuguese, 171 Portuguese from other colonies, 161 foreigners, and 74,568 Chinese live on an area of 4 square miles. A lively junk trade is carried on with China. The smuggling of opium and other articles has been checked by the establishment of a Chinese custom-house in the port. The manufacture of smoking opium for export to the United States and Australia was long a profitable industry, but this is now declining. The value of manufactured opium exported in 1898 was 1,387,202 taels. Most of the trade of the port is carried on by Chinamen. There is a military force of 488 men, including 164 natives. The revenue for 1902 was estimated at 627,534 milreis, and expenditure at 426,342 milreis. The total value of imports in 1900 was \$17,920,339 in silver, and of exports \$14,068,269. The colony of *Timor* was administered until 1896 from Macao, which in 1902 contributed from its revenue 32,400 milreis, making the total revenue of Timor 113,382 milreis, while the expenditure was 164,396 milreis. The Portuguese part of the island of Timor not having been delimited from the Dutch part, although a joint delimitation was provided for in the treaty of 1859, a new convention was recently concluded on this matter. The Portuguese part is estimated to contain 7,458 square miles, with a population of 300,000. There is a military force of 323 men, of whom 212 are natives. The imports in 1899 were 195,461 milreis in value; exports, chiefly consisting of coffee and wax, 134,220 milreis.

The *Cape Verde Islands*, off the west coast of Africa, have an area of 1,480 square miles, with 147,424 inhabitants according to the census of Dec. 31, 1900, of whom 68,793 are males and 78,631 females, the total comprising 3,856 whites, 94,639 colored, and 48,929 negroes. The number of foreigners was 245. The military force is 264 men, of whom 168 are natives. Coffee, medicinal plants, and millet are the chief products. The revenue for 1902 was estimated at 419,200 milreis, and expenditure at 362,328 milreis. The value of imports in 1900 was 2,843,314 milreis; that of exports, 351,948 milreis. The number of vessels that visited the ports during 1900 was 3,841, of 4,786,609 tons, inclusive of 1,424 coasting vessels. *Portuguese Guinea*, on the Senegal coast opposite the Cape Verde Islands, has an area of 4,440 square miles, with about 820,000 inhabitants. The revenue for 1902 was estimated at 126,040 milreis, and expenditure at 208,080 milreis. The military force is 247 men, of whom 143 are natives. The value of imports in 1899 was 950,828 milreis; the exports, consisting of rubber, wax, oil-seeds, ivory, and hides, were valued at 332,979 milreis in 1899 and 401,455 milreis in 1900. The number of vessels, excluding coasters, that visited the ports during 1900 was 150, of 57,007 tons. The island of *St. Thomas* and *Principe*, in the Gulf of Guinea, have an area of 360 square miles and a population, as shown by

the census of Dec. 31, 1900, of 42,103, of whom 37,776 were in St. Thomas and 4,327 in Principe, the total including 597 foreigners and comprising 1,185 whites, of whom 1,095 were males and 90 females, 279 colored, of whom 145 were males and 134 females, and 40,639 negroes, of whom 21,881 were males and 18,758 females. Principe produces about 600,000 kilograms of cacao, St. Thomas 2,250,000 kilograms of coffee. Another product is cinchona. The imports of St. Thomas for 1900 were valued at 2,037,961 milreis, and exports at 3,525,773 milreis. The number of vessels that visited the ports of the islands during 1900 was 186, of 380,115 tons. The revenue of the islands in 1902 was estimated at 526,140 milreis, and expenditure at 372,254 milreis. The military force is 240 men, of whom 181 are natives. The most important and extensive of the colonial possessions of Portugal are in the southern part of the African continent, Angola on the western and Portuguese East Africa on the eastern side (see SOUTH AFRICA).

PRESBYTERIANS. I. Presbyterian Church in the United States of America (Northern).

—The following is a summary of the statistics of this Church as they were reported to the General Assembly in May, 1902: Number of synods, 32; of presbyteries, 233; of churches, 7,748; of ministers, 7,017; of candidates, 810; of local evangelists, 123; of elders, 28,938; of deacons, 10,274; of communicants, 1,045,338; of members of Sabbath-schools, 1,063,683; of members added on examination during the year, 65,889; of baptisms, 23,279 of adults and 26,043 of infants; net increase of members during the year, 19,950; amount of contributions for the year—for home missions, \$1,203,453; for foreign missions, \$898,079; for education, \$105,301; for Sabbath-school work, \$136,757; for church erection, \$261,034; for the Relief fund, \$107,718; for the freedmen, \$145,611; for synodical aid, \$100,062; for aid for colleges, \$425,421; for the General Assembly, etc., \$84,926; for congregational expenses, \$12,575,456; miscellaneous contributions, \$1,036,373; total contributions, according to the footing of the tables, \$17,080,191.

The Board of Education reported to the General Assembly that it had met all its financial engagements without incurring any debt, but had a somewhat diminished balance. The receipts from churches, Sabbath-schools, and Young People's Societies had amounted to \$44,179, as compared with \$43,940 in 1901. The number of candidates for the ministry having been unusually small, they had been given the highest rate of allowance since 1894, and \$55,530 had been paid to 572 beneficiaries. One hundred and forty new recommendations had been favorably acted upon, and 432 recommendations renewed. Of the candidates under care, 217 were theological students, 220 college students, and 35 preparing for college. One was a Bohemian, 77 were colored men, 29 Germans, and 4 Spanish speaking. There had been a decided falling off in the number of Spanish-speaking students.

The Board of Aid for Colleges had received \$222,836, and had aided 24 institutions to meet current expenses, given interest on trust funds to 3, and helped 16 in their endowment.

The Board of Relief for Disabled Ministers and the Widows and Orphans of Ministers reported that it had had on its roll 906 cases of ministers, widows, orphan families, missionaries, and guests at its home in Perth Amboy, N. J., and had paid \$43,075 to honorably retired ministers. The names of 29 ministers had been added to the honorably retired roll, making 151 in all, of whom 11 had died. Eighty new names had been added to the

roll of annuitants. The average amount paid to annuitants on the honorably retired roll was \$285.26, and the average to annuitants not on the roll was \$180. The receipts for the year had been \$231,447, and the expenditures \$223,441. The balance in the permanent fund was \$44,801. The annuity fund amounted to \$42,385. The whole amount of investment funds was \$1,564,935.

The Board of Publication and Sabbath-School Work had 97 missionaries and 2,134 schools, in 31 of the United States, and in Cuba. The sale of books and periodicals had amounted to \$488,542, of which \$175,749 were devoted to the missionary work of the department. The report recommended the printing of literature in the Hungarian language for the instruction of parents in the training of their children.

The Board of Church Erection reported to the General Assembly that its total receipts for the year had been \$193,275, and its disbursements \$205,269. Aid had been given in the building of 259 new churches. Since the board's work was started, in 1845, 7,159 churches had been aided, with a total sum of \$4,353,492. The report embodied a recommendation that churches asking for appropriations should regard the sums granted to them not as gifts, but as loans, to be paid back in a fixed annual proportion, without interest.

The Board of Home Missions reported that the whole amount of contributions to its funds for the year had been \$884,692, and that the sums used by the self-supporting missions would bring the total sum applied to this work to \$940,295. A balance of \$4,000 remained at the end of the year. Eighty-nine churches that had been assisted had ceased to ask for aid from the board, and 430 churches had asked for smaller sums than they had received during the preceding year. Including 26 Mexican and Indian helpers, 1,350 missionaries and 490 missionary teachers had been employed, who returned 7,885 additions on profession of faith with a total church-membership of 74,457; an attendance of 84,354 in the congregations; 3,383 baptisms of adults and 3,256 of infants; 1,850 Sabbath-schools, with 116,497 members; 70 churches and 223 Sabbath-schools organized; 89 churches reached self-support; and \$120,409 of church debts canceled. The board was commended by the General Assembly for its policy of promoting efforts toward self-support by home mission churches; and the churches were advised, so far as they are able, to undertake to provide for the support of at least one home missionary.

The Woman's Presbyterian Board of Foreign Missions of the Southwest held its twenty-fifth annual meeting in St. Louis, Mo., April 24. The report showed that the board had 22 missionaries in the field, 18 of whom were supported by single societies or by individuals as a special work.

The Board of Missions to the Freedmen reported that the receipts for the year had been \$185,804, and that a balance of \$4,057 remained on hand. The freedmen's schools and churches had besides contributed \$88,254 for self-support. The receipts had been larger than for any of the eight years preceding. Nearly 11,000 pupils had come under Presbyterian influence. The number of ministers in the field had increased from 201 to 209, and the number of churches and ministers from 342 to 353.

The Board of Foreign Missions reported that its receipts for the past year had been \$1,097,636, being the largest in its history. For five years the board had reported "no debt," and each year the receipts had been larger than in the year preceding. There had also been received \$244,782

toward the payment of the mortgage on the Presbyterian Building in New York, on which only \$150,000 were now unpaid. The building was yielding a gross income, exclusive of the quarters occupied by the two boards, of \$118,130 a year. The force in the field was growing year by year, and now comprised 745 missionaries and 1,882 native helpers, with 610 organized churches, 769 schools and colleges, and 84 hospitals and dispensaries. In 77 hospitals and dispensaries under the care of the board 340,878 patients had been treated at a net cost of \$22,009. Forty-eight newly appointed missionaries had been sent out, besides 58 returning to the field, and 56 were under appointment to go out.

The General Assembly met in the city of New York, May 15. The Rev. Henry Van Dyke, D. D., was chosen moderator. The Special Committee on Revision of the Confession of Faith presented a report covering two divisions: I. Certain revisions of the Confession of Faith, in certain special parts of it, and concerning certain specified subjects, by the method of textual modification or by declaratory statement, or additional statements, to be passed upon by the Assembly for submission to the presbyteries. II. A Brief Statement of the Reformed Faith, to be submitted to the Assembly for such disposition as might be judged to be wise. In the first division, 11 overtures were proposed, to be set down to the presbyteries, as follows:

"Overture No. 1. Shall the following preamble to a declaratory statement be adopted, viz.?

"While the ordination vow of ministers, ruling elders, and deacons, as set forth in the Form of Government, requires the reception and adoption of the Confession of Faith only as containing the system of doctrine taught in the Holy Scriptures, nevertheless, seeing that the desire has been formally expressed for a disavowal by the Church of certain inferences drawn from statements in the Confession of Faith, and also for a declaration of certain aspects of revealed truth which appear at the present time to call for more explicit statement, therefore the Presbyterian Church in the United States of America does authoritatively declare as follows:

"Overture No. 2. Shall the following declaratory statement be adopted as to chapter iii of the Confession of Faith?

"First, with reference to chapter iii of the Confession of Faith; that concerning those who are saved in Christ, the doctrine of God's eternal decree is held in harmony with the doctrine of his love to all mankind, his gift of his Son to be the propitiation for the sins of the whole world, and his readiness to bestow his saving grace on all who seek it. That concerning those who perish, the doctrine of God's eternal decree is held in harmony with the doctrine that God does not desire the death of any sinner, but has provided in Christ a salvation sufficient for all, adapted to all, and freely offered in the Gospel to all; that men are fully responsible for their treatment of God's gracious offer; that his decree hinders no man from accepting that offer; and that no man is condemned on the ground of his sin:

"Overture No. 3. Shall the following declaratory statement be adopted as to chapter x, section 3, of the Confession of Faith?

"Second, with reference to chapter x, section 3, of the Confession of Faith, that it is not to be regarded as teaching that any who die in infancy are lost. We believe that all dying in infancy are included in the election of grace, and are regenerated and saved by Christ through the Spirit, who works when and where and how he pleases.

"Overture No. 4. Shall foot-notes be appended to chapter iii and chapter x, section 3, of the Confession of Faith, reading (as above)?

"Overture No. 5. Shall section 7, chapter xvi, of the Confession of Faith be changed so as to read—

"Works done by unregenerate men, although they may be for the matter of them things which God commands, and in themselves praiseworthy and useful, and although the neglect of such things is sinful and displeasing unto God, yet because they proceed not from a heart purified by faith, nor are done in a right manner, according to his Word, nor to a right end, the glory of God; they come short of what God requires, and do not make any man meet to receive the grace of God.

"Overture No. 6. Shall the last clause in section 3, chapter xxii, of the Confession of Faith, which reads as follows, be stricken out? "Yet it is a sin to refuse an oath touching anything that is good and just, being imposed by lawful authority.

"Overture No. 7. Shall the following sentence be substituted for section 6, chapter xxv, of the Confession of Faith?

"VI. The Lord Jesus Christ is the only head of the Church, and the claim of any man to be the vicar of Christ and the head of the Church is unscriptural, without warrant in fact, and is a usurpation dishonoring to the Lord Jesus Christ.

"Overture No. 8. Shall the following preamble be adopted, viz.?

"Whereas, It is desirable to express more fully the doctrine of the Church concerning the Holy Spirit, missions, and the love of God for all men, the following chapters are added to the Confession of Faith.

"Overture No. 9. Shall a chapter be added to the Confession of Faith, to be numbered chapter xxxiv, and entitled Of the Holy Spirit, as follows?

"CHAPTER XXXIV. OF THE HOLY SPIRIT.

"I. The Holy Spirit, the third person in the Trinity, proceeding from the Father and the Son, of the same substance, and equal in power and glory, is together with the Father and the Son, to be believed in, loved, obeyed, and worshiped throughout all ages.

"II. He is the Lord and Giver of Life, everywhere present in nature, and is the source of all good thoughts, pure desires, and holy councils in men. By him the prophets were moved to speak the Word of God, and all writers of the Holy Scriptures inspired to record infallibly the mind and will of God. The dispensation of the Gospel is especially committed to him. He prepares the way for it, accompanies it with his persuasive power, and urges its message upon the reason and conscience of men, so that they who reject its merciful offer are not only without excuse, but are also guilty of resisting the Holy Spirit.

"III. The Holy Spirit, whom the Father is ever willing to give to all who ask him, is the only efficient agent in the application of redemption. He convicts men of sin, moves them to repentance, regenerates them by his grace, and persuades and enables them to embrace Jesus Christ by faith. He unites all believers to Christ, dwells in them as their comforter and sanctifier, gives to them the spirit of adoption and prayer, performs all those gracious offices by which they are sanctified and sealed unto the day of redemption.

"IV. By the indwelling of the Holy Spirit all believers being vitally united to Christ, who is the head, are thus united one to another in the Church, which is his body. He calls and anoints

ministers for their holy office, qualifies all other officers in the Church for their special work, and imparts various gifts and graces to its members. He gives efficacy to the word and to the ordinances of the Gospel. By him the Church will be preserved, increased until it shall cover the earth, purified, and at last made perfectly holy in the presence of God.

"Overture No. 10. Shall the following chapter on the Gospel be added to the Confession of Faith and numbered xxxv?

"CHAPTER XXXV. OF THE GOSPEL.

"I. God, in infinite and perfect love, having provided in the covenant of grace, through the mediation and sacrifice of the Lord Jesus Christ, a way of life and salvation sufficient for and adapted to the whole race of man, doth freely offer this salvation to all men in the Gospel.

"II. In the Gospel God declares his love for the world, and his desire that all men should be saved; reveals fully and clearly the only way of salvation; promises eternal life to all who truly repent and believe in Christ; invites and commands all to embrace the offered mercy; and by his Spirit accompanying the Word pleads with men to accept his gracious invitation.

"III. It is the duty and privilege of every one who hears the Gospel immediately to accept its merciful provisions; and they who continue in impenitence and unbelief incur aggravated guilt and perish by their own fault.

"IV. Since there is no other way of salvation than that revealed in the Gospel, and since in the divinely established and ordinary method of grace faith cometh by hearing the Word of God, Christ hath commissioned his Church to go into all the world and to make disciples of all nations. All believers are, therefore, under obligation to sustain the ordinances of religion where they are already established, and to contribute by their prayers, gifts, and personal efforts to the extension of the kingdom of Christ throughout the whole earth.

"Overture No. 11. Shall any change in the numbers appearing in the declaratory statement, in the numbering of the new chapters, and in the wording of the preamble proposed in Overture No. 8, made necessary by the adoption of any or some of the above overtures, be committed to the chairman of the Revision Committee under the direction of the General Assembly?"

The understanding of the committee of the work enjoined upon it in the preparation of the Brief Statement of the Reformed Faith found expression in the following resolution, which appears in its records:

"Resolved, That it is the sense of this committee that the Brief Statement of the Reformed Faith which the Assembly has ordered us to prepare should be made with the view to inform and enlighten the people in regard to the significance and religious meaning of the Reformed Faith, and not with the view of becoming a test of orthodoxy for ministers, elders, and deacons."

The following is the Brief Statement of the Reformed Faith constituting the second part of the report:

"ARTICLE I—Of God.—We believe in the ever-living God, who is a spirit, and the Father of our spirits; infinite, eternal, and unchangeable in his being and perfections; the Lord Almighty, most just in all his ways, most glorious in holiness, unsearchable in wisdom, and plenteous in mercy, full of love and compassion, and abundant in goodness and truth. We worship him, Father, Son, and Holy Spirit, three persons in one God-

head, one in substance and equal in power and glory.

"ART. II—Of Revelation.—We believe that God is revealed in nature, in history, and in the heart of man; that he has made gracious and clearer revelations of himself to men of God who spoke as they were moved by the Holy Spirit; and that Jesus Christ, the Word made flesh, is the brightness of the Father's glory and the express image of his person. We gratefully receive the Holy Scriptures, given by inspiration, to be the faithful record of God's gracious revelations and the sure witness to Christ, as the Word of God, the only infallible rule of faith and life.

"ART. III—Of the Eternal Purpose.—We believe that the eternal, wise, holy, and loving purpose of God embraces all events, so that while the freedom of man is not taken away, nor is God the author of sin, yet in his providence he makes all things work together in the fulfilment of his sovereign design and the manifestation of his glory; wherefore, humbly acknowledging the mystery of this truth, we trust in his protecting care and set our hearts to do his will.

"ART. IV—Of the Creation.—We believe that God is the creator, upholder, and governor of all things; that he is above all his works and in them all; and that he made man in his own image meet for fellowship with him, free and able to choose between good and evil, and forever responsible to his maker and Lord.

"ART. V—Of the Sin of Man.—We believe that our first parents, being tempted, chose evil, and so fell away from God and came under the power of sin, the penalty of which is eternal death; and we confess that, by reason of this disobedience, we and all men are born with a sinful nature, that we have broken God's law, and that no man can be saved but by his grace.

"ART. VI—Of the Grace of God.—We believe that God, out of his great love for the world, has given his only begotten Son to be the Saviour of sinners, and in the Gospel freely offers his all-sufficient salvation to all men. And we praise him for the unspeakable grace wherein he has provided a way of eternal life for all mankind.

"ART. VII—Of Election.—We believe that God, from the beginning, in his own good pleasure, gave to his Son a people, an innumerable multitude, chosen in Christ unto holiness, service, and salvation; we believe that all who come to years of discretion can receive this salvation only through faith and repentance; and we believe that all who die in infancy, and all others given by the Father to the Son who are beyond the reach of the outward means of grace, are regenerated and saved by Christ through the Spirit, who works when and where and how he pleases.

"ART. VIII—Of Our Lord Jesus Christ.—We believe in and confess the Lord Jesus Christ, the only mediator between God and man, who, being the Eternal Son of God, for us men and for our salvation became truly man, being conceived by the Holy Ghost and born of the Virgin Mary, without sin; unto us he has revealed the Father, by his Word and Spirit, making known the perfect will of God; for us he fulfilled all righteousness and satisfied eternal justice, offering himself a perfect sacrifice upon the cross to take away the sin of the world; for us he rose from the dead and ascended into heaven, where he ever intercedes for us; in our hearts, joined to him by faith, he abides forever as the indwelling Christ; over us, and over all for us, he rules; wherefore, unto him we render love, obedience, and adoration as our prophet, priest, and king forever.

"ART. IX—Of Faith and Repentance.—We be-

lieve that God pardons our sins and accepts us as righteous, solely on the ground of the perfect obedience and sacrifice of Christ, received by faith alone; and that this saving faith is always accompanied by repentance, wherein we confess and forsake our sins with full purpose of, and endeavor after, a new obedience to God.

"ART. X—Of the Holy Spirit.—We believe in the Holy Spirit, the Lord and Giver of Life, who moves everywhere upon the hearts of men, to restrain them from evil and to incite them unto good, and whom the Father is ever willing to give unto all who ask him. We believe that he has spoken by holy men of God in making known his truth to men for their salvation; that, through our exalted Saviour, he was sent forth in power to convict the world of sin, to enlighten men's minds in the knowledge of Christ, and to persuade and enable them to obey the call of the Gospel; and that he abides with the Church, dwelling in every believer as the spirit of truth, of holiness, and of comfort.

"ART. XI—Of the New Birth and the New Life.—We believe that the Holy Spirit only is the author and source of the new birth; we rejoice in the new life, wherein he is given unto us as the seal of sonship in Christ, and keeps loving fellowship with us, helps us in our infirmities, purges us from our faults, and ever continues his transforming work in us until we are perfected in the likeness of Christ, in the glory of the life to come.

"ART. XII—Of the Resurrection and the Life to Come.—We believe that in the life to come the spirits of the just, at death made free from sin, enjoy immediate communion with God and the vision of his glory; and we confidently look for the general resurrection in the last day, when the bodies of those who sleep in Christ shall be fashioned in the likeness of the glorious body of their Lord, with whom they shall live and reign forever.

"ART. XIII—Of the Law of God.—We believe that the law of God, revealed in the Ten Commandments, and more clearly disclosed in the words of Christ, is forever established in truth and equity, so that no human work shall abide except it be built on this foundation. We believe that God requires of every man to do justly, to love mercy, and to walk humbly with his God; and that only through this harmony with the will of God shall be fulfilled that brotherhood of man wherein the kingdom of God is to be made manifest.

"ART. XIV—Of the Church and the Sacraments.—We believe in the Holy Catholic Church of which Christ is the only head. We believe that the Church Invisible consists of all the redeemed, and that the Church Visible embraces all who profess the true religion together with their children. We receive to our communion all who confess and obey Christ as their divine Lord and Saviour, and we hold fellowship with all believers in him. We receive the sacraments of baptism and the Lord's Supper, alone divinely established and committed to the Church together with the Word, as means of grace; made effectual only by the Holy Spirit, and always to be used by Christians with prayer and praise to God.

"ART. XV—Of the Last Judgment.—We believe that the Lord Jesus Christ will come again in glorious majesty to judge the world and to make a final separation between the righteous and the wicked. The wicked shall receive the eternal award of their sins, and the Lord will manifest the glory of his mercy in the salvation of his people and their entrance upon the full enjoyment of eternal life.

"ART. XVI—Of Christian Service and the Final Triumph.—We believe that it is our duty, as servants and friends of Christ, to do good unto all men, to maintain the public and private worship of God, to hallow the Lord's Day, to preserve the sanctity of the family, to uphold the just authority of the state, and so to live in all honesty, purity, and charity that our lives shall testify of Christ. We joyfully receive the word of Christ, bidding his people go into all the world and make disciples of all nations, and declare unto them that God was in Christ reconciling the world unto himself, and that he will have all men to be saved, and to come to the knowledge of the truth. We confidently trust that by his power and grace, all his enemies and ours shall be finally overcome and the kingdoms of this world shall be made the kingdom of our God and of his Christ. In this faith we abide; in this service we labor, and in this hope we pray."

The discussion over this report was short and showed a preponderance of sentiment in the Assembly in favor of the propositions embodied in it. The Assembly resolved that so much of the report as related to the 11 overtures be adopted with a view to the sending of the overtures to the presbyteries in due form; and that the Brief Statement be adopted and printed with the approval of the Assembly for use in the Church, "to instruct the people and to give a better understanding of our doctrinal beliefs." A report containing proof-texts of the doctrines affirmed accompanying these papers was also adopted.
